

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## Why several grades?

We make several different grades of Gargoyle Mobiloils.

The grades all differ in thickness, or "body".

These oils meet the most severe physical tests that have ever been exacted from automobile lubricating oils. In sheer lubricating *quality* they stand alone.

But that, of itself, is not sufficient.

To properly reach the many friction points the oil's "body" must be suited to your feed system.

To make this condition plainer, a homely illustration may be taken from the sewing room:

A fine thread is often too

light for the wear required. A heavy thread is often too thick to pass through the eye of the needle.

Neither meets requirements.

So it is with automobile lubricating oil.

Quality equal, the heaviest-bodied oil will prove the most durable. But to be of service it must be able to properly pass through your lubricating system.

The conditions to be met are complex. The problem is serious. Motors differ. Feed systems differ.

Before the oil which best combines durability with ability to meet the feed requirements of your car can be determined, the construction of your motor must be known and carefully considered.

To meet these conditions, we analyze each year the motor-construction of each of the season's models.

Guided by this analysis and

by practical experience we determine the correct grade of Gargoyle Mobiloil for each make of car.

Our findings we list in a lubricating chart, which will be mailed you on request.

The superior efficiency of these oils has been thoroughly proven by practical tests.

*If you use oil of lower lubricating quality or of less-correct "body" than that specified for your car, loss of power, unnecessary friction, and ultimate serious damage must result.*

A booklet, containing our complete lubricating chart, together with points on lubrication, will be mailed you on request.

## Mobiloil

A grade for each type of motor.

The various grades refined and filtered to remove free carbon, are: Gargoyle Mobiloil "A," Gargoyle Mobiloil "B," Gargoyle Mobiloil "D," Gargoyle Mobiloil "E," Gargoyle Mobiloil "Aretic."

They are put up in 1 and 5 gallon sealed cans, in half-barrels, and barrels. They are sold throughout the world. All are branded with the Gargoyle, which is our mark of manufacture. They can be secured from all reliable garages, automobile supply stores and others who supply lubricants.

## Removal Notice

To meet the tremendous increase which there has been in the demand for MULTIBESTOS BRAKE LINING, STANDARD WOVEN BELTING and SOLID MULTIPLE HOSE FABRICS a new factory has been built and equipped for the manufacture of these products on a much larger scale.

This has made necessary the abandonment of our old plant at Worcester where we have done business for many years, but where facilities were proving more and more inadequate to meet the growth and expansion of our business.

In the new factory at Framingham will be found every modern feature tending to promote quality and economy of production, not only of our present lines but of extensions which embrace everything in the way of woven fabrics for mechanical purposes.

Under such ideal conditions for doing business we can ask a continuance of orders from old customers and an investigation from new prospects with the full confidence that we can serve them to their profit and entire satisfaction.

## Our Exclusive Feature

We will (at small extra cost) furnish  
our Regular Models with the

# AUSTIN Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.  
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

|   |   |   |           |
|---|---|---|-----------|
| Model "77" Six Cylinders, 4 1-2 x 7     | - | - | \$6000.00 |
| Model "66" Six Cylinders, 4 1-2 x 5 1-2 | - | - | \$5000.00 |
| Model "55" Six Cylinders, 4 x 5         | - | - | \$4000.00 |

**MORE NEW, IMPROVED and DISTINCTIVE FEATURES** than any other car.  
Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals.

*Write for complete description and any information you may desire in regard to our two-speed axle.*

Henderson De Luxe, \$1785

## —the Money in Selling Next Year's Cars

By C. P. Henderson

The chances are—if you sell moderate-priced cars—you've seen *next year's* models at the factories.

You know then that wire wheels, kerosene-burning cars, left drive, the new center seat control, cowl dash, cowl gasoline tanks, dust-proof en bloc motors, over-size cooling and, of course, electric self-cranking systems, electric lights are what *will sell* the leaders among 1914 automobiles.

But you are still selling 1913 models—and your prospects are holding off for 1914. *You can't take a profit on them now.*

But your overhead expense goes on, your most precious asset—time—slips by; some people buy other cars at discount—money is being eaten up—*yet the business pays no profit! At the heaviest buying season of the year.*

### You Should Sell 1914 Cars Today

You ought to be offering prospects 1914 cars today!

That is the secret of making money—sell *next year's* cars that people are *waiting* for—therein lies the *money*.

This is what Henderson dealers the country over are doing today. We've been shipping since May 20.

They offer a kerosene-burning car that solves the vital fuel problem; wire wheels are optional. The logical left drive combined with the convenient *new* center seat control; cowl gasoline tank, cowl dash, oversize cooling of the dust-proof en bloc motor; oversize tires and, of course, electric self-cranking and electric lighting systems are the 1914

features you *could* offer today to your prospects who are *holding off*.

You *could* get this quick profit if you were a Henderson dealer, for they are getting it.

And, if you are the type of man we like, we would welcome a wire from you about territory—or you might write or come to the factory.

May we hear from you quickly?

## HENDERSON MOTOR CAR CO., Indianapolis, Ind.

# Another History-Making "Six"

**This new KisselKar 48 "Six" repeats the triumph of the big KisselKar 60 "Six"**

Popular response has been decisively favorable to the recently announced new model 48 "Six" which bids fair to equal the sensational introduction of the KisselKar 60 "Six," the car that pioneered the downward trend in big "Six" prices a few years ago. The *principal* reasons for the instantaneous success of the new KisselKar 48 "Six" are threefold: *appearance, mechanical perfection and riding comfort*. These three factors quickly determine the status of a new model and challenge an immediate verdict. You look at a car to feel its "personality"; you examine it to measure its mechanical perfection; you *ride* in it to *know* its *comfort*. These are the tests that quickly tell the story of the KisselKar success.

## 48 "SIX" KISSELKAR 60 "SIX"

Only a few of the very highest priced cars equal the KisselKar 48 "Six" in appearance and elegance of equipment. And it is a car of supreme comfort.

The extra liberal 132-inch wheelbase bridges the inequalities of the road, giving a special steadiness of motion. Sidesway on all but the roughest roads has been eliminated, hence no necessity for occupants to "brace" themselves in a tense, tiring position.

Big wheels and big tires absorb road vibration and reduce it to the minimum. The riding comfort of the KisselKar 48 "Six" is the result of perfectly balanced construction, every part in exact and harmonious relation to every other part.

A silent, powerful and responsive long-stroke motor, with plenty of excess power, takes you to your destination as slow as a walk or as fast as you care to go—uphill or down—without the necessity of shifting gears. The KisselKar 48 "Six" is electric lighted and started. It has left-hand drive and center control.

No other car at the price—\$2350, fully equipped—approaches the KisselKar 48 "Six" in design, power, equipment, beauty of lines and riding comfort. The KisselKar 60 "Six" at \$3150 is the dominant big car value in America. The KisselKar 40 "Four" at \$1850 is the leader of its class and type.

KisselKar models are now being shown at all our branches. Look up the dealer in your locality, or write for illustrated catalog.

### KisselKar Service Contract

The KisselKar is sold under a written guarantee of service to owners—a tangible, definite and specific contract that clearly stipulates the scope of KisselKar Service and provides for care that forestalls trouble and retards depreciation.

## Honest Now, Mr. Automobile Dealer Are You Making Enough Money?

Here's what a lot of dealers are up against. Maybe you're in this class. They are doing a good business—selling quite a bunch of cars and making a good profit, *if* they could *hang on to it*. But here's where the trouble comes in. Every time something goes wrong, (fancied or real) with the car of the customer, ting-a-ling goes the phone, or in comes Mr. Customer to have his car fixed up, and, of course, there can be no charge, because he bought it from Mr. Dealer and *he* is responsible.

Now there's just one way to dodge all this kind of trouble—get a car that doesn't need much of this kind of attention. Through all these 20 years of auto building, our one goal has been—make the Haynes perfect—make it so trustworthy and simple that it will stay in running order and give satisfaction through hard use and even abuse in the hands of unskilled drivers.

Connect up with the

# HAYNES

—the Car *without* the "Come-Backs"

We'll be glad to tell you how simple the Haynes is in every part—glad to tell you how carefully each car is manufactured in our own shops or under our direct supervision—glad to tell you the tests which every separate part, and the car complete are required to meet. We'll also be glad to tell you what Haynes dealers say as to the satisfaction given by the Haynes and how little bother they have with "come-backs."

### Specifications of the New Haynes

**Motor**—Bore 4 1-4 in., Stroke 5 1-2 in. L-head Haynes. Cylinders cast in pairs.

**Cooling**—Centrifugal pump and pressed steel fan.

**Wheel Base**—Model 26, 130. Model 27, 136. Model 28, 118.

**Ignition**—American Simms Magneto.

**Lubrication**—Splash and gravity feed.

**Control**—Left hand. Vulcan Electric Gear Shift.

**Transmission**—Selected Type, three speeds forward, one reverse.

**Steering Column**—Worm and worm gear type.

**Clutch**—Haynes contracting steel band.

**Rear Axle**—Full Floating Timken on Models 26 and 27; McCue, Model 28, Gourney Bearings.

**Front Axle**—I-Beam. O. H. steel heat treated

**Wheels**—Artillery type. Funk demountable rims.

**Tires**—Models 26 and 27, 36x4 1-2. Model 28, 34x4.

**Springs**—Front Semi-elliptic 39 1-8x2, rear 48x2.

**Brakes**—15 1-4 external and 15 internal on Models 26 and 27. 12 and 16 internal on Model 28.

**Finish**—Indian dark blue body.

**Gasoline Feed**—Pressure. Automatic feed.

**Upholstery**—Buffed leather—deep cushions.

**Starting and Lighting**—Leece-Neville electrical system.

**Dash Equipment**—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge and speedometer. Models 26 and 27 have rim wind clock.

**Other Standard Equipment**—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind-shield, Vulcan electric gear shift, two large electric head-lights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 80 ampere hour storage battery, speedometer, horn, coat and foot rails, tire irons, full tool equipment, and one extra demountable rim.

When Writing to Advertisers, Please Mention The Automobile Journal.

## The New Haynes Models Have the Season's Biggest Feature—the Vulcan Electric Gear Shift

Here's another thing a lot of dealers are up against—and maybe this also applies to you. They're handling a good car, gives good satisfaction, customers pretty well pleased, but the drawback is—there is nothing different, nothing distinctive about the car to make people go out of their way to come in and see it.

The new Haynes has a selling wallop that bring the prospects in and helps you put over the sales. In addition to everything that can be desired in the way of comfort, convenience, equipment and prestige of twenty years building—it has the wonderful Vulcan Electric Gear Shift.

Connect up with the

# HAYNES

—the Car that Is Always *First*

True to its reputation as pioneer and pacemaker, the Haynes was first to adopt this the greatest improvement in automobile equipment. Added to the electric self-starter and electric lighting, is everything else in the way of modern equipment—it makes the Haynes the strongest kind of a selling proposition. Read the specifications and see for yourself.

### Get After the Haynes Agency Today

If you are in business for money, not merely for your health—if you would like to get hold of the agency for a car that's a live seller, that's famous for its quality and dependability—that stays sold and stops the "profit-killing come-backs"—if you would like to do business with a *stand-by* and a *fixture* in the auto business, insure your business for the future—and if you would like to make the coming year *your biggest year*, write us today about the Haynes, America's First Car and the car with the wonderful Vulcan Electric Gear Shift.

**The Haynes Automobile Co., 6 Main St., Kokomo, Ind.**

M

## McCUE WIRE WHEELS

**O**NLY one tire burst in 570 mile race. Boillot, winning the French Grand Prix on a wire wheel Peugeot, blew out but one tire in the entire 570 miles. Towards the end of the race while making a stop for fuel he changed one other as a matter of precaution. The Excelsior cars, two of them, ran the entire 570 miles without making one single tire change. Commenting on the tire situation in this race "The Automobile" says: "There was very little tire trouble in the race. . . . Altogether the tire situation was very satisfactory, for this was the longest road race in the world—570 miles—and all European speed records were broken."

*Can you ask for more certain proof of the tire economy feature of wire wheels?*

Not a single wooden wheel equipped car competed in this French classic—certain proof of the confidence the world's greatest drivers have in the tire saving ability of wire wheels.

Insist upon wire wheels on your car for the reason that wire wheels

Increase tire mileage about 50 per cent.  
Safeguard your life in case of accident.  
Increase your car life.

Make an easier riding car.  
Make an easier steering car.  
Make a better looking car.

Increase your mileage per gallon of fuel.

McCue Wire Wheels are equipped with (S) spokes, made by the Standard Company, of Torrington, Conn.

# INVADER OIL

**THERE ARE ANY NUMBER OF OIL SALESMEN** but it is not always easy to believe what they tell you.

**THERE ARE ANY NUMBER OF OIL COMPANIES** who fill the pages of the magazines with advertisements of their various oils, but it is not always easy to believe what they tell you either.

**ONE OIL COMPANY** prints a list of automobile manufacturers who, it is to be inferred from the language employed, are "vigorously insisting" upon owners of their cars using this particular oil—while as a matter of fact *over 70 per cent. of these manufacturers have stated in reply to written inquiries that they either use or recommend an entirely different make of oil.*

**ANOTHER OIL COMPANY** states that their oil is superior to other oils because it will not "freeze"—while as a matter of fact a motor oil is required to stand heat, not cold. A capacity to withstand cold indicates that the oil has an asphalt base, which is probably the worst thing that can be said about a motor oil.

**ANOTHER OIL COMPANY** states that their oil is "accurately compounded and scientifically prepared"—which means exactly nothing.

**ANOTHER OIL COMPANY** states that their oil contains "no carbon" which is a physical impossibility since carbon is one of the elements of which all mineral oils are composed. (All oils must contain some carbon.)

**AND THE VERY OIL COMPANY** who claims to know the most and who ask you to use the oil they make because they are the world's foremost experts on lubrication *once had some brass tags printed and attached them to the motors of a certain make of automobile, advising the use of a black steam cylinder oil.* They might as well have recommended a good grade of glue.

**THE WHOLE TRUTH OF THE MATTER** is that a majority of both those who make oil and those who sell it either know absolutely nothing whatever about it *or else are not willing to be honest about it*, and what they say and what they print proves it.

**When Writing to Advertisers, Please Mention The Automobile Journal.**

These are the facts. An automobile oil is required to do two things—(1) lubricate and (2) burn up cleanly—and the ability of any oil to perform these operations can be absolutely determined by the employment of a few simple physical tests.

Take the gravity test as an illustration. Everyone knows that carbon in a motor oil is objectionable, and it is a well known fact that the amount of carbon in an oil is proportionate to its weight or gravity. The lighter the gravity the less carbon the oil contains, and other things being equal the better the oil will be.

To ascertain which of two oils has the lightest gravity and the least carbon is easily done. Simply take two samples of oil in glass bottles, (Invader Oil and any other) and pour a few drops of the other oil into the Invader Oil. If the other oil sinks to the bottom of the Invader Oil it is because the other oil has a heavier gravity—it will contain more carbon—it will not be so good an oil for automobile lubrication.

To say that an oil with low tests is superior to an oil with high tests is absurd. It is equivalent to saying that 5 pounds of iron weighs more than 7 pounds of iron.

An unsupported statement therefore to the effect that one brand of oil is better than another means absolutely nothing. *The fact that Invader Oils have better tests than other oils, however, means everything.*

The only question which the buyer of Invader Oil has to consider is whether or not Invader Oil is worth its difference in price. *The fact that it is better cannot be contradicted.*

---

**I-O-C GEAR OIL** is the only oil ever made especially and exclusively for the lubrication of Automobile Transmission gears. Write for prices and descriptive booklet.

## When the Repair man performs the Autopsy

he finds, nine times out of ten, that *poor lubrication* has caused all the costly havoc. Then he asks the simple question,

“Why don’t you use  
TRADE MARK  
**NON-FLUID OIL** ? ”  
REGISTERED IN  
UNITED STATES PATENT OFFICE

and he tells in his honest way what he, as a mechanic, knows about the depredations of cheap lubricants.

## Why don’t you use NON-FLUID OIL?

Get the genuine in orange colored cans.

## *Maxwell Announcement*

### This Ad Is To Dealers Direct

**D**OUBTLESS you have read our 1914 announcement which appeared in all the big daily newspapers east of the Rockies last Sunday, and will appear in all the large newspapers west of there next Sunday.

Just in passing, might mention that this is only the first of a series of big advertising campaigns. This one cost approximately \$30,000, and is just an indication of how we are going to sell the product for our dealers.

That is one of the reasons why 4,000 dealers are going to handle this line—and they will be 4,000 of the best dealers in the United States. The other reason is that the dealer who investigates will find that here is a line he cannot duplicate anywhere else.

You have had experience doubtless with handling lines of cars with various models by the same maker in different priced classes. You know what ordinarily happens. One or two of the models are ready sellers—but there is always one that drags. Always one that the sales manager tells you you must take if you are to get the others.

That is what we have in mind when we

say that the Maxwell line for 1914 cannot be equaled anywhere else.

Take, for example, the highest priced car in the line—Maxwell "50-6." Ordinarily you would expect the big fellow to be the one that would drag if any did.

We refer you to last season's experience—the season which closed August 1st—and call your attention to the fact that we were the only makers of sixes in this class who had not a car left in his factory on that date.

Price last season was \$2350. Without the slightest change—because we did not know how or where to make it better—except to give the buyer his choice of right or left hand steer—we have made the price of the 1914 model \$1975. This, with Gray & Davis Electric starter, full equipment, even to electric cigar lighter in tonneau and finished in every detail so that it puts it up to the maker of a \$4000

### 1914 Maxwell "50-6"—\$1975

The sweetest running thing on wheels. Six-cylinder motor, bloc-cast, 50 h. p. 130" wheel base; electric starter and lights; Bruce Ott body; 5-7 passengers; disappearing seats; 36"x4½" tires all 'round. Luxuriously finished, long, easy riding springs and full equipment, including ventilating windshield, top and Jiffy curtains—even an electric cigar lighter. Left or right side drive optional.

car to prove where he gives the difference in quality.

The six is a flexible proposition from a manufacturing standpoint. That is to say, we can increase or retard the production of a car of this type, so as to make 2000 or 3000 or 4000 or 5000 or 6000 of them, according as the demand develops.

With the model "25," for example, this would be impossible. It is a quantity production proposition, and if we are going to make 30,000 of them—as is our plan—we must equip for that many and we must make that many in order to make them at the price. You can understand this even if you are not a manufacturer.

As I have said, the six is a flexible proposition. We enjoyed a splendid demand for the 1913 model, at \$2350. We intended to make the price \$2400 for 1914—in fact, we said as much in our ads recently. But you have doubtless noticed there is a red-hot contest on for supremacy in this class of car—it is a rather easy class for smaller manufacturers and assemblers to get into. You have noticed some cut-throat methods of late. It did not touch us because we were sold out.

But looking the situation over, Mr. Flanders said: "We can doubtless sell all the sixes we make at \$2400. But I do not propose that our sales force shall be engaged in forcing any one model. Every car in the line must sell on its own merits and meet its own competition entirely independent of any other car in the line."

"Now, inasmuch as some folks have started something, I am going to give them a car that is known as the sweetest six on wheels, and at a price they cannot surpass and stay in business. We will just make it \$1975, and we will make it just as good as we can—and see how far the others can follow the pace."

So you see the big car—the big seven-passenger fellow—which will naturally command a lesser demand, and which you would expect to be the tardy one, will probably prove to be the leader of the line.

One thing is certain—you as a dealer can appreciate that the big, beautiful six will give class to the entire Maxwell line. The owner of a Maxwell, no matter of which model, will be proud to say he owns a Maxwell. We are not dealing with verbiage, nor using superlatives unnecessarily, because we are talking to practical men—to dealers who are accustomed to handing out enthusiasm themselves and who naturally discount everything they hear. But we want to say to you that we believe there is no other six-cylinder motor in any car, at any price, that is as well balanced or as sweet running as this six. With the full floating rear axle which we recently put under this car it is a perfect product—or as nearly perfect as engineering skill and manufacturing care can make it.

By the way, you, as the man who has to stand between the factory and the ultimate user, will appreciate this—if you did not know it before: When we found that the axle under the "50-6" was too light to hold the motor—driving pinion not strong enough, and not enough room in the housing to put in a larger one—we replaced without request, and entirely at our own expense, every rear axle under every "50-6" car that was out.

That is a mighty important point for a dealer to consider. It shows what our policy is going to be in the matter of standing back of our product—no matter which one. What we did for the "50-6" we would do for the "35" or "25" if it became necessary.

In short, the 4000 dealers who will handle the Maxwell line for 1914 will know first: That every car in the line will be the leader in its class—will dominate its class because it will be a better car for the same or less money than a buyer can find elsewhere, let him shop until he is black in the face. Second: They will know that the policy back of the \$37,000,000 concern that makes this product is based on the assumption that if we are to stay in business, and become the biggest in the business, we must back up our product to the dealer who passes it on to the buyer.

### 1914 Maxwell "35-4"—\$1085—\$1225

Powerful, silent, sweet running; bloc-cast 4-cylinder motor; 111" wheel base; 33"x4" tires all 'round. Left hand drive, center control. Electric starter and lights, at \$1225. Three-quarter elliptic springs. Bruce Ott body, ventilating windshield and full equipment, including Jiffy curtains.

While we will be second largest in the world this year, that does not satisfy us at all. We have got to be first.

Next consider the Model "35." The same wonderful bloc-cast, four-cylinder motor that was in the Everitt "36"—frankness compels us to admit that there was not much else good in that particular car. But that was not our fault. We did not make it. We acquired that proposition primarily to get two of the greatest motors we have ever known—the "50-6" and the "35-4" motors.

You cannot develop an automobile motor in a day—nor in a year—nor in two years. We have bought that knowledge with hundreds of thousands of dollars and years of experience. So we took these two wonderful motors, and we built a car that was as good all the way through as the motors themselves—the Maxwell "35-4" 1914 model which will sell at \$1085 without, and \$1225 with electric self-starter and lights, cannot be equaled anywhere else at the price.

Oh, yes, we know all about it: There are other cars of similar rating, horsepower, wheel base, and all that sort of thing, but we don't need to tell you, as a practical dealer, where the difference is. You will lift the hood and find it for yourself. If you don't find it all there, you will take a look inside the transmission case. You will find it in the beautiful body, designed by Bruce Ott. Made and trimmed as they do not make and trim bodies in the ordinary \$1200 class. We do not need to tell you the tremendous difference in cost of making a bloc-cast motor, such as this, and one with single or twin-cast cylinders.

We do not need to tell you. You know.

To let you into a little secret, our engineers started some months ago to redesign this motor so as to take \$150 out of the making and bring it down in price so as to compete with other cars that, looked at superficially, might be considered competitors—cars that, being made cheaper, can afford to be sold cheaper. There was a riot when our dealers heard of this. Our Sales Manager joined in with them and soon became the ring-leader. All protested against the slightest change in this splendid motor. And Mr. Flanders agreed.

Every man who has handled this car, or sold it, knows that such a motor is vastly more expensive to make—but it's worth it because when it is once made it is made for keeps. There is almost no limit to the life of a well-designed, well-proportioned bloc-cast motor. Being machined as a unit, everything has to be in line—and crank-case and cylinders being cast in a unit, everything has to stay in line. So you see we have another dominating car in our "35" model.

We won't have to ask you to take a few cars of this model in order to get the other—the customer who wants a car in the \$1200 class will, after looking them all over, insist on this one—and you will simply supply his demand.

And now the wonderful Maxwell "25"—the car you have all been looking for, hoping for, and wondering why some big manufacturer did not make.

Much as you know about this business, you probably did not know that the first requisite was manufacturing facilities and millions of dollars capital. On top of that, it involves the greatest engineering feat known to the industry.

Why, it's child's play to design a \$5000 automobile. If you doubt it just look back over the past and recall the hundreds of \$5000 cars you have known. They came and went—mostly because the demand for such a car was too little—and you have doubtless noticed it is getting less and less every day.

Cars like the Maxwell "50-6" at \$1975 put a crimp in that kind of proposition. The maker of a \$5000 car is on the defensive today. It's up to him to prove he has a better car. Most of them have given up trying to prove it—and built a smaller car. But they still try to get a high price for a former reputation. There's going to be some real fireworks along that line during the next few months—just watch the Maxwell "50-6."

But we were talking about the "25." Funny how we will get discussing one of these models

### 1914 Maxwell "25-4"—\$750

The year's sensation. Four-cylinder, bloc-cast; 25 h. p. motor; magneto; weight, 1600 pounds; 103" wheel base; 30"x3½" tires all 'round; 3 speed selective transmission; full five-passenger body designed by Bruce Ott; complete equipment, including tire holders, ventilating windshield; top, Jiffy curtains

and slop over on to one of the others. You see we are very enthusiastic about the whole line—each one is King in its own Principality.

We were saying it was child's play to design a \$5000 car—do you know that there is only one maker in the world who has ever been able to make a good cheap car?

No, we're not advertising the other fellow—we are just telling the truth.

We did not start out to make that kind of a car. You have told us—thousands of dealers have told us—that there were hundreds of thousands of people who were willing to pay a little more for a car that was a lot better.

A real automobile, in which the people in the tonneau did not have to rest their chin on their knees.

One that a six-foot man could drive himself without having to make a chauffeur of his four-foot-eight son.

It's funny, but seems as if more big men buy more low priced cars than any other price, so we figured that the seats had to be standard size, to fit the buyer. On top of that it had to have power plus—because you know a car like this is criticised more rigidly than a \$5000 car. To the buyer of a \$5000 car, the deal is an incident in the day's work. To the man who buys a car like the Maxwell "25" at \$750, it is a mighty important matter. He not only must consider first cost, but to a still greater extent, must he consider maintenance cost afterward. "Design for that quality as the first consideration," said President Flanders to our engineers.

Such a car must be light, and it must be strong. It must withstand anything it runs

up against. Consequently it must be made of the best materials the science of metallurgy knows how to put into it.

And finally, it has to have style and finish—because you know we are building this car for a class of buyer who, like the average American, detests a uniform and refuses to wear one even if it does cost less than regular clothes. That's the kind of car we have made in the Maxwell "25"—and we won't have to insist on your taking a carload of these in order to get a six or a "35." You will want this car on its own merits, too.

Now just a word more: We cannot hope to supply the full demand for any of these models—with the possible exception of the "50-6," which, as we stated above, is a flexible proposition. If the demand runs above 6000 of these, however, we cannot supply them. We are laying out our plants for 500 cars a day of the model "25"—but it will be 18 months before we reach that point.

During the next twelve months we will, however, make 30,000 of the Model "25"; 12,000 of the Model "35" and 2000, or as many more as you want up to 6000 of the "50-6." That makes us second largest in the world—but that doesn't satisfy us. We've got to be first. There is only one way to do that—make better cars at the same or lower prices; and—stand back of the product and the dealer. That's the only way we know and, again, we refer you to our policy, not as we speak it, but as we proved it in our acts in regard to the Maxwell "50-6."

Such a policy once known gives every dealer confidence and enthusiasm. Well, that is the Maxwell Company's policy.

## ROAD CONDITIONS IN SOUTH AMERICA.

**People Recognize That Commercial Progress Is Dependent upon Improved Transportation Facilities---Investigations Indicate That Constructive Effort Already Is Under Way---Automobile Journeys in Brazil and Argentina.**

EUROPE was compelled to build good roads for use in times of war, long before the advent of the railway, and when the people turned their attention to commerce they immediately began to reap the benefits of this highway system. In the United States the subject of improved ways is only just beginning to receive the attention its importance deserves. The country expanded largely only as railways went ahead of settlement and civilization. The value of good roads is best understood when

Mount Osorno, Chile, Possesses a Charm Exceeded by but Few of the Snow Capped Peaks of the Entire Andean Range.

comparison is made with what may be regarded as primitive conditions, and it hardly will be denied that such conditions obtain in the South American republics.

Few Americans (reference being had in this connection to the residents of the United States) are at all familiar with South America. They may be aware that the cities on the seaboard compare favorably with the best in any other section of the world. Some have visited Rio de Janeiro and Sao Paulo, in Brazil, for instance, and perhaps a single coffee or rubber plantation, and come away confident that they are in a position to judge of the possibilities. However, it must be admitted that a trip into the interior is necessary in order to discover the real agricultural and mineral wealth of the land. Such an excursion is especially valuable when the services of the railroad are dispensed

**Well Kept Streets in Pouso Alegre, State of Minas Geraes, Beautifully Situated in Well Developed Agricultural District.**

with and the visitor makes his way over the country roads and through the villages not yet reached by it.

There are still large portions of the earth's surface which remain undeveloped, but none is so large or so fertile, or shows such extraordinary future promise as the interior of Brazil and Argentina, according to those who have had the fullest opportunity to gain intimate knowledge of the situation. Although a large portion of the former country lies within the Torrid Zone, the moderate elevation renders the climate temperate and delightful, and these favorable climatic conditions, combined with a well distributed rainfall, which also applies in no small measure to Argentina, have made this section a land of unrivalled fertility. But the general commerce of Latin America will not progress as it should until good roads thread the country, sub-serving, in a local stimulus, the trunk railways that are opening the interior of every republic.

This view of the situation was accepted by South Americans less than three years ago, when the first attempt was made to study the road conditions in the interior. At that time pleasure automobiles were to be found in increasing numbers in the cities along the coast, and taxicabs were abundant in Buenos Aires and several of the larger capitals. Business vehicles also were beginning to play their part in the

development of commerce in the immediate vicinity of these centres.

Since that time, much progress has been made. Few organizations have had a wider influence in this regard than the Touring Club Argentino, which has been engaged in routing the entire section with the primary object of interesting the populace in good roads. Incidentally, this body will seek to interest tourists in visiting those districts which present scenic grandeurs as yet but little understood, so that in the end the pleasure vehicle will have had no small influence in the construction of highways that shall be utilized with profit in the transportation of

agricultural and mineral products. Manufacturers of both pleasure and commercial cars will be interested, since there is little doubt that South America is soon to offer a substantial market for the motor truck.

The Pan-American Union, with headquarters at 17th and B streets, N. W., Washington, D. C., is an international union of American republics, the main object of which is to disseminate information concerning the possibilities of Latin America in a commercial way. The governing board is composed of the secretary of state for the United States, and the ambassadors, envoys, ministers and charges d'affaires accredited to this country. John Barrett is director-general and Francisco J. Yanes, assistant director. Each month the organization issues a bulletin, under

**One of the Best Country Roads in the State of Minas Geraes, Brazil.**

Old Fashioned Ox Cart with Solid Wooden Wheels at Monte Siao, State of Minas Geraes, Main Transportation Equipment in Interior of Brasil.

the editorship of Franklin Adams, to whom The Automobile Journal is indebted for the information contained herein.

In October, 1910, an automobile was shipped by rail from Sao Paulo, capital of the state of that name in Brazil, to Atibaia, about 48 miles distant. From this point an excursion lasting 23 days was made, covering some 310 miles in the states of Sao Paulo and Minas Geraes. The object was to investigate at first hand the road conditions and their bearing upon the transportation of goods from this district.

The roads in Sao Paulo were found to be suitable only for bullock carts. In one place the way was so steep and slippery, on account of the mud, that it took about two hours to cover 50 feet, and then it was accomplished only by getting five men to assist the engine by hauling on blocks and tackle fastened to the trunk of a tree at the top of the hill. Usually the roads were very narrow and had a rut about two feet wide and two feet deep on one side. In many instances, where it was found impossible to run with the wheels on either side of this, it became necessary to fill it up entirely with earth. One such rut, 250 feet long, was treated in this manner.

In Minas Geraes, the city streets were found to be well kept up, but when these were left behind the rougher country roads were the only highways. Some of these were passable, but others were so irregular that it became necessary to make them over in places before an automobile could be operated over them.

The smaller streams were forded. Often it was found advisable to leave the highway and cut across country through fields or thin woods, wherever it was possible to avoid trees, rocks and thickets.

The country traversed was agricultural. Its products were coffee, cereals, vegetables and fruits. All of these were transported to market over the roads, as railroad communication was altogether lacking. And while the small interior towns and villages were thus isolated from each other in a measure, they were all brought into close touch

by means of several excellent telephone systems.

Contrasted with this is an account of a trip made in January of this year in company with Governor Eduardo Flordi of Neuquen territory, Argentina, from Neuquen, over the Andes into Chile. It should not be understood that the entire journey into Chile was made by automobile, although the car was driven as far as Bariloche, on the Nahuel Huapi lake, from which point the remainder of the trip to the border was made by boat. It may be added, however, that the Touring Club Argentino has outlined two automobile routes from Neuquen into Chile, one going almost directly west to Paso de Pino Hachado and the other a little more to the south, entering Chile at San Martin de los Andes. The route considered here runs almost exactly southwest, and traverses roads which had not previously been touched by a rubber tire. The conditions revealed in the report of this trip given below shows the importance attached to good roads by

Lake Nahuel Huapi, Argentina, 2428 Feet Above Sea Level, Nestles Among the Cordillera Mountains.

Governor Eduardo Elordi and the First Automobile to Cross the Wilderness Between Neuquen and Bariloche, Argentina.

the agricultural and mining interests today.

The car was rated at 40.5 horsepower, and had a clearance of 14 inches from the axle to the lowest edge of the wheel rim. It was held to be capable of making 50 miles an hour, and proved to be a good hill climber under test. In the machine, besides Governor Elordi and the investigator, were the chauffeur, another man who was an able assistant as well as a good mechanic, and a cavalry soldier whose long experience on the frontier of both Neuquen and Rio Negro (the next territory south) had made him perfectly familiar with the road and who acted as guide when any question of direction or choice of road presented itself. The story of the trip is best told by the investigator. The start was made at 5:30 in the morning.

Less than an hour after leaving the capital we crossed the Rio Limay into Rio Negro by means of a simple ferry boat suspended from an iron cable stretched over the river, which was shuttled back and forth by the action of the current. Then we struck the hard and well beaten road through the desert, barren as Arizona, but marked as a passage for oxcarts through the peculiar vegetation of a waterless plain. I cannot refrain from again remarking the close resemblance to Arizona, Texas, or north Mexico. Yet I missed the various formations of the cactus that is universal in those regions; I do not know whether the cactus grows in Argentina, but I am sure that the soil is fitted for it, and Governor Elordi told me that he had plans to introduce in Neuquen a thornless variety, which should thrive in this neighborhood and furnish good nourishment, for the mule especially, and probably for other cattle.

By 9:15 in the morning we had reached (los) Jaguelitos, a boliche, (a small house in the country at which refreshment, chiefly liquid, and small supplies may be purchased by the traveler,) the first one on the road south of and distant 16 leagues from Neuquen. (A league in Argentina is equal to five kilometers, or 3.107 miles). Here we rested awhile and tasted the water from the well that offered the excuse for the erection of the house of the proprietor. As proof of a fact that is becoming better acknowledged in all regions of this na-

ture, the soil, when watered from the well here, was quite fertile, and the proprietor was growing garden vegetables sufficient for his own needs.

The monotony of our journey through this section was frequently broken by the sight of game which would have aroused the interest of a North American sportsman. Several guanaco, the species of South American camel which is very closely related to the llama, were seen, while ostriches were quite numerous. Partridges and hares also abounded. The killing of ostriches is forbidden on many of the large estancias of Argentina, their feathers being a source of considerable revenue to the owners. These feathers are not as fine as those of the African ostrich and are chiefly used to make feather dusters.

Leaving Jaguelitos at 10 we gradually descended into a broad valley, the road giving practically no difficulty for the machine, so that it travelled easily at the rate of six leagues (18.5 miles) an hour, and even more in places. We reached another boliche—not far from a curious hill at the end of the valley, called El Cerro de la Policía—at 11:30, and here we rested and took a comfortable breakfast, furnished by the owner. Again an instance of the productivity of the soil, for this settler had discovered six years ago a spring of pure water on the side of the hill back of his house and had developed a practical system of irrigation for a garden around his home; in this he was growing luxuriously corn, onions, potatoes and similar vegetables, while his esthetic taste had led him to cultivate flowers, so that as we departed he gave us a handful of pinks (claveles), which preserved their freshness and fragrance even to the end of the following day.

It was hot in this valley, the thermometer registering 32 degrees centigrade, at midday, and no air was stirring; so we were glad to start shortly after 3 in the afternoon and catch the breeze created by the movement of the car. A good road past the Cerro brought us to another boliche named Colorado, within an hour, a distance of seven leagues (not quite 22 miles). Here Governor Elordi had had stored and ready for immediate use a quantity of petrol (gasoline), for as the road had never been travelled before by an automobile, it was necessary to provide fuel along the way, in case of need. At Colorado we stopped only long enough to transfer the gasoline to the car and then hurried on through the valley (canadon) called Tricaco. At 6 in the evening some bad road was encountered in another valley, and the next two hours made slow going, but from 8, under a brilliantly starlit sky, we hurried on again, making the night's resting place—Mencue, a good sized warehouse and store for the surrounding estancias—at 10:10, having

The Building at Pilcaniyeu Utilized by Argentine Government as School-house, Telegraph Office and Postoffice.

The First Bolliche South of Neuquen, Where Party Stopped for Rest and Refreshment.

covered this last interval, 22 leagues (68.35 miles), in three hours and 40 minutes. The entire distance travelled during this first day of the machine was therefore 55 leagues (171 miles), and by taking a short cut here and there, under the direction of the guide, we had saved about five leagues (15.53 miles) out of the 60 leagues (186.41 miles), the ordinary cart distance estimated by the natives.

Mencue is said to be the half-way station between Neuquen and Bariloche, but the longer half lay behind us, and according to the reports of those who knew the road, in reality the worst half. As we had a late supper the night after arrival, there was no great haste in the morning's start, so we did not leave the "casa de negocio" till 8:50. The night had been cold and the morning air was fresh and invigorating, the thermometer registering 16 degrees centigrade at 6 in the morning. This is accounted for by the fact that the altitude, as recorded by my aneroid barometer, was close to 1200 meters (3937 feet), the highest point on the road. (This elevation varies only slightly from the more accurate calculation for Mencue, given us later by the chart at Bariloche.)

Leaving Mencue we found an excellent road to a bolliche named Laguna Blanca, on account of a small lake near by, which dries up in the summer to expose its bed incrustated with a glistening white salt of some kind. The distance of 10 leagues (31 miles) was covered in 50 minutes. From Laguna Blanca to another little oasis in the wilderness called Cumallo is 14 leagues and required two hours and 45 minutes, our arrival being at 12:45. Here we had a stand-up breakfast, Governor Elordi deciding to spend no time in resting, although the cottage was attractive and, with water from a hill at the rear, was shaded by a pretty grove of trees.

From Cumallo, which we left at 1, to Pilcaniyeu is eight leagues (above 25 miles), and we arrived at 2:45. This place is quite a village, having a national (federal) school, a telegraph station, and a well organized industrial plant, with modern machinery for sheep shearing. In all the valleys in this vicinity flocks of sheep are numerous, and the industry seems to thrive. Pilcaniyeu is the dividing line for the eastward traffic, because from this point all carts from the south strike directly eastward toward the end of the railway that begins on the Atlantic coast at Puerto San Antonio in Rio Negro, and great hopes are expressed that within a short time this railway will reach Pilcaniyeu and even be continued to Bariloche. North of Pilcaniyeu, most of the traffic goes to Neuquen, but as that is the nearest town of any importance on a railway having connection with Bahia Blanca and Buenos Aires, it furnishes most of the supplies needed in this entire region to the south.

Leaving Pilcaniyeu at 4:15, after a simple meal, we found many irregular spots in the road, due to the more frequent passage over it of many carts, and also to the difference in the soil, which was more earthy and consequently these heavy carts made deeper ruts, with a high and awkward hump between them. These humps in the middle of the road

caused many a delay and detour to avoid them, and progress was often slow on that account. About 5 we caught the first clear glimpse of the snow capped Cordillera, and shortly afterwards, the beautiful saddlelike peaks of mighty Tronador rose before us. During the afternoon, too, we had noticed a better and greener landscape, more cattle (horses chiefly), richer valleys to right and left of the highway, and more frequent dwellings than had been visible the day before. A well established civilization was coming into existence along the road. At 6:30 we entered the Rio Nirihuao (and here we remained for some time; but that is another story which had best be given by Senor Elordi if ever he seems inclined to tell his experiences), and at 11:30, over a splendid road which allowed us to travel, even in the slender illumination of the stars, at the rate of some 40 kilometers (25 miles) an hour, we entered the town of Bariloche, tired but victorious. We had made today just 50 leagues (156.34 miles).

In Bariloche we remained during the early hours of the day, partly to rest, partly to visit, and practically because nothing could be gained by attempting to hurry across Lago Nahuel Huapi, on which the town lies. The lake itself is beautiful, and deserved the hours we spent on it, as its shores are lined with pine-covered hills, and toward the west the snowy Cordillera is always in view. But the steamer (specially engaged for the occasion) was ready for us at 4 in the afternoon, and we then continued the trip to the farther end, arriving at the landing place of Puerto Blest at 9:30 that night.

Puerto Blest we left at 4 the next morning, traversing the short interval between Lago Nahuel Huapi and Lago Fria, only four kilometers (2.5 miles) over a slight wooden-railed tram, in 40 minutes. Lago Fria (not Frio, because the name does not indicate the temperature of the water, but that of its early investigator) is a deep pocket in the mountains, with precipitous sides, allowing admittance only at the two ends where the company has placed landing stages. We were rowed across it in a small boat, a distance of 10 kilometers (6.21 miles), leaving one end at 4:50 and arriving at the other at 5:30. We left the little lake at 5:50, on muleback to cross the divide between the lakes and on the way to leave Argentina and to enter Chile, for we passed the boundary line at 6:45, three kilometers (1.86 miles) from Fria. A distance of six kilometers more brought us to Casa Pangué, on the edge of the Rio Peulla, up whose valley a splendid view of Tronador is obtainable. Then a wagon ride of 17 kilometers (10.56 miles) through a forest of pine and other timber, following the Rio Peulla all the way, brought us to the hotel at Peulla on the shores of the Lago Esmeralda, where we arrived for breakfast.

Leaving Peulla at 2:30 in the afternoon we steamed across Lago Esmeralda, 50 kilometers (31.06 miles), coming closer at every turn to beautiful Mount Osorno, which raises its snow peaked cone above all the surrounding landscape, and landed at Petrohue at 4:30. Here horses were already waiting for us, and with only time for a cup of coffee we were away for Ensenada, 18 kilometers, at one

The Bolliche at Colorado, Where the Governor Had Deposited a Supply of Gasoline.

end of Lago Llanquihue, the largest lake in Chile and second only to Titicaca in South America. We arrived at 7:15, took supper in the hotel at Ensenada, and left by steamer at 9 for Puerto Varas, 50 kilometers across the lake and the nearest station on the Central Railway of Chile, arriving at 12:30 a. m. (Argentine time, but before midnight Chile time).

From Puerto Varas there is only an afternoon train running no farther than to Osorno, about 58 miles. Through connection with Santiago has been established for some time, but the line to Varas, being recently opened, is at present only for local traffic, and consequently the traveller must spend the night at Osorno, and we had to go to a hotel to wait for the through train in the morning. We left Osorno at 5:50, being lucky enough to find a sleeping car (dormitorio) to carry us all the way to Santiago.

Bariloche is a village in Argentina, from which cart roads with a simple commerce extend toward the north to San Martin de los Andes, toward the northeast to Neuquen, and toward the east to the present end of the railway coming westward from the Atlantic port of San Antonio. The completion of this railway will bring all this beautiful east Andean region into touch with the populous area of the republic. A railway is building to the west and north from Neuquen, its ultimate destination being into Chile. In the neighborhood of Bariloche, however, great industrial progress is expected, while it offers attractive possibilities for the farmer, the rancher, and the lumberman. It lies on Lake Nahuel Huapi at an elevation of 740 meters (2428 feet). The shores of this lake are thickly forested, and already some settlement has begun to make itself felt.

The narrow arm of Nahuel Huapi, up which the little steamer runs to reach the westernmost shelter, offers a wonderful stretch of scenery, comparable in many respects to a fjord of the Norway coast. In most places the sides fall sheer into the water from a height of hundreds of feet above. Old Indian remains are known to exist here, and it is a tradition that the Araucanians knew of the pass from the lake across the Cordillera. Certainly the waters of the lake offer the only highway,

because to get at the eastern shore in any other manner than through this arm demands a body and nerve racking detour through the wildness of pine forest that clothes those rocky eminences. Eternal snows cover the higher peaks of the inclosing mountains, while an occasional glimpse of Tronador—3600 meters (11,811 feet)—can be caught to the southwest.

Laguna Fria is so still and shadowful in its deep mountain basin that even talking seems a desecration, and the rhythmic dip of the oar is the only sound expected or tolerated. It lies 10 meters (32.8 feet) above Lake Nahuel Huapi, but its waters flow eastward, the watershed between the Atlantic and Pacific, and consequently the boundary between Argentina and Chile, being found at an altitude of 1050 meters (3445 feet), three kilometers west of Lake Fria. From this cumbre, as the pass over the divide is called, the descent is rapid to the bed of the Rio Peulla, only 320 meters (1050 feet) above the level of the sea. This river hurries on to the Pacific as if it bore the burden of all the snows of the Andes; its waters are therefore not navigable, but the good road along its shores, built through the woods, adds a change to travel. The snowy mountains are occasionally glimpsed through the trees, and at one place we passed not far from a pretty waterfall over the side of the cliff.

Lago Esmeralda receives the water from Rio Peulla. The lake itself is a considerable body of water. It differs noticeably from Nahuel Huapi, because the sides are usually less precipitous, while sandy shores and beaches are quite common. More settlement is discovered in the bays and sheltered spots. Great charm, however, is given it by the fact that two lofty cones of Puntlagudo and Osorno—called volcanoes in the Spanish, although there is little activity left in them—are now plainly visible. They present an interesting contrast, the one being, as its name implies, a sharp, toothlike projection into the blue sky, the other rising gently and very evenly from all sides into a smooth and well rounded summit. There is an agreeable hotel on its shores, and the traveller can have many worse experiences than to pass a few hours or days in it.

## SIMPLEX DEFEATS PEUGEOT.

### Louis Disbrow Takes 300-Mile Carnival Sweepstakes Event at Galveston.

The chief event at the beach meet, Galveston, Tex., July 28-30, was the 300-mile carnival sweepstakes, run in three divisions, 100 miles each day. At the end of the first section Louis Disbrow in the Simplex Zip was ahead, his time for the distance being 1:23:59.48. Chandler in a Mason was second and W. Endicott in a Case third. After running the second division Ferguson in a Peugeot had lowered Disbrow's time of the previous day, covering the 100 miles in 1:23:57.3. At that time Disbrow was in second place and LeCain in a Stutz third. It began to look as if the French car would take the event, particularly as at one time on this second day it practically was a whole lap ahead of the Simplex. However, on the third day, all but four of the original 15 entrants failed to finish. The results for the three days follow:

| Carnival Sweepstakes. |                   |            |

**Stutz Wins Santa Monica**—A special dispatch from Santa Monica, Cal., states that the fifth annual Santa Monica road race, Aug. 9, was won by Earl Cooper in a Stutz, his time for the 445 miles being 6:01:52. Barney Oldfield in a Mercer was second, in 6:07:45, and Louis Nikrent in a second Mercer, third, in 6:28:17.2. Fourteen cars started, and five were eliminated before the close.

## INDIANA MAKERS COMPLETE TOUR.

**I**NDIANA money was no good in California upon the arrival in that state of the members of the Indiana Automobile Manufacturers' Association on their transcontinental tour. As soon as they crossed the border they were taken in charge by a committee representing the chambers of commerce in the principal cities of the state, and during the journey from Lake Tahoe to San Francisco, the stay in the latter city, and the trip down the coast to Los Angeles, rooms, beds and meals were provided. The reception accorded the Hoosiers in the Golden State was a fitting climax to one of the most interesting and important automobile tours yet held.

As stated in the last issue, the stay in Salt Lake City was cut from two days to one, on ac-

a misunderstanding of the routing directions, a circumstance which can readily be understood by those who have crossed the Nevada desert, the party was sent over Dugway pass, a grade that no car had attempted during the past three years. It was a long, steep grade, averaging 18 per cent., and many of the cars found this by far the most difficult portion of the journey, the heat and the sand in nowise contributing to the easy accomplishment of the task. Once over the pass the tour entered an alkali plain for the remainder of the distance into Kearney's, where the tents were pitched in the rain.

Half-way between Kearney's and Ely (125 more miles of desert) the Premier truck, carrying a supply of United States tires, which had

**Members of the Indiana Automobile Manufacturers' Association on Indiana-Pacific Tour Received by Gov. Spray of Utah at Spanish Forks, Utah.**

count of the delay caused by the cloudburst near Thompsons, Utah. Consequently, the side trip to Ogden was omitted. After bathing at Salt Air beach, hearing a grand organ recital in the Mormon tabernacle and enjoying a banquet, at which good roads and the proposed Lincoln highway were discussed once more, the tourists left for Kearney's ranch, Nev.

Some desert had been encountered before Salt Lake City was reached, but that was as nothing compared with the dreary waste of sand some 172 miles wide before reaching the oasis at Kearney's. Harlow Hyde, advertising manager for the Empire Automobile Company, in the Empire 19, which acted as pacemaker that day, declared these roads to be the worst in the universe. In this opinion there was little disagreement on the part of the other tourists. Unfortunately, due to

stopped to aid a local car, suffered its first accident. The men in charge were forced to wait for assistance, and when night came rolled themselves up in blankets and climbed behind the grated doors on top of the tires. Sleep proved impossible because of the cries of the coyotes. It was not until the next evening, 18 hours after they became stalled, that help arrived. After a hurried trip to Ely and back to the truck, when repairs were made quickly, the crew set out to overtake the remainder of the party in Lake Tahoe, Cal., nearly 400 miles distant, 48 hours later.

From Ely, the tourists went to Goldfield, by way of Tonapah, 211 miles, which was covered in approximately 12 hours. At Hot Springs ranch, near Tonapah, Gov. Ordde of Nevada greeted the tourists and made a short address at the luncheon tendered the visitors. Forty

**The Kerosene Henderson Leading the Hoosier Caravan Through the Desert Lands in Nevada.**

miles east of Tonapah, the Pathfinder met with difficulty, and the driver was forced to spend 14 hours before the arrival of the relief car. However, he had succeeded in making the necessary repairs by this time, and elected to reach Lake Tahoe by way of the Fallon sink and Reno. Heavy rains had destroyed portions of the roads and in places it was necessary to drive on the railroad ties. The Pathfinder rejoined the others at Lake Tahoe on time.

The big redwood forest between Goldfield and Casa Diablo, where the next night stop was made after visiting Bishop, Cal., offered a pleasing relief over the days spent in the alkali deserts. Fifty miles out of Goldfield the state line was crossed, the site being marked by a flagpole bearing the United States and California flags. Here the party was met by a delegation from the Inyo Good Roads Club of Bishop and escorted over the White mountain pass through narrow canyons where the road lay in the dry bed of a creek, to the top of Westgard pass with its 10 per cent. grade, then down through rocky gorges, but over one of the finest roadbeds of the entire trip, the route of the pony express from the eastward in the old days.

Upon leaving Bishop good roads were traversed for 25 miles in the valley, until another mountain pass was reached.

Next came a government reserve in the pine forests and more canyon roads, until camp was pitched at Casa Diablo. Here supper consisted of a large portion of some 500 trout caught by five men, who explained that it had been a bad day for fishing. Casa Diablo signifies "The Devil's Castle," and is so named because of the presence of a boiling hot geyser, around which sulphur smoke escapes from the rocks.

Soon after leaving camp the next morning the summit of the Sierras was passed, and then came a gradual descent into Carson City, Nev., through a succession of mountain passes and

fertile valleys. During the day the tourists passed Mona lake, a body of water one-fourth solid, so saline that no vegetation appears on its shores.

From Carson City to Lake Tahoe, back over the California line, the tourists were required to make a 12-mile climb up King's canyon to an altitude of nearly 8000 feet. This brought them to Glen Brook, from which point a ferry conveyed them across the lake to Tahoe tavern. Here the Hoosiers were met by the California reception committee, and the remainder of the journey into San Francisco was a grand triumphal procession. Another big banquet was held at Lake Tahoe.

July 26 the cars were again ferried across the

**Hoosier Tourists in Camp at Kearney's Ranch, Nev., After Crossing Dugway Pass and 172 Miles of Alkali.**

**Elwood Haynes, Pioneer American Gasoline Automobile Inventor, and Gov. Ammons of Colorado, at Denver.**

lake, from which point they climbed over High Summit, at an altitude of 7400 feet, and began the long descent to the coast. At Sacramento, the night stop after 140 miles, Gov. William Johnson of California gave a public reception to the tourists.

The Pacific was reached at Oakland about 5 Sunday afternoon. Thousands of motorists from Oakland and San Francisco met the tourists and a large escort from Sacramento, on the way, and this portion of the long journey was ended amid holiday scenes. The contrast between this grand parade and the struggles in the alkali desert earlier in the week, to say nothing of the difficult passes over the Continental Divide, seemed a fitting celebration of a victorious band of motorists which had conquered roads never before attempted in a transcontinental tour of this kind.

In connection with the arrival in San Francisco July 28 was the appearance of a 1914 Cole, an engineering test car from the factory of the Cole Motor Car Company, Indianapolis, at the reception tendered the Hoosiers, Monday evening. The Cole company had decided not to take part in the tour, because of its inability to secure a machine on time for the start, July 1. The test car was placed in charge of Chief Engineer Charles S. Crawford the morning of July 12, and he left immediately for Chicago. The route westward was across Illinois, Iowa, Nebraska and Wyoming into Salt Lake City, where it picked up the route

taken by the others. It was delayed a half day in Chicago and a whole day in the desert country. Rain was experienced each day after leaving Omaha, with the exception of the last.

The tourists were a day late getting out of San Francisco, on the last leg of the journey into Los Angeles, leaving Friday, July 31, instead of Thursday, as originally planned. The trip down the Pacific Coast was without special incident, except for the popular reception in each city and town. The tour ended, after 3766 miles, at 5:30 Sunday afternoon, Aug. 3, when the party was escorted into Los Angeles by hundreds of California motorists.

The results of the trip will be awaited with interest. Throughout the entire distance the Haynes entrants, in charge of Elwood Haynes, pioneer gasoline automobile inventor in America, were examined with special care. Mr. Haynes became a decided hero in the Far West, and was kept extremely busy reciting his early experiences, back in 1893, when he was trying his best to get a gasoline motor to propel his first crude vehicle. Ray Harroun and his Henderson 3, with its kerosene carburetor, also claimed their full share of interest, after crossing the great American desert at the head of the column without mishap. The Empire, the smallest car in the tour, carried Indianapolis air into Los Angeles in three of its tires. Unfortunately, information is not yet at hand to indicate the manner in which the individual cars withstood the long journey, and that must be made the basis of another story. The return to Indianapolis will be made by train at the convenience of the tourists.

## GENERAL NEWS OF THE INDUSTRY.

### Harry Fosdick Re-Enters New England Field with Hupmobile--Handley Forms Selling Company--Matheson Goes with Palmer-Singer--Other Changes.

**H**ARRY Fosdick and Frank F. Wentworth, two of the best known men in the industry in New England, have organized a company, with headquarters at 926-928 Commonwealth avenue, Boston, to take over the distribution of Hupmobile cars, made by the Hupp Motor Car Company, Detroit, in New England. Mr. Fosdick recently retired from the Hupmobile factory organization for this purpose, and his association with Mr. Wentworth is expected to increase the sale of this make of car very materially.

Mr. Fosdick is without doubt one of the best informed men concerning the history of the motor car in America. He began his connection

**Harry Fosdick, Pioneer Automobile Salesman.**

with the industry in 1899, when he became associated with the first retail automobile salesroom in the country in Boston. He is best remembered as having introduced the Mobile in that city. Later he established the Boston branch of the Winton, and after serving a number of years as its manager he organized the Harry Fosdick Company, which was interested in a number of foreign importations. He disposed of his stock in this concern to become identified with the Hol-Tan Company of New York City, of which he was vice president, handling the American sales of the Fiat. He also was associated with Vincenzo Lancia in introducing the Lancia car in this country. Some few years ago he became sales manager of the Stevens-Duryea Company, Chicopee Falls, Mass., and left that concern to become sales director for the Hupp Motor Car Company.

with the industry in 1899, when he became associated with the first retail automobile salesroom in the country in Boston. He is best remembered as having introduced the Mobile in that city. Later he established the Boston branch of the Winton, and after serving a number of years as its manager he organized the Harry Fosdick Company, which was interested in a number of foreign importations. He disposed of his stock in this concern to become identified with the Hol-Tan Company of New York City, of which he was vice president, handling the American sales of the Fiat. He also was associated with Vincenzo Lancia in introducing the Lancia car in this country. Some few years ago he became sales manager of the Stevens-Duryea Company, Chicopee Falls, Mass., and left that concern to become sales director for the Hupp Motor Car Company.

Mr. Wentworth is quite as well known throughout New England, having interests other than in the automobile field. He did much toward popularizing the Overland car in this district, and also was decidedly interested in the sale of American, Marion and other cars.

### PURCHASES CINCINNATI CONCERN.

#### Rock Island Battery Added to Line Made by Manhattan Electrical Supply Company.

The Manhattan Electrical Supply Company, 17 Park place, New York City, has purchased the business and plant of the Rock Island Battery Company of Cincinnati, O., and took possession Aug. 1.

This important move does not mean that the Rock Island brand of dry battery will be discontinued, for it is the intention of the Manhattan company to make it in connection with Red Seal, Hi-Up, Blue Seal and Mesco batteries, now made at the other factories of the New York concern.

### CONTINENTAL BUYS MACHINERY.

#### Took Advantage of Good Business Opportunity Offered by Lozier Motor Company.

As the result of a recent purchase of machinery for the Detroit plant of the Continental Motor Manufacturing Company, maker of Continental motors, a story has been circulated that the Continental company has acquired the Lozier Motor Company's motor making plant. The latter concern has designed and built its own motors since Lozier cars were first built 10 years ago, and will continue to build them in future, according to N. R. Feltes, treasurer of the company.

In explaining the report, George W. Yeoman of the Continental company says: "It is only fair to the Lozier company to kill this rumor before it has had time to spread. What really happened was this: Our Detroit plant was flooded with orders and we were trying to procure some new motor machinery quickly. In this dilemma we were offered a part of the new equipment in the Lozier plant for immediate delivery and instantly purchased it."

**TO SUPERVISE EMPIRE SALES.****Wallace C. Hood Leaves Westcott Company for Indianapolis Concern.**

Wallace C. Hood, formerly general manager of the Westcott Motor Car Company, Richmond, Ind., has been appointed commercial manager of the Empire Automobile Company, Indianapolis, Ind., maker of Empire cars.

Wallace C. Hood, Commercial Manager, Empire Automobile Company.

The constantly increasing volume of business done by the company has made necessary many additions to the organization of that concern, Mr. Hood's being one of the most important to be made recently and one which will please his many friends.

He will supervise the sales and advertising policies of the company and in the triangle composed of Cecil E. Gibson, general manager, and L. R. Wilbur, his assistant, should develop some very profitable sales policies for Empire distributors throughout the world. Mr. Hood is a man of keen ability in the forming and execution of sales policies. He was at one time sales manager of the Chalmers Motor Car Company, and later of the Metzger Motor Car Company, both of Detroit, and is one of the best known automobile men in the country.

**REMOVED TO FRAMINGHAM.****Standard Woven Fabric Company Finds Worcester Plant Inadequate for Its Needs.**

To meet the decided increase in the demand for Multibestos brake lining, standard woven belting and solid multiple hose fabrics, the Standard Woven Fabric Company, which for many years has been located at Worcester, Mass., has occupied its new factory recently built and equipped at Framingham, Mass.

This step was made necessary because the facilities at Worcester had become inadequate to meet the growth and expansion of the business. In the new factory at Framingham is incorporated every modern feature tending to promote quality and economy of production, not only in the company's present line, but additional products which embrace everything in the way of woven fabrics for mechanical purposes.

**BECOMES GENERAL MANAGER.****Clarence H. Booth Assumes Position of Highest Responsibility with Studebaker Concern.**

In the appointment of Clarence H. Booth as general manager of the automobile division of the Studebaker Corporation, Detroit, maker of Studebaker machines, the directors of that company have clearly recognized merit, as it is generally conceded that the promotion was well deserved. Mr. Booth has been closely identified with the expansion of the Studebaker automobile business since its development began.

When the E-M-F Company was making decided advances in the automobile field, Mr. Booth was operating a large independent steel stamping mill at Detroit, known as the Pressed Steel Sanitary Manufacturing Company. The automobile concern needed such a factory for the manufacture of fenders, hoods and other parts, but lacked the time to build a new plant. As a result Mr. Booth's factory became a part of the fast growing Studebaker business.

Mr. Booth retained charge of his old factory and in a short time he was given Studebaker

Clarence H. Booth, General Manager, Studebaker Corporation.

plant No. 3 in addition, with 2500 employees in his charge. He demonstrated his capacity and soon became manufacturing manager of the entire automobile division. Within a year he be-

came assistant general manager and it is from this position that he has taken the position of highest responsibility, that of general manager of the entire automobile business. Within four years the men under his direct charge have increased in number from 1000 to 10,500.

### FORMS SELLING COMPANY.

#### J. I. Handley Combines American and Marion Interests in \$1,000,000 Concern.

From Indianapolis comes the announcement of the formation of a new \$1,000,000 concern, to be known as the J. I. Handley Company, which will own all of the Handley interests in the Amer-

J. I. Handley, President, J. I. Handley Company.

ican Motors Company, the Marion Motor Car Company, the American Motors Realty Company, the A. & M. Sales & Service Company, all of Indianapolis; the American-Marion Sales Company of New York and the American Motors California Company of San Francisco. The

new company is to be the sole

selling agent of the American Motors Company and the Marion Motor Car Company, marketing all American underslung and Marion models.

President J. I. Handley states that this move is to accomplish two purposes: First, it will unify all of his interests in these companies, and second, it will departmentalize more specifically the work of the various units. "With the sales, advertising and service work entirely removed from the manufacturing companies and thrown into another individual company, whose function will be the distribution of the product of both the American and the Marion companies," says Mr. Handley, "we will be able to pursue a more concrete manufacturing programme. In other words, the American Motors Company will have nothing to do but build the famous American underslung models. Similarly the Marion Motor Car

Company will concentrate entirely upon the production of the Marion sixes and fours. Thus the new company will be able to specialize and concentrate all its efforts in successfully distributing and promoting both products."

V. A. Longaker, in addition to continuing as chairman and general manager of the American Motors Company, will also, at the request of President Handley, accept the vice presidency of the new corporation. D. S. Menasco, vice president of the American Motors Company, will continue in this capacity, but will also become president and general manager of the American Motors California Company, with headquarters at San Francisco. J. I. Handley will retain the presidency of both the American and Marion companies.

### MATHESON WITH PALMER-SINGER.

#### Becomes Western Manager in Territory Between Pittsburg and Pacific Coast.

C. W. Matheson, for eight years chief executive of the Matheson Automobile Company, Wilkesbarre, Penn., maker of Matheson cars, has formed an association with the Palmer & Singer Manufacturing Company, New York City, manufacturer of the Palmer-Singer automobiles. Mr. Matheson will be western manager, in charge of the business of the company in the territory between Pittsburg, Penn., and the Pacific Coast.

Mr. Matheson is one of the best known men in the automobile industry, and has long been identified with the manufacturing end. The Palmer & Singer Manufacturing Company recently doubled its factory output and is preparing to double it again within the next 12 months. Consequently the company is now, for the first time, in a position to develop the western territory, which perforce was neglected in the past. That Mr. Matheson is the right man to undertake this task of opening up a virgin territory for the company is attested by his reputation as a business man of exceptional ability.

### TO REOPEN FLANDERS PLANTS.

#### Pelletier Said to Have Organized Tiffany Electric Car Company for This Purpose.

It is announced that E. LeRoy Pelletier, advertising manager and publicity promoter, was the central figure in the purchase of the remaining assets of the Flanders Manufacturing Company, Pontiac, Mich. The plans of the pur-

chasers are said to contemplate a revival of the Flanders electric car as previously produced, but it will be known as the Tiffany Mignon, the firm name also being changed to that of the Tiffany Electric Car Company. In addition there will be a larger and more expensive car produced, which will be styled the Tiffany De Luxe.

Among those said to be associated with Mr. Pelletier in the acquisition of the Flanders concern are Dr. James B. Book, who has been associated with him in previous ventures, including the original E-M-F company, and Don C. McCord, who has been prominent in the Flanders company since its inception and who, it is said, will resume his former position of general manager.

The company has remained practically at a standstill since December, 1912, awaiting business readjustments. The plants at Chelsea and Pontiac, Mich., were operated on a small scale until they were purchased by Harris Bros. & Co. It is said that the new enterprise will not interfere with Mr. Pelletier's connection with the Maxwell Motor Company.

#### ESTABLISHES SERVICE BRANCHES.

#### Apple Electric Company Places Aplco Device Within Reach of All Users.

The Apple Electric Company, Dayton, O., maker of electric motor starters for motor cars and motor boats, as well as electric lighting equipment, announces it has completed arrangements whereby service and installation stations for Aplco devices will be opened immediately in the principal cities. In view of the fact that it has been a problem among manufacturers of electrical equipment to provide users adequate installation and subsequent care service, this announcement marks a signal advance step in the campaign of the Apple company to secure the reward for its efforts in the electrical field.

This arrangement gives to the purchasers of Aplco motor starters and electric lighting systems the benefit of the most thoroughly trained and experienced organizations and insures prompt and efficient attention, not only on the installation of new work, but upon the care of that already installed. The various branches will also carry stocks of Aplco devices and will act as distributing stations for these products, both retail and wholesale, except that the negotiations between the Apple company and automobile manufacturers will be conducted through special representatives from the factory.

Stations are already located in each of the following cities: Newark, N. J.; New York City, Philadelphia, Penn.; Boston, Mass.; Atlanta, Ga.; Chicago, Kansas City, Mo.; Los Angeles, Cal.; Seattle, Wash.; San Francisco, Cal.; London, England; Buenos Aires, Argentine. Others will be established in the near future.

#### WINS DESERVED PROMOTION.

#### George H. Kelly to Direct Sales of All Classes of Baker Electrics.

At a recent directors' meeting of the Baker Motor Vehicle Company, Cleveland, O., maker of Baker electric pleasure and commercial vehicles, George H. Kelly, formerly manager of the truck department of the concern, was advanced to the office of secretary and sales director. R. C. Norton, heretofore secretary and treasurer, will continue as treasurer. E. J. Bartlett becomes sales manager of the truck department and O. B. Henderson continues as sales manager of the pleasure car department.

The election of Mr. Kelly follows his success in developing the truck sales of the Baker company. Established scarcely two years ago, this department has the enviable record of placing machines not only in each section of the United States, but in cities in Europe, Africa, Japan, South America and Alaska. In giving Mr. Kelly the additional office of sales director it has been the purpose of the Baker company to correlate the sales policies of its pleasure car and transport departments under one managing head, so that in their co-operative work with dealers the two divisions may be brought closer together and go forward on a mutually strengthened basis. His many friends throughout the industry will see in this a satisfactory recognition of his merit.

George H. Kelly, Secretary, Baker Motor Vehicle Company.

# NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

## Electrene Fire Gun.

The Western Electric Company, 17 Battery Place, New York City, and with branches in numerous cities, is manufacturing the Electrene fire gun, a fire extinguishing device which is constructed in three styles. That designed especially for service with the motor car, garage, motor boat, etc., is the lightest and of one quart capacity. Lightness and ease of operation are emphasized with the Electrene, and to use it the nozzle is turned and the stream directed at the base of the blaze. It is stated that the stream can be directed accurately by one hand, and that one person can operate two extinguishers at once. The fluid is forced out in a fine spray by compressed air and it is maintained that its efficiency is not impaired by age, heat or cold, and that it will not conduct electricity. Although the fluid will extinguish burning oils, gasoline, etc., it is claimed that it will not injure the most delicate of fabrics nor leave any trace of its presence. The container is sturdily constructed, but light. The company also manufactures sizes adapted to shops, etc.

## Newcomb Carburetor.

The Newcomb carburetor is manufactured by the Holtzer-Cabot Electric Company, Chicago and Boston, and attracted attention in motoring circles by its performance in the recent fuel economy test of a Franklin car when the machine travelled 83.5 miles to a gallon of gasoline. The Newcomb is of the float feed type, having a metering mechanism, which measures the quantities of fuel and air in service. The carburetor operates on a constant vacuum and automatically enlarges the effective air and fuel openings in proportion to each other and to the demand of the motor. The metering mechanism is located in the vaporizing chamber, comprising a hollow plunger surrounding a pipe at the top of which the fuel nozzle is located. A fuel controlling needle is fixed to the upper part of the plunger, near the bottom edge of which are a number of small holes, these distributing the fuel after it has issued from the main fuel measuring orifice. These holes are arranged to register with an equal number of narrow air slots cut in the plunger tube chamber. The plunger is seated on a regulating collar, the function of which is to withdraw the fuel needle from its closed position by raising the plunger without uncovering the air slots. Normally, the fuel nozzle is nearly closed, thus the opening of the fuel port is given a lead with respect to the air ports, slightly enriching the mixture for slow operation. When air is drawn through the carburetor the plunger lifts in proportion and the needle in the nozzle raises at the same time, supplying the fuel required to provide a correct mixture. The higher the plunger is lifted the larger the air and fuel openings. The effective areas of the air and

fuel ports are so proportioned that it is held that the mixture is correct for every air flow. A homogeneous and dry mixture is claimed for the Newcomb, one making for economy of fuel and the elimination of deposits in the cylinder or smoke in the exhaust. A starting device is incorporated. The vaporizer is also water jacketed.

## J-M Mobilite Electric Lamp.

The J-M Mobilite electric lamp is marketed by the H. W. Johns-Manville Company, New York City, and comprises a vulcanized rubber socket fitted to a powerful lens and reflector. The bulb utilized is a special tungsten and it is stated that the light is unusually brilliant. The lamps are made in three styles, the No. 1 being designed for mounting in the dash, while the No. 2 is an automobile type and a rear signal, it having the conventional red semaphore and white light for the license plate. The third design is the dash. A complete equipment of these lamps consists of two set-in, one dash and a tail member. The last named has an ingenious key switch, conforming to the laws of all states requiring that the light be controlled from the rear. Bulbs cannot be stolen from the lamps. It is claimed that the lights are inexpensive to operate; that six No. 6 J-M batteries will operate four lights for 80 to 120 hours, while six No. 8 cells will supply current for 420 hours.

## Herz Bougie Mercedes Spark Plug.

Herz & Co., 295 Lafayette street, New York City, is manufacturing the Herz Bougie Mercedes spark plug, which has as one of its several features a double blue enamel stone, a construction which it is claimed makes it unbreakable and decidedly efficient. The balance of the components are sturdy and the electrodes are constructed of a material which eliminates burning and sooting. The plug is liberally guaranteed. The company also manufactures the Herz magneto.

## Entorf's Water Separating Filter.

Entorf's water separating filter is manufactured by the Entorf Filter Company, Amboy, Ill., and is designed for service with gasoline, kerosene and other similar oils. It resembles a common funnel, but near the top is a fine screen, which retains the oil, thus forming a film and preventing the passage of any water in the fluid. Above the screen is an opening into a drain duct or vent on the outside of the funnel, which the water can enter. Below the first screen is a second member, and another opens into the drain duct. A mechanical device is incorporated at the bottom of the filter, so arranged that the oil will pass through into the spout, while the heavier substance will flow to a reservoir and be discharged outside.

## Apco Ford Socket Wrenches.

The Auto Parts Company, Providence, R. I., manufacturer of Ford accessories, is marketing two types of

Norisko Lock

Hoyt Pocket Voltmeter

Burn-Boston Battery

J-M Shock Absorber

Narco Tire Cut Filler

Bowers Carburetor

Mohawk Non-Skid Tire

all steel socket wrenches designed for displacing and replacing the cylinder head bolts of model T Ford motors. As these bolts must be set up snugly to prevent loss of compression, an ordinary tool presents difficulties. The wrench is off-set and it is a simple matter to reach the bolts and to exert considerable leverage through the length of the handle. The socket wrenches are made in two styles, with single and double ends, and the tools may be utilized for a number of purposes. They are moderately priced and guaranteed.

#### Knutson Motor Starter.

The Automatic Devices Company, Galesburg, Ill., is manufacturing the Knutson motor starter, which is of the mechanical type and fitted to the extension of the crankshaft, replacing the usual starting handle. A pressure of the foot on a pedal conveniently located releases a spring, which unwinds slowly at first to prevent sudden stresses. This action is controlled by a brake band and a positive lock. Upon the crankshaft rotating the speed is automatically increased. The spring is re-wound by the rotation of the crankshaft. It is held that the device is mechanically perfect, has few parts, is simple in its operation and that it can be easily attached to any type of gasoline vehicle.

#### Norisko Wheel and Ignition Lock.

The Norisko steering gear and ignition lock is marketed by the C. J. Rogers Manufacturing Company, Abbott building, Philadelphia. It comprises a sturdy shackle permanently secured to the steering post by a unique screw arrangement. It is claimed that the lock cannot be tampered with short of drilling. Within the shackle is a plunger which, when pushed in part way by the thumb, breaks the ignition circuit. A further movement engages the plunger with a slot in the steering post proper, locking the gear after the wheels have been turned at an acute angle. This prevents the car being operated or towed. The Norisko locks automatically and is provided with a Corbin lock and key. The device is nickel plated.

#### Narco Tire Cut Filler.

Narco tire cut filler is the product of the National Rubber Company, St. Louis, Mo., and comes in a compressible tube having a convenient nozzle. The contents of the tube are a special preparation which it is stated will weld itself to the walls of a cut in a casing, becoming integral with the rubber and providing a union so perfect that no road abuse will remove it. The Waite Auto Supply Company, Providence, R. I., is Rhode Island distributor.

#### Burn-Boston Battery.

The Burn-Boston battery, made by the Burn-Boston Battery Company, 19 Doane street, Boston, differs from the conventional dry cell in that a liquid is utilized for an electrolyte. It is square shaped, occupies relatively the same space as a dry cell, and is not affected by heat, cold or moisture. The cell is securely sealed and it is claimed that it will not deteriorate when out of service

for a considerable period. The connections are unusually durable, not being affected by vibration, and the zinc terminal comprises a special wire. The leading features of the Burn-Boston are its long life and efficiency. The voltage is standard.

#### Bowers Carburetor.

The Bowers model G carburetor is marketed by the Gilbert Manufacturing Company, New Haven, Conn., and is simply constructed in that there is but one adjustment to be made, that controlling the fuel. Variable climatic changes are compensated for in the Bowers by the use of an annular brass disc surrounding the central or fixed air inlet, which consists of a venturi shaped tube. The disc contains a plurality of three or more correctly proportioned air ports which admit an additional supply of air and which are controlled progressively to the requirements of the motor by variable tensioned phosphor bronze reeds. These are held to be self-cleaning and not to alter in tension. The adjustment of the Bowers is by a conveniently located needle valve. It is made in standard sizes, is moderately priced, and economy of fuel as well as maximum motor efficiency are emphasized with the construction.

#### Hoyt Pocket Voltmeter.

The storage battery, utilized for lighting or ignition, requires proper care and the cells should be tested from time to time to note their condition. The Hoyt Electrical Instrument Works, Penacook, N. H., maker of current indicating devices, is marketing a voltmeter of the pocket type which is guaranteed to be accurate and which is of the coil type. The new meter, which comes in a sturdy case, averages about 40 ohms a volt, is dead beat in action, slightly larger than a watch and is moderately priced. Being designed particularly for service with storage batteries it forms a valuable addition to the owner's equipment.

#### J. M. Shock Absorber.

The J. M. Shock absorber, marketed by the J. M. Shock Absorber Company, Inc., 210 South 17th street, Philadelphia, is the invention of Jacquet Maurel, a French mechanical engineer, who claims to have solved the problem of applying a helical spring principle to the laminated spring of the motor car. Except on a car having a full elliptic spring, the car spring is attached at its end by a shackle to allow for elongation of the laminated member. In the J. M. this shackle is replaced by its equivalent, a bronze head, which acts as a guide for the helical bolts of the absorber and a bearing for the hanger bolt. Attached to the bronze head is a tube in which is confined the helical spring. This tube allows the spring to be compressed along a true plane at right angles to the car spring, thus obtaining its maximum efficiency. The tubes and springs are of four different diameters, which permit of attachment of the J. M. to any size of machine. The J. M. is designed to increase the efficiency of the regular spring, operate as effectually over smooth as rough

roads, and save the tires and components of the vehicle from vibration and shocks. It is made in single and twin types, for any make of car, also a Ford special, and is guaranteed.

#### Nospill Funnel.

The F. L. Hoaglin Manufacturing Company, Waupaca, Wis., is producing the Nospill funnel, so termed because it eliminates overflowing of the gasoline or liquid used. In addition there is a device which shows the rise of the liquid and means are provided for stopping its passage to the container. When the fuel attains a desired height this is denoted by the central indicator, and further flow is instantly stopped by lifting the funnel ring, which closes a spherical brass valve in the lower portion of the discharge tube. The funnel is of enamelled lead covered steel and polished brass, is of five gallons capacity and a filter is incorporated.

#### Stafford Combination Tail Light.

The Stafford combination tail lamp and illuminated number is produced by the Stafford Manufacturing Company, 1475 Michigan avenue, Chicago, and was designed to meet requirements of various state laws for rear numbers that can be read as well in the night as in daylight. The lamp includes the usual red semaphore, but the illumination of the numbers is by another electric light within the casing, causing the figures and letters to stand out so as to be perfectly legible at a greater distance

starting the machine the rope and pulley arrangement pulls the vehicle as far as the stake.

#### Standard Ford Trunk Rack.

The Connecticut Steel & Wire Company, Hartford, Conn., is manufacturing a high grade trunk rack especially designed for model T Ford cars. It is made of the best .875 by .1875-inch flat steel with hangers one by .25 inch and the finish is black enamel baked on. The rack is secured to the car by means of four sturdy bolts and is braced in such manner as to be sufficiently strong to support any weight in proportion to the size of the car. It is moderately priced.

#### Mohawk Non-Skid Tire.

The Mohawk non-skid tread tire is the product of the Mohawk Rubber Company, Akron, O., and it is claimed that maximum traction is afforded by the suction cups in the centre of the tread, also that the heavy broad ribs take the wear and prevent side slip. It is stated that the best of Sea Island cotton and Para gum are utilized in the construction and that the workmanship is first class in every respect. The New York City branch of the company is at 1864 Broadway.

#### Presto Ford Cigar Lighter.

The Metal Specialties Manufacturing Company, 738 West Monroe street, Chicago, is marketing the Presto Ford cigar lighter, which is designed especially for the model T Ford cars, and current is taken from the mag-

than is required by law. All lamps are fitted with an Edison base socket of the latest type and the device is constructed of the best of material. It is finished in black with nickel listed as slightly extra. The Stafford lamp is moderately priced. The company also manufactures a lamp with a top reflector, having an adjustable bracket and adapted to retain any state license plate.

#### Dover Radiator Filler.

The Dover Stamping & Manufacturing Company, Cambridge, Mass., is producing a handy article for the garage in the nature of a radiator filler. It is a six-quart container and in addition to a serviceable handle, has a hooded spout, which permits of replenishing the supply of the radiator without the usual spilling. It is constructed of heavy galvanized steel and a brass strainer is provided, preventing the entrance of foreign elements into the cooler. The Dover radiator filler is moderately priced.

#### Pillsbury Auto Pull.

The Pillsbury Auto Pull is manufactured by the Pillsbury Sales Company, Minneapolis, Minn., and is a device for fitting over the rear hub cap of the wheel of the motor car to enable extricating the machine from deep sand, etc., which would ordinarily slip the wheels. The device comprises a pulley to which is attached a long rope having a hook at one end. The hook is attached to a stake in the ground, some distance from the car, and upon

neto of the machine. It is constructed to withstand the voltages developed by the flywheel generator, and the electricity heats a platinum wire contained in the lighter, enabling the lighting of a cigar. The device comes with 10 feet of silken cord and can be easily installed by attaching one of the leads to the magneto terminal and the second to metal or ground. By pressing a button in the top of the handle of the lighter, the circuit is closed, heating the platinum. All metal parts of the device are thoroughly insulated and the instrument is not only handy, permitting as it does lighting a cigar in a gale of wind, but it makes for safety. It is moderately priced.

#### Buckeye Ford Shock Absorbers.

The Central Brass & Fixture Company, Springfield, O., announces a new set of shock absorbers designed for Ford automobiles. There are three in a set, one being utilized in the front and two at the rear of the machine. The principle of the Buckeye absorber is the absorption of the recoil of the spring, it being accomplished by a spring coil and strap arrangement. The springs are fully oiled and tempered and the absorber fitted to the front of the chassis is secured by a clip device, easily attached and locked. The rear members are attached as readily. It is claimed that the Buckeye will prevent excessive compression as well as undue recoil of the springs. The set is inexpensive and may be fitted by the most inexperienced.

## NEW YORK'S MOUNTAINS AND LAKES.

### A Visit to the Adirondacks Region by Way of the Catskills and the Thousand Islands, and Return Through the Berkshires and Croton Lake District.

A TOUR that combines much of interest and splendid scenery is that presented herewith as No. 31. It is outlined to occupy six days, starting from and returning to New York City, and while some of the daily mileages are large the tourist undoubtedly will be able to readjust the night stops to accommodate his fancy and the length of time it is desired to remain away from home.

The first day's route runs along the Hudson on the east shore until after passing Poughkeepsie and soon after reaching Kingston turns into the Catskills for the night stop at Highmount. The Catskills are famed throughout the world for their beauty as well as the scene of Washington Irving's tale of Rip Van Winkle, and it is presumed that the tourist will find a single night hardly sufficient to explore their resources.

The Grand Gorge is reached early on the second day, after which the way leads into James Fenimore Cooper's country, turning north through Richfield Springs and Utica. The last named city is pleasantly situated in one of the most beautiful sections of the Mohawk valley and has a number of fine automobile roads. A particularly interesting view is to be obtained from the summit in Roscoe Conklin park. Seven miles west is the Revolutionary battlefield of Oriskany. A little to the east is the splendid Masonic home, which cost more than \$1,000,000.

The way from Rome to Watertown is over a state road with several stretches of macadam in Turin, and thence along the Black river valley. The third night stop is at Alexandria Bay. If possible the tourist should arrange to remain over here at least one whole day, as there is so much of interest to be seen that it cannot well be covered even in a much longer time. A steamer ride among the Thousand Islands in the St. Lawrence river gives some idea of the distinctive beauties of the region, but subsequent trips to other islands will indicate that each has features which are possessed by

none of the others, giving it a charm peculiar to itself.

Ogdensburg is a pretty little city at the confluence of the Oswegatchie and the St. Lawrence, the former of which affords abundant power for various manufacturing establishments. It is known as the Maple City, because of the magnificent maple trees which line its principal streets. Between Ogdensburg and Massena the tourist has opportunity to view the rapids of the St. Lawrence. The Gallops are a little less turbulent than the Rapids du Plats, but are almost as interesting. At the latter the dark

the distant ones being veiled in an exquisite violet hue. Rivers winding in and out among the green forests look like ribbons of silver, while amidst it all lies the peaceful Lake Placid, and separated from it by only a wooded eminence is Mirror lake.

Rich lake views, with occasional glimpses of Lake Champlain, are to be found on the way to Elizabethtown. Below Port Henry, at Crown Point, are the ruins of the old French Fort Frederick, the ramparts of which are brilliant with red thorn apples, in their season, a tree which is found nowhere else in the state and which

In the Midst of the Beautiful Lake Country of the Adirondacks.

swirling waters make a beautiful sight as they dash and tumble over each other in their haste.

From Malone to Lake Placid the tour traverses the Adirondacks region, with plenty of temptation to tarry. Lake Placid is perhaps the best known of all the Adirondack resorts, and is surrounded by high mountains. At the northern end the scenery becomes bold and imposing. Hoary old Mt. Whiteface raises its head 4780 feet high above the rest, cleaving the clouds in its solitary grandeur. All of the Adirondacks' gaunt peaks are in sight,

is said to have been brought here from France. An interesting drive along the lake from Ticonderoga brings the tourist to the ruins of Fort Ticonderoga, crowning a high hill near the steamboat landing.

The way then leads into Vermont, but only for a little time, then back and forth across the line, through country that is rich with inspiring views and over roads that are exceptionally good, until Hoosick Falls is reached. Near this town is the battlefield of Walloomsac, where occurred the conflict which has gone down in

At Left, View in the Vicinity of Richfield Springs; at Right, Island Dotted Lake in Catskill Foothills.

history as the battle of Bennington, fought on New York soil instead of in Vermont.

The last night stop is at Pittsfield, Mass., the Heart of the Berkshires. The way then leads through Lenox and Stockbridge, well known for the singular purity of their air. Many summer homes of wealthy people are located in this immediate vicinity and lend their beauty to nature.

The northwest corner of Connecticut is crossed before passing into the Empire state.

One of the distinctive features in the vicinity of Dover Plains is Chestnut ridge, which extends north and south for about three miles and forms a part of the water shed between the Hudson and Housatonic rivers. The small streams from the western hills

have worn deep ravines and in several places have formed beautiful cascades. A few miles from the village, one of these streams flows down the mountains in a succession of rapids, and at the foot of each fall smooth rounded holes, called wells, have been worn in the rocks to a considerable depth. Near this, and a little higher up in the mountains, is a stream which has worn a remarkable channel in the rocks, forming a cavern with a gigantic Gothic arch, known locally as "the old stone church".

## MECHANICAL NOTES FOR OWNERS.

### Outlining a Simple Method of Repairing a Broken Frame--Proper Adjustment of Fan Belts--Making an Emergency Tail Light.

**M**ANY times the motorist is confronted with minor troubles while on the road and occasionally a serious break occurs that taxes his ingenuity. The latter condition is more applicable to an old machine, as the manufacturer of the modern car has eliminated those faults which formerly gave trouble. The accompanying contribution, with an illustration, from a reader, is of interest in that it demonstrates that one can successfully surmount obstacles, as well as save considerable expense that would otherwise be involved. In the instance referred to, the reader made a repair to a broken frame and goose neck, and completed his journey of some 50 miles. As explained by him, the temporary repair was by no means difficult and the expenditure of but 15 cents saved him many dollars, to say nothing of

ble courtesy and that the stock cost but 15 cents. Of course there was considerable hard work, but I figure I saved several dollars, besides being able to get the car back home.

#### MAKING A TIRE PROTECTOR.

If one is so unfortunate as to be caught with a small blow-out and without an inside or outside patch, these can be made with some cloth and friction tape. Take a piece of cloth several times larger than the opening in the shoe and on one side lay strips of tape, much in the same manner as a surgeon plasters a cut. Next fold the cloth with the tape inside and lay a few strips of tape on the side that goes next to the inside of the casing. In replacing the inner tube be careful that the patch does not slip. If the shoe is cleaned carefully the tape will adhere. Partially inflate the shoe. Prepare another patch slightly larger than the opening in the tire, but tape both sides. Press the patch firmly against the blow-out and then wind tape around the shoe and felloe, taking care to have each wrap very snug. Inflate in the usual manner. This repair if properly executed will endure for some time and will at least serve to get one home.

#### FITTING NEW PISTON RINGS.

In fitting new piston rings to an old cylinder, the walls of which are smooth, it is an excellent plan to stone the rings before placing them on the piston, if they are simply of the machined type. It is an easy matter to create a glass like surface by polishing the periphery of the ring on an oil stone, using plenty of lubricant. A slight pressure should be exerted and the ring turned from time to time to insure a smooth, even surface.

#### FAN BELT TENSION.

The fan should be given attention as it aids in keeping the motor cool. The tension of the belt is important, and care should be exercised in adjusting it so as not to have it too loose or too tight. With the majority of cars provision is made for taking up any stretch of the belt. Some employ an eccentric as with the Overland, shown in an accompanying illustration.

Showing How a Broken Frame Was Repaired, Enabling Owner to Complete His Journey.

the immediate use of his machine when needed. His letter follows:

Noting several contributions to your notes for owners, I am enclosing a rough sketch of a repair I made to my car. I was unfortunate in having the frame break at the point shown in the drawing, and this took place some distance from a garage. The frame settled almost to the axle, but by jacking up the former, I was able to place a block of wood under it, and by driving slowly made the nearest garage.

I was advised by the proprietor, who called in his head repairman, to leave the machine or else attempt the return trip with the frame blocked up. As the roads were very rough I did not deem the latter suggestion advisable. After a little study I evolved the plan shown in the drawing. I took two plates .1875 inch thick and cut these to fit the top and lower parts of the frame as shown in the sketch. Next I jacked up the frame and bent it back into shape, after which I drove out the rivets holding the goose neck.

The plates were then drilled to take .375-inch bolts, clamped over the frame and locked. The car was then tried out, and the nuts again tightened. The repair held, although the roads traversed were very rough. I might add that the owner of the garage extended every possi-

To increase the tension of the belt the locking nut is loosened, also the bolt member, and the eccentric partially rotated. It should be borne in

Fan Adjustment on Overland Cars.

mind that a belt that is too tight will subject the fan bearings to undesirable stresses. It is also a good plan to renew the supply of lubricant in the grease cup and to turn this member down occasionally.

Belts that have become saturated with grease may be cleaned easily with gasoline. Inspect the bearings from time to time as with the fan near the radiator undue play might result in the blades cutting a hole in the cooler.

### LOCATING LEAKS.

Small leaks in the fuel system of the pressure type, in inner tubes, exhaust manifold, valve caps, spark plugs, etc., are not always located easily. A tiny puncture of an inner tube is troublesome and the usual method is to immerse the tube in a tank of water and watch for the arising bubbles of air. A simpler plan is to make a solution of soap and water and smear the tread. The smallest of leaks will be noted easily by large bubbles. An oil can filled with the same mixture is handy for testing the fit of the valve caps, spark plugs, etc., and has an advantage over the oil method in that it is cleaner to handle.

### CLEANING MAGNETO.

While the magneto does not require attention other than an occasional oiling and in accordance with the instructions of the maker, it is a good plan to remove the breaker box and distributor covers and clean the components of these members. A small, soft brush will be of service, as with it all foreign elements may be displaced easily. This should be done at stated intervals, especially if the magneto is exposed to dust, etc.

### FITTING BLOW-OUT SLEEVES.

Many motorists make it a practise to carry a blow-out patch and a tire sleeve. When the lat-

ter is of the lace-on type, the shoe should be only partially inflated and the lacing drawn up snugly, after which the pumping of the tire will tend to keep the sleeve in place. If the blow-out is near the bead, several layers of canvas placed over the hole and a patch on the inside will enable one to reach home, as the canvas forms a compress.

### CUP GREASE MIXTURE.

The practise of the manufacturer to provide grease cups for parts subject to friction is becoming more general. While makers of lubricants produce grease especially adapted for the parts, an excellent compound may be made by mixing a small quantity of powdered graphite with the grease.

### AN EMERGENCY TAIL LIGHT.

In some cities the ordinance respecting the tail light is strictly enforced. With either the kerosene or electric units it is possible that they may be injured through accident so that a new one is required. This means leaving the car or risking arrest. The manner in which a reader improvised a tail light from a trouble lamp demonstrates how easily troubles may be overcome. The temporary lamp and the manner in which it was constructed is depicted in an accompanying illustration.

Am enclosing a sketch showing how I made a tail light from a trouble lamp, and the suggestion may be of value to some of your readers, especially if they motor where the officers are very strict about the law regarding the rear light. My tail light uses kerosene, and was so badly damaged by another car backing into it, that it looked as if I would have to leave the machine until I could get a new lamp.

Not caring to leave the car or take a chance of being

Ingenious Method of Converting Trouble Lamp into a Tail Light by Fitting Red Paper Over Lens.

arrested, I solved the problem by taking my electric trouble lamp and covering the lens with some red paper. The latter I secured at a nearby store. By using friction tape it was an easy matter to hold the paper in position.

I then lashed the lamp to the tail light bracket and connected the battery. The result was a very good red light. There was no white light on my license plate, but I got home safely, although I was stopped by one officer, to whom I explained my predicament, and who allowed me to proceed on my way.

### DEMOUNTABLE RIMS.

The new owner as a rule does not give his tire equipment any consideration until a puncture or a blow-out compels him to make a change. This lack of attention is due largely to the fact that demountable rims are fitted and that an extra casing is carried on a spare rim. Invariably in attempting to replace a punctured tube with a new one, trouble will be experienced if one is not familiar with the components of the rim.

In an accompanying illustration is shown a sectional view of the Firestone quick detachable, quick demountable rim; a construction with which the tire may be taken off easily with the

Components of Firestone Quick Detachable, Quick Demountable Rims.

rim on the felloe, or both removed as a unit. The components are lettered and a little study should enable one to grasp the principles involved.

To remove the demountable rim and tire, the wheel is jacked up and the brace wrench employed to loosen the rim nuts. Next slide each rim clamp as far as it will go to permit removal of the clamping ring, which retains the rim proper. Lock the nuts by the fingers, else they will slide back into their original position when the rim is being removed. Turn the wheel so that the valve is at the top, then swing out the lower side of the rim and lift it with its tire off the wheel. The valve hole in the felloe is tapered to permit easy operation, as well as to prevent injury to the valve stem.

It is not necessary to displace the dust cap in the work. It should always be kept screwed up

tightly against the valve sleeve, except when detaching the casing from the rim. No lock or milled nut is necessary with the valve stem. The valve sleeve, in connection with the dust cap, holds down the spreader and prevents entrance of water through the valve hole in the rim base.

To mount a spare rim with its inflated tire: Take the clamping ring which has been removed and place it in the same position; that is, with the point of the wedge toward the inside as shown in the drawing. Next turn the wheel so that the valve hole in the felloe is at the top, insert the valve stem through the hole and swing the lower part of the rim into place. The rim nuts are then loosened and slid into the position shown in the drawing and locked by the brace wrench. After locking each member, go over them a second time to make sure they are snug.

To detach a shoe from rim without removing latter: The wheel is jacked up, the dust cap removed and the plunger of the valve depressed to allow any existing air in the tube to escape. Next push the valve stem up as far as it will go, thereby releasing the spreader inside the casing and making easy the work of dismounting the detachable mechanism. Push the clincher side ring in as far as it will go and until it is entirely disengaged. Insert any convenient object between these two rings, near the end, of sufficient size to permit of the locking rim clearing the side member. By inserting a screw driver in the slot at the end of the locking rim, and by prying, the rim should be moved out of its groove. By passing the blade of the tool under the ring it may be sprung out easily. The clincher side ring may now be removed. The tire is displaced by moving it outward, commencing opposite the valve, then lifting it out at this point so as to prevent injuring the valve stem and tube.

Before fitting a new tube, clean the interior of the casing and use plenty of soapstone. In replacing the tube in the shoe be careful not to have any twists or wrinkles. The shoe is next replaced, then the side ring and the locking ring. The last named is applied by engaging the pin in the notch in the edge of the rim and by forcing the locking ring into its groove around the wheel. After inflating the tire to the pressure recommended by the maker, replace dust cap, screwing it snugly against the valve sleeve. The maker of the Firestone rims advises that the valve sleeve supplied with every set of quick detachable, demountable rims, be used, as it prevents the side ring from becoming disengaged from the split ends of the locking ring. It also serves to prevent moisture from reaching the tire around the valve stem.

## WITH THE MOTORING INTERESTS ABROAD.

### Results of the Recent Third International Road Congress in London, England— More About Geneva Conference on American Invasion—Foreign Notes.

MUCH time was devoted to subjects intimately connected with the use of motor vehicles at the third international road congress, which convened recently in London, England. The keynote may be said to have been sounded by Lloyd George of England in his speech of welcome, in which he referred to the revolution which has come about in the use of roads through the development of motor traffic. He did not think this a matter to be deplored, for the more communication was improved the less was spent on distribution, and the more was available for production. Bad roads, he declared, meant a horse taken away from the plow and attached to a cart.

Accredited delegates were present from 39 governments, representing practically every civilized country in the world. And as usual with such gatherings, much of the business was transacted in sections and by sub-committees.

The first section was devoted largely to the consideration of reports from nations concerning the planning of new roads and streets, and resolutions embodying the suggestions, were adopted. Chief among these were that new main roads should be constructed to pass outside rather than through cities and towns, and that the planning of main road communication outside towns should be undertaken at once, the initiative to rest with a central state authority. The subject of road surfacing also was taken up and certain recommendations covering wood block paving, and asphalt for bridges and easy gradients, were adopted.

The second section took up the matter of road lighting. It was decided that it was quite clear that as country villages and urban districts could not light the roads in a way adequate for modern traffic, therefore the user must carry his light with him. Thus it will be seen that the international road congress has placed its seal of approval on the subject of universal lighting, so-called. It also was decided that motor lights should be proportionate to the speed and should enable the driver to see an obstruction at least twice as far off as the distance in which his brakes could pull him up. Resolutions were adopted that in inhabited places the headlight should be limited to the illuminating power of an ordinary lamp,

and that one color should be adopted as a danger signal.

The third section took up the question of highway administration. The reports from the different nations showed a greater tendency toward larger centralization. It was decided that the task of constructing roads should be placed in the hands of larger units than the local authority. A Belgian delegate advocated the state control of all roads, but the conclusion reached was that it was difficult to make one rule which would apply to all countries.

The business of the congress naturally covered a wide range, and it would prove impractical to review the entire proceedings here, were it possible to condense all the various reports and papers presented. The general principle of the following conclusions was approved:

1—The expenditure on the maintenance and improvement of (a) the roads which serve as main routes of communication between important places in any country or (b) the roads which are used mainly by long distance traffic, unless such expenditure is borne wholly out of national revenues under a system of state administration of roads (which system is practicable and suitable in the case of some roads in some countries), should be mainly paid out of the national revenues, whether or not such roads are locally administered and maintained, subject, where local administration prevails, to the supervision of a central government authority both as to efficiency and expenditure.

2—It is desirable to abolish, so far as possible, all tolls on public roads, but it is equitable that the owners of vehicles which, on account of their weight or weight combined with speed or any other exceptional circumstances connected with either the vehicle or the use of the road, cause special damage to roads beyond the wear and tear of the ordinary traffic of any district should be subject to special taxation, the proceeds of which should be earmarked for expenditure on roads.

3—Borrowing money for new road construction and for the periodic renewal of the surface coating of a road is consistent with sound financial principles, provided that the loan period in the case of loans for renewals is kept well within the life of the surface coating.

Another important point discussed was that dealing with the construction of macadam ways bound with tarry, bituminous or asphalted materials. This occupied much time and brought out many interesting details. The main decision reached was that it was important, both in the interests of the duration of the road and the comfort of the users, that repairs should be made immediately a defect showed itself. Concerning the main proposition, a Russian delegate suggested that a committee be appointed to investigate the various methods used in different parts of the world and report at the next congress.

In the matter of traffic regulations the following conclusions, as prepared by Lord Montagu of England, editor of *The Car* and an international motorist of note, were adopted after long discussion:

1—That all regulations for the control of road traffic should be based on the principle of allowing the speed practicable for each different kind of vehicle consistent with public safety, general convenience and the normal wear of the roads.

2—That regulations for the conduct of fast and slow traffic should be as few and simple as possible, and should be such as can and ought to be universally adhered to and enforced.

3—That in large cities there should be a traffic authority on whom should be charged the duty of studying and dealing with street traffic problems, the powers of such authority and the co-ordination of such powers with those of other public authorities being matters of detail which must be settled by public authorities on consideration of the circumstances and conditions of each large city.

4—That there should be ample provision of traffic controllers (such as the police in London) with adequate

**Ten-Year-Old Waverley Electric in Service in England.**

powers to regulate the traffic, not only at congested points, but throughout the course of crowded streets.

5—That having regard to the increased danger which is necessarily created by the conditions of modern traffic, it is important that drivers should be carefully and systematically trained, and that children should be especially taught how to provide against the dangers of the road.

6—That except where local circumstances render it absolutely necessary, no obstructions, such as lamp posts, tramway standards, etc., should be placed in the centre of the road, except necessary refuges for pedestrian crossing.

7—No obstruction of the public highway should be permitted either by vehicles standing unreasonably, or by things placed on the highway. Exception must, however, be made for depots required for the work of maintenance or repair of the road, and for work being carried out by duly authorized and competent authorities, but in every case all necessary steps must be taken to insure the safety of traffic.

8—That regulations for roads and traffic must aim at defining the rights, duties and responsibilities for each kind of traffic in order to avoid the causes of accidents and damage, and to insure the maximum of order and liberty.

## TEN-YEAR-OLD WAVERLEY.

### British Owner Finally Decides It Is Time to Secure New Model.

The question often arises as to the life of an automobile. As a matter of fact it is still impossible to give the answer; the automobile industry is much too young, apparently. Many machines have been in service for several years, although it is admitted that most Americans prefer to exchange their cars for newer models after they have had them a few years. The tendency in this respect is not so marked as it was formerly, however.

Nicholas Kilvert, Brooklands, Cheshire, England, managing director of the Lancashire Dynamo & Motor Company, Manchester, has a Waverley electric runabout, made by the Waverley Company, Indianapolis, Ind., which he purchased in 1903. The factory number of the car is 1150. It has been in almost constant use since that time, and it was only within a month that Mr. Kilvert finally decided to part with it, ordering a model 98 Waverley limousine to replace it.

No record of its mileage has been kept. The owner says that the expenses have been very trifling, the renewal of batteries and tires being the chief items. The charging power has been obtained from a plant at the owner's residence, and it is his belief that £5 a year would cover this. Fire insurance only has been covered, as other risks have been considered too slight to justify any protection. The machine has been used almost daily, six days a week during the 10 years, for station work and social purposes, on country roads in Cheshire, being driven almost exclusively by the owner's daughters.

## GENEVA CONFERENCE.

### French Makers Were Not Represented and Do Not Fear American Invasion.

The Geneva conference, which recently entered a protest against the American automobile invasion, was not so international and not so precise in its objects as appeared, according to a later report received from Paris, France. Also, it was not representative, as none of the French firms was aware the congress was to be held and none sent delegates.

Louis Renault, who presided, was not the automobile manufacturer of that name, it is stated, but a professor of law. M. Renault, the automobile maker, is at Paris, but has refused to discuss the subject of the congress. Marquis de

Dion said: "I regret that America's charges for tariff are 45 per cent., when we charge 10. If we wanted we could build automobiles of the same class and price as the American, but at present I do not see the necessity."

M. Koechlin of the Peugeot firm said: "I welcome the invasion, as it opens a new market for us, especially abroad. American competition in France is not dangerous. American low priced machines appeal to a certain class of buyers. It is impossible for us to produce such a cheap machine here, as labor conditions are different, but we do not want a cheap market."

M. Weydert of the Darracq company stated: "If the invasion is to be fought, the best way is by copying American methods. American competition does not hurt us, as the French automobiles are sold at the same price always and have the preference of 75 per cent. of the buyers. It is a mistake to imagine we could not produce automobiles as cheap as America, as labor is cheaper here."

M. Dury of the Turcot-Mery firm, contented himself with the statement that "there is no need to fear American competition here."

So far as the French makers are concerned, as appears from the Paris report, the Geneva congress was merely a gathering of alarmists, as the European makers do not fear competition with high priced machines, trade in which is their staple line. Such being the case, they take the stand that America's cheap machines have a decided place in their market. The same is held to apply in England, although perhaps to a lesser extent.

### SALTBURN SPEED TRIALS.

#### American Cars Show up to Advantage in at Least Two Events.

The speed trials on Saltsburn sands, England, have come to be considered as part of the annual series of classic events held in that country. The number of competing cars this year was a record one and all of the 19 events on the programme were carried off promptly. In the absence of a quick drying sun the surface was soft and wet and the heaviness of the course doubtless retarded the cars. This was especially so on the side nearest the sea.

The cars were started on boards, these being about 30 feet in length, but the dampness of the tires caused considerable slipping. In event N, the winner proved to be an American car, A. E. George's 20 horsepower Ford. In the first heat,

J. Atkinson in a Bedford-Buick won, the time being 50.8, or a rate of 44.03 miles an hour. Others in this heat were E. Lisle in a Briton; Rowland Winn, Ford; J. Stringer, Winco. This was a very close race, the Ford, fitted with a pointed radiator, losing by only a length.

The second heat was won by A. E. George in his Ford, the time being 46.2, or 48.41 miles an hour, the margin of victory being about 40 yards. Other cars were H. Nelson Smith, Hillman; W. H. Isherwood, Salmon. In the final the time made by the Ford was 45.6, or 49.26 miles an hour. The prize for this race was the Royal Automobile Club's gold medal and the Y. A. C. cup.

In the final of event P, J. Atkinson in a Bedford-Buick won and J. D. Gray in a 28-32 Buick was third, second place going to Nelson-Smith in a Hillman. Five heats besides the final were necessary in this event, owing to the fact that in no less than three heats the winner was disqualified because of exceeding his speed allowance. Among these was Rowland Winn in his Ford, he having won the second heat.

### NEWS NOTES FROM FOREIGN LANDS.

An enterprising baker at Eaglehawk, Victoria, Australia, has demonstrated the advantages of motor delivery by installing a light van, with which he has been able to extend his delivery into the surrounding districts and thus materially increase his business.

The authorities of the Swiss canton of Glarus are still showing a strong anti-motorist tendency, having forbidden the driving of motor cars on Sundays between the hours of 9 in the morning and 6 in the evening, during the months of May, June, July, August and September, throughout the entire canton.

The Austrian postal authorities recently placed in service 30 electric motor mail vans for use in Vienna and suburbs. The machines are used principally for the transportation of mail to and from the railroad stations. A new postoffice garage, capable of housing 50 electric, has been erected in Vienna.

The automobile is coming more into use in Sweden and the trade during 1912 was better than in 1911, when 532 automobiles, valued at \$434,080, were imported. Of this number the United States supplied 93, valued at \$80,162; Germany led the trade with 199, valued at \$184,958, while Belgium sold 107, valued at \$60,422. Only Germany can be considered a serious competitor. Its proximity and the granting of long credits accounts for its success.

Recent reports from South Africa indicate that the average cost of running motor vehicles in that district is about 12 cents a mile. This is held to include use in towns and open country, although in the latter instance it is found that mere tracks exist in lieu of roads. The inhabitants are rapidly coming to recognize that the success of mechanical transport depends very largely upon better highways and a movement is under way to further good roads work in several localities.

As a result of the recent competitive tests held at Ciulnita, Roumania, under the direction of the Sindicat Agricole of the Jalomitza, a co-operative agricultural institution, gold medals were awarded to two American houses, the Emerson-Brantingham Implement Company and the Pioneer-Isacelles. Three silver medals also were given to American machines. The cup of honor was awarded to the Lanz firm of Mannheim, Germany. The names of the winning American machines were not forwarded to this country.

gress of March 3rd, 1879.

---

**THE GRADE CROSSING.**

---

It undoubtedly is true that it would prove a financial impossibility for the railroads of New York State, or in almost any other section for that matter, to eliminate all of the dangerous grade crossings in one year, or possibly in 10, as suggested by the Touring Club of America in a communication to Gov. Sulzer appearing elsewhere in this issue.

The attempt of the organized motorists in New York City to secure better conditions in this respect is praiseworthy, but there is room for much criticism in the remedy suggested in the letter to which reference has been made. Briefly, the Touring Club would ask the railroads to erect a permanent barrier, which must be operated by the highway user. Undoubtedly this

would protect the motorist, but why should he be compelled to act as his own gate tender?

Modern traffic conditions demand that the grade crossing shall be eliminated in the interest of public safety. The railroads also have a financial interest at stake, since it can be argued, solely on economic grounds, that it is cheaper in the end to provide against accidents than to meet the expenses attendant upon them. There ought to be no reason why the railroads should not be compelled not only to erect suitable barriers, but provide men to operate them so long as the financial need for maintaining the grade crossing continues to exist.

---

**INTERNATIONAL ROAD CONGRESS.**

---

It is impossible to measure the results of the international road congress held every third year, for the reason that much of the business is in the form of reports and recommendations contained within printed documents which will later be assembled for distribution to highway authorities throughout the world. There is little doubt, however, that the conference held recently in London, England, was of decided value to motorists.

Three important decisions were reached, although, of course, none of these has the force of legislative authority. The representatives of 39 governments, after full and free discussion of the problems involved, have expressed as their opinion that the proper method of regulating traffic should be based on the principle of allowing the speed practicable for each different kind of vehicle consistent with public safety, general convenience and the normal wear of the roads; that it is impossible to light the roads in a way adequate for modern traffic, therefore the user must carry his light with him, and that it is important, both in the interests of the duration of the road and the comfort of the users, that repairs should be made immediately a defect shows itself.

These decisions have the effect of recommendations. Unfortunately, although the United States was represented by delegates, the national government, as such, has no power to act upon the recommendations. This power is relegated to the several states, and to these is officially presented the principles of reasonable and proper speed regulation, universal lighting and some method of road patrol which shall bring to light the defects as they appear.

## ELIMINATING THE GEARSHIFT LEVER.

### Adoption of Electrically Operated Transmissions Announced by Several Makers--- Construction and Operation of Other Forms, Pneumatic, Hydraulic, Etc.

**W**HEN one considers the thoroughness of the motor car manufacturer in equipping his product with time and labor saving devices, as

Fig. 1—Control of Vulcan Electric Gearshift: A, Form Utilized on S. G. V. Car; B, Suggested Location Making for Convenience.

well as those making for comfort and convenience, it is but natural to indulge in speculation as to what the 1914 season will bring forth. There are some who will contend that the manufacturer can only incorporate minor improvements and refinements in his new models, a contention based on the 1913 equipment, but it may be anticipated that the progressive maker will give further evidences of his ingenuity. The very general adoption of motor starters and electric lighting, indicates that the effort of the designers is toward relieving the motorist of all manual labor, other than steering and acceleration, in the operation of the car.

This is in decided contrast with conditions existing several years ago and before the equipment was given serious consideration. Placing a spare tire on the rim and inflating it was real work. Now the demountable rim with quick detachable features and power tire pump enable rapid changes with a minimum of labor. The perfected ignition systems, with the magneto as the main source of current supply, has relieved the motorist of the care of batteries, other than an auxiliary. The raising of tops can be accomplished by one person, and curtains may be attached from the inside, an operation formerly requiring two, while the motor may be started and lamps lighted or extinguished from the seat by pressing a pedal or turning a switch button. Seat control is very much in evidence, it being possible to regulate the mixture, while gauges indi-

cate the supply of fuel and lubricant. These and numerous other devices and the stability of the modern automobile has reduced the labor attendant upon motoring to a minimum as well as made it possible for a novice to complete successfully long tours with comfort.

In considering the possibilities of the future; that is, devices eliminating exertion on the part of the operator, there remain two factors—the changing of speeds and the application of the brakes. That the leverless gearshift is being given consideration by the manufacturer was evidenced by the adoption of an electrically operated transmission displayed for the first time on an S. G. V. car at the Boston show. And there is reason to believe that other forms will be seen at the 1914 shows, in that several transmissions operated by compressed air, fluids, etc., have been announced recently.

All of these permit of a change of speed or shifting of the gears in the gearset, by pressing a button, as with the electric type, or by moving a lever on the steering wheel or column. The inventors of these systems point out several advantages, these including safety, in that a change of speed may be made without removing the hands from the wheel; and convenience, in that the control unit is very accessible and a change easily and quickly effected, and that operation in traffic is facilitated as a contemplated speed may be set in advance, thus saving time. It is

Fig. 2—Sectional View of Vulcan Electric Gearshift, Showing Solenoids and Clutch Pedal Control of Knife Switch.

also claimed that with some forms a quieter engagement of the gears is possible and that mistakes in shifting are avoided.

In presenting the various forms of leverless transmissions no attempt is made to describe all designs, but to explain the principles involved, their application and the method of operation of a sufficient number of types to familiarize the reader with the subject.

The leverless transmission may be divided into three classes, namely: Electric, compressed air and those of the hydraulic type. Dealing with the first named, it may be stated that the system is not complicated, being controlled by solenoid coils, one for each forward speed and reverse. At Fig. 2 is presented a sectional view of the Vulcan electric gearshift as fitted to the S. G. V. car, and the arrangement of the solenoids and clutch pedal control is shown. Two switches are employed between the battery and solenoids, a knife

which method desired speed change is secured.

The plungers are shown in a neutral position in the sketch and when the button is pressed on the control member a 12-volt current passes through the coils around the plungers, drawing them against the magnets. The current required to make the shift is held to be about 17 amperes and it is stated that 300 changes of speed may be made with less current than is required to start the motor. It is also held that gears cannot be stripped because the clutch must be disengaged before a shift is made, and that the gears are always in neutral before the solenoids accomplish the change. This is a purely mechanical action through means of the clutch movement. No two speeds can be utilized at the same time because each speed is governed independent-

Fig. 3—Schnitzler Electro-Mechanical Gearshift by Which Changes of Gears Are Automatically Governed by the Load—The Driver Has No Control of the Speeds.

switch controlled by the clutch pedal and the push button member located on the steering wheel. The first named switch controls all of the changes, while that on the wheel arranges the circuit for the particular speed desired.

As indicated in the drawing the clutch pedal moves through a link during the first part of its motion and during the balance picks up the link and carries it along with it. Thus it will be seen that the first movement is the conventional operation of the clutch, but the completion of the throw actuates the knife switch, current flowing through the solenoid coil and pulling a plunger against a magnet with a force of approximately 150 pounds. The energy is transmitted through an arm to the gear shifting fork and gear, by

ly of any other and an interlocking device prevents the use of two buttons at once by mistake.

The control buttons and their housing mounted on the spider of the wheel are shown at Fig. 1 A, being designed for a four-speed transmission, and include in addition the conventional reverse and neutral positions. The operation of the system is very simple. If the fourth speed button is pushed down, the clutch thrown out and then re-engaged, the machine will be in the fourth speed. In travelling in traffic on the third, the driver can set the second speed button and by depressing the clutch pedal fully, shift into second. Similarly changes may be made up. If two buttons are pressed at the same time, but one will go down, or if one be pressed while another

Fig. 4—Control of Gray System.

is down, the latter will jump up. If the second speed button is pressed down while operating in the third, and the clutch depressed fully, the gears will shift regardless of the elapsed time.

The box containing the switches and solenoid coils is mounted at the side of the gearbox and it is stated that it adds but 46 pounds to the weight of the chassis. It is held that the system is quiet, the only perceptible noise being a slight click as the gears engage in the changing to the different ratios. The sketch at Fig. 1 B is a suggestion for locating the buttons in that it would make for greater convenience of operation. This make has been adopted by several concerns since the first of the year.

The possibilities of the leverless gearshift are noted in the Schnitzler electro-mechanical device, designed and patented by Oscar Schnitzler of Minneapolis, Minn. This differs from the one previously described in that the most advantageous gear ratio is automatically provided, the changes being made to higher or lower at the exact time required, and without the assistance of the driver whose only control is the clutch, to start or stop, and a special reverse connection. The principle involved is that of weighing the torsional load on the drive shaft, the selection of the gears being automatically governed by the load.

Two separate mechanical devices, electrically connected, are employed, these being the governor and the shifter. The former, which is the weighing member, comprises two pairs of gears on different shafts, as will be noted at Fig. 3. One pair is secured to adjacent ends of the divided drive shaft, and meshes with the other pair, which is integral with a counter-shaft. The latter is mounted in a casing which is free to rotate on the drive shaft, but restricted by a spring. A section of this case is in the form of an extend-

ing arm, carrying a gear, moving on a toothed rack. On the face of the rack is a series of contact pieces, and a contact arm is provided with corresponding members. The arm is secured by a friction bearing to the pinion.

When the machine is at rest and with no load on the drive, this arm is pulled to one side, the left, for example. Applying a load to the drive results in a tendency to revolve the gear train about the drive shaft, leaving the driven half of this shaft stationary. This rotation, however, is restricted by the spring, so that the drive is transmitted through the gears to the driven shaft. If the road resistance and driving torque be similar, the arm remains stationary at the left. Upon the load becoming greater than the driving torque, and the necessity of a lower gear arising, the resistance of the spring is overcome, and the lever is moved to the right. In this movement contact is made between the stationary contact pieces and those on the rocking member C, which connects with the shifter, actuating the latter and decreasing the gear ratio. A decrease in the road resistance results in the contact member moving in an opposite direction, and changing to a higher gear.

The shifter, contained within the gearset case, consists of a train of four gears attached to a rocking frame, and constantly driven from the drive shaft. These gears comprise a driving, idler and two driven gears, G and H, one meshing with the idler and the other with the driving member, thus being driven in opposite directions. These gears are adapted to mesh individually with a pinion P on the shifter shaft, when the gear frame is rocked to the right and left respectively, thus driving the shaft in either direction. The shifter rod is threaded throughout its entire length to correspond with the shifter sleeve, carrying the shifter fork for the progressive sliding gearset, which is utilized with the de-

Fig. 5—Gray Pneumatic Gearshift: A. Showing General Arrangement; B. Detailed Section of Shifting Mechanism and Components.

Fig. 6—Showing the Path of Oil in Kerfoot Hydraulic Transmission When Machine Is at Rest or Reversed—There Is No Circulation During Forward Speed.

vice. The rocking frame is controlled by a pair of electro-magnets, M and N, wired respectively to the contact pieces on the right and left portions of the governor segment. An angle lever is connected to the clutch and bears on its roller upon the cam face of the shifter nut, so that upon any movement of the latter wherein a gear is drawn from mesh the roller is raised out of the notch, forcing the clutch out, until the next gear is in mesh, when it drops into the notch opposite, and re-engages the clutch.

The action of the device is as follows: In taking a load, as in starting or climbing a hill, the torsion on the divided shaft is so severe that the case and the governor arm are thrown to the extreme right, making contact at C, exciting magnet M, and rocking the shifter frame to the right. The gear shifter G is thus meshed with the pinion P and the shifter rod is revolved, moving the shifter sleeve backward, throwing out the clutch, meshing the lower gear, and re-engaging the clutch. On the torsion becoming sufficiently less severe to warrant a higher gear being used, the governor arm is drawn to the left, and a contact is made on the opposite side of the governor segment, exciting the magnet N, which draws the shifter frame to the opposite side, engaging driven gear H, which drives the shifter pinion and shaft in the opposite direction. The shifter nut is also moved forward, engaging second speed. In the same way progress is made to the third and fourth speeds, or vice versa.

An example of the pneumatic gear shifter is noted in the Gray system, brought out by the Research Company, Plano, Ill., the components of which are shown at Figs. 4 and 5, the former illustrating the wheel indicator and control. With this device it is possible to start the motor and inflate the tires in addition to gear shifting. A three-cylinder compressor is utilized, which may be attached to the crankshaft as best meets requirements. Its operation is controlled by a pneumatic valve which maintains the proper working pressure. The valves

of the compressor are also arranged so that the unit is converted automatically into an air motor by means of a lever on the dash. When operating as a motor starter the gear ratio is 4:1. As a compressor it is 2:1.

The sectional view at Fig. 5 B shows the components and their relation to one another, while the arrangement of the system is illustrated at A. It will be seen that the Gray system is practically a piston operating in a cylinder and that control is by means of a selector mechanism and an air distributor.

The shifter rods S of the gearset are cut to form racks, and the idler racks I I are differentially geared to the lower shifter racks by means of the gear pinions G G. The extremities of all four racks have slots into which a selector finger slips when rotated by the steering wheel indicator. The selector finger is integral with the piston rod P R, the piston P and the controller long

Fig. 7—Longitudinal Section Through Valve Chambers and Oil Passages of the Kerfoot Hydraulic Transmission.

pinion P L. The assembly rotates with the stationary cylinder C, being actuated by the gearing from the steering wheel controller. The function of the racks is to transmit a pushing motion to the shifter rods, when drawn forward by the selector finger on the forward or engaging stroke of the piston, to correspond with the forward slots of the conventional H gate system. The reverse movement, that of pulling the shifter rods forward, is obtained by the direct engagement of the selector finger with the shifter rod slots.

The air distributor is controlled by the clutch position. With the clutch engaged, the valve is closed, but when disengaged, the valve is in the position shown at B, admitting air behind the piston and forcing it backward. The piston rod is provided with a neutral collar, and on the back-stroke throws the forward rod back even with the rest, drawing any engaged gear out of mesh and producing a neutral position. A further depression of the clutch pedal closes one port and opens communication with another one, forcing the piston forward, the finger drawing the rod selected by the position of the wheel controller.

The operation of the system is to first place the gears in a neutral position by a downward pressure of the clutch, then engage the gear indicated by the selector by re-engagement of the clutch. As a certain amount of clutch travel is provided it is possible to slip the clutch as in usual practise. The reverse position on the wheel is provided with a latch to prevent shifting into it by mistake. It will be seen that the operator can move the lever on the steering wheel to second, for example, when driving on the third. Upon depressing the clutch pedal and slowing the car the gears are shifted to neutral, but upon re-engaging the clutch the second gear will be in mesh, this having been performed automatically as above explained.

A device replacing the usual clutch and transmission is the Kerfoot hydraulic transmission, designed by E. L. Kerfoot, Hutchinson, Kan., and shown at Figs. 6 and 7. For a 60 horsepower motor it weighs about 100 pounds, is 12 inches long and 10.5 in diameter. The device comprises two rotary pistons placed end to end with a telescoped shaft, the pistons operating in concentric cylinders with a dividing wall between them. Each piston is provided with two or more recip-

rocating blades actuated by oil sealed in the cylinders, and the latter have hollow sliding valves and ports for controlling the circulation of the fluid. When the ports are closed circulation ceases and the oil is compressed in the cylinders causing the unit to move forward as a whole, and providing a direct drive forward. With the ports wide open the oil is allowed to by-pass, relieving the compression in the cylinders and obtaining a neutral condition of the transmission. Any ratio other than direct drive is obtained by closing the ports partially until the desired compression is produced in the cylinders. For the reverse drive one set of valves is opened, allowing the piston to drive oil from the forward cylinder to the rear in such manner as to cause the rear piston to rotate in a reverse direction. The ports are arranged in such positions as to allow all valves to be attached to a common shifting collar. The extreme limit of valve action is 1.9375 inches.

Fig. 8—Schlesari Hydraulic Transmission: A, Pump and Casing; B, Control Cock Operated by Driver; C, Direction of Rotation of Pump and Position of Cock During Forward Movement of Vehicle.

The clutch action is obtained by blades in the driving heads placed radially or diametrically opposite each other, as shown at Fig. 6. These blades are held out against the inside of the body by compression springs. The inner bore of the body is eccentric as regards the centre line of the driving heads. The driving and driven shafts are depicted at Fig. 7 A and B respectively.

To reverse the machine with the driving shaft A rotating clockwise and the valves uncovering the oil passages, the oil circulates as follows: Beginning at C (Fig. 6) in the driving chamber, the oil follows the full line through the port into the cored passage H, following the dotted line into the valve E, passing through this valve into the reverse head chamber, following the dotted line through this chamber into the valve F, thence through the cored passage I into the valve G and out into the driving chamber to C, thus completing the circuit, which is continuous, as the ma-

chine reverses. The blades force the oil out of the driving chamber into the reverse chamber from opposite sides, the oil impinging upon blades in the reverse chamber and causing them to move in an opposite direction.

With the machine at rest, the driving shaft A continues to rotate in a clockwise direction, the valve shifter K being moved toward the body of the transmission until the ports are covered, allowing oil to flow into the reverse chamber. At the same time the other ports are opened and the oil circulates as follows: Beginning at C (Fig. 6) the oil follows the full line into the valve F, through which it passes into the cored passage I and into the valve G. Thence the oil passes into the driving chamber and back to C, thus completing the circuit when the machine is at rest. During this period both the body of the transmission and the reverse shaft are stationary, allowing the driving shaft, which is connected to the motor, to rotate freely.

A forward movement of the vehicle is obtained by moving the shifter K toward the body, closing all ports and preventing circulation of the oil. With the driving shaft rotating clockwise, the blades tend to force the oil held in eccentric oil pockets through the opposite narrow space formed by the eccentricity of the chamber, which in turn creates resistance to the passage of the oil and a pressure in the chamber. This engages the body of the transmission, causing it to rotate with the driver. A similar action in the reverse chamber causes the body to engage with the reverse head, thereby driving the entire transmission and shafts in a clockwise direction and propelling the car forward.

The Schiesari hydraulic transmission, the invention of Mario Schiesari, New York City, sectional drawings of which are presented at Fig. 8, consists of regulating the flow of liquid from the pump to the receiving motors in such manner that the liquid is caused to act against the entire surface of the driven pistons, or a portion of the same. It provides a combination of a pump at constant speed, stroke and volume, but varies speed by varying the surface of action.

The receiving portion of the transmission consists of several pressure chambers arranged side by side by dividing a single chamber into several sections of uniform size. A pump A connected to the motor shaft forces liquid under pressure to a distributor enclosed in the casing C, its function being the distribution of the liquid in the sections of the two receivers D D. Each of the last named controls one of the two rear wheels of the machine, eliminating the conventional differential. The pump rotates in the direction of the ar-

rows indicated at B, and the cock E is utilized by the operator for controlling the device.

With the cock in the position shown at C the oil circulates in a closed circuit, the pump rotating freely. With the cock located as shown at B, the liquid is circulated through the receivers, giving a forward motion to the car. With the cock E properly placed the pump circulates the fluid in an opposite direction through the receivers, obtaining the reverse movement. One of the advantages claimed in the construction is that the motor may be cranked by the energy transmitted by the rear wheels after coasting down a grade by turning the valve E to the position shown at C. The receiving motors are directly connected to the driving wheels of the vehicle, both motor and wheel being mounted on the same shaft F. It is obvious that no gears are required.

In considering the matter of brakes it would not be unreasonable to presume that the future will see at least one set of these members, the service, operated by a small lever on the steering wheel. Compressed air is successfully employed on electric and steam trains and by certain modifications could doubtless be applied to the motor car. In reviewing the present equipment and the possibilities of the future, it may be said that the driving of an automobile will ultimately require no other manual labor than steering.

### A SPLENDID OPPORTUNITY.

#### Government of Mysore, India, to Loan Purchase Price to Its Employees.

As an instance of the recognition that is now given in southern India to the great advantage in using motor vehicles as a means of rapid transport, the government of Mysore has recently announced a scheme of making advances of money or salary to its employees for the purchase of either motor cars or motorcycles. For the purchase of automobiles a grant of \$1334 is to be given, or four months' extra salary, whichever is the lower, and for the purchase of motorcycles and sidecars a grant of \$500 will be allowed, or four months' salary, whichever is the lower.

In either case the money thus advanced is to be repaid to the government in 36 monthly installments, without interest. The loan will be secured by a mortgage which the government will hold upon the motor car or motorcycle purchased. The civil list of Mysore government employees can be obtained of the bureau of foreign and domestic commerce at Washington.

## DEFINING SIDECARS AND CYCLECARS.

**A** MATTER that surely will come up for discussion by the various state legislatures next session is that of defining sidecars and cyclecars. Some commonwealths do not differentiate between automobiles and motorcycles, and others exempt the latter from all or a portion of the provisions. And while in the latter instance it seems to have been the obvious intent of the legislators not to include sidecars in the automobile classification, the wording of the law in some instances is such that no other result can be obtained.

To cite an instance: The Massachusetts law defines automobiles as "all motor vehicles except motorcycles," and motorcycles as "motor vehicles having but two wheels in contact with the ground, and a saddle on which the driver sits astride." Connecticut describes a motorcycle as "a motor vehicle having but two wheels in contact with the ground." Several other states classify motorcycles without attempting to define them.

New Hampshire appears to be about the only state that has recognized the sidecar in its recent legislation, the old law, defining the term motorcycle as applying "only to motor vehicles having but two wheels in contact with the ground and with pedals and a saddle on which the driver sits astride," having been amended by adding, "but a motorcycle may carry a one-wheel attachment for the conveyance of a passenger."

Apparently owners of sidecars are safe in the states of California and Rhode Island. The former describes motorcycles as "all motor vehicles designed to travel on not more than three wheels in contact with the ground," and the latter as "only those motor vehicles having pedals, with the driver sitting astride."

### FINDS CLAUSE UNCONSTITUTIONAL.

#### New York City's Anti-Smoke Ordinance Is Declared Null and Void.

Justice Russell of the New York City court of special sessions finds the so-called anti-smoke clause of the sanitary code unconstitutional, and as a result it is understood that the prosecution of automobile owners for the emission of smoke will be abandoned. The decision is of interest because of similar clauses in the laws of certain states. It reads in part as follows:

Section 181 of the sanitary code makes it a violation to allow dense smoke to be discharged from any building, vessel, stationary or locomotive engine or motor vehicle in the City of New York. The section is unreasonable and arbitrary because of its unqualified and sweeping character, condemning as a nuisance a thing that may or may not be a nuisance, and because it makes no provision for cases where compliance is impossible. Such ordinance, prohibiting as it does the emission of dense smoke, irrespective of definitions, limitations and qualifications, is a restriction upon the owners of private property and repugnant to the provisions of the federal and state constitutions that no person shall be deprived of his liberty or property without due process of law.

### TO ABOLISH GRADE CROSSINGS.

#### Organized Motorists Demand That Governor Bring Matter Before Legislators.

It would appear that the organized motorists in New York City were determined that the dangerous grade crossing shall go. The Manhattan Automobile Club, the Automobile Club of America and the Touring Club of America have united in an effort to secure definite action by the legislature in 1914. The following letter to Gov. Sulzer explains the situation:

The rapidly increasing number of casualties to automobilists on Long Island and various parts of this state, due to the great number of railroad crossings at grade, has caused the officers of the Touring Club to give much thought to a possible remedy for this unfortunate state of affairs.

It has occurred that if your excellency could see fit, at the next regular session of the legislature, to present a message on the subject of grade crossings some remedial action could be taken for the protection of automobilists using the roads, as well as for the protection of the railroads themselves. Of course it is patent that it would be quite impossible to eliminate all grade crossings in a year, or even perhaps a decade, but something might surely be done to safeguard the users of the roads from the danger attendant upon crossing lines of railroads.

Would it not be possible to arrange for gates at all trunk line crossings, such gates, for example, as these: Iron gates spanning the width of the roadway on either side of the railroad's right of way which would be fitted with spring hinges and be constantly closed to motor and horse traffic. This would make it necessary for the driver or other occupant of the vehicle to dismount and hold the gate open while the vehicle was crossing the right of way, and the same process would have to be repeated on the further side of the railroad. Naturally one might expect a great hue and cry to be raised by the users of the roads citing the inconvenience of constantly stopping and opening gates; but the very inconvenience would prove a device to insure against reckless and heedless crossing of railway lines by motorists and others who are far too prone to take unnecessary chances.

It is the opinion of the officers of the Touring Club that the railroads in question would welcome any such method of protecting them from damage claims; and it might therefore easily be possible that the railroads would be willing to stand a proportionate share in the comparatively meagre expense of erecting some sort of barrier.

Hoping that you may see your way to take speedy action in this matter, we are, yours very truly,

H. D. BRANDYCE,  
Secretary of the Touring Club of America.

## CORRESPONDENCE WITH THE READER.

**Types of Armatures.**

(1622)—Your article on ignition in the Touring Number was very interesting and instructive. I note mention made of the kinds of magnetos, and that an inductor is made. Being interested in ignition I would like to have you explain to me what the difference is between the various armatures made; that is, the simple, compound and inductor, as mentioned in the story.

INTERESTED READER.

Wilmington, Del., July 23.

With the magneto utilized for ignition purposes, the electricity is obtained by either rotating an armature having windings, or by revolving laminated steel pieces called inductors within a stationary winding, in the magnetic field. The inductor type is shown at Fig. 1, this being the Remy, while the revolving armature carrying windings is depicted at Fig. 2. The latter design may be simple or compound.

The simple design comprises the armature on which is placed a winding of coarse wire, and

**Fig. 1—Remy Inductor Type of Armature Employing a Stationary Winding, the Shaft Carrying the Inductors Rotating.**

by rotating it within the magnetic field electrical energy is obtained, this being collected by brushes, rings, etc., and led to a step-up coil, where it is transformed into a high-tension current, as explained in the ignition article to which reference was made. The current obtained from the rotation of the armature is, therefore, a low-tension, but as it is distributed by the magneto after being transformed into a high-tension, the instrument is termed a high-tension magneto.

The compound armature carries two windings; that is, in addition to the coarse or primary, a winding of fine wire termed the secondary, in that by its incorporation a high-tension current is induced in the instrument itself. This type of magneto is termed the true high-tension to distinguish it from other types. It does not require any coil or transformer. By referring to the illustration at Fig. 2 it will be seen that a con-

denser is also incorporated and that the current is collected from a device termed a collector ring. The simple armature is similarly arranged with the exception that there is but one winding, the primary.

The inductor type, shown at Fig. 1, has a stationary winding of coarse wire rigidly held between the pole pieces to which are fitted the permanent magnets. The only rotating mechanism of this construction is a solid steel shaft upon which are mounted two simple inductors of laminated steel, one on either side of the winding. This particular design is such that at each half-turn of the inductor shaft the direction of flow of the lines of magnetic force through the winding is reversed, producing in the winding two electrical impulses for each complete revolution.

The stationary winding is directly connected through the magnetic circuit breaker with the primary of the step-up transformer coil utilized with the instrument. The circuit is mechanically broken when the current has attained its maximum value. The timing of the spark is accomplished by shifting the circuit breaker around the inductor shaft, to which is secured the circuit breaking cam. With this design collector rings, brushes, etc., are eliminated, and it is held to make for great simplicity and durability, as well as a compact instrument.

**Motor Overheats.**

(1623)—I am troubled with my motor overheating. The ignition is good, valves timed properly and the circulation system is right, as the water appears to circulate. The carbon was scraped out within a few weeks.

K. E. H.

Columbus, Ind., July 22.

If the motor components are in good order as stated, it is possible that a too rich mixture is being utilized. If the cooling system includes a pump, inspect this member and note if a screen is incorporated. Sometimes the screen becomes clogged with dirt, impairing the circulation of the water.

**Whistling of Exhaust.**

(1624)—Lately I am bothered by the exhaust making a whistling noise. If I open the cut-out the noise ceases. What is the cause and how can it be remedied?

SUBSCRIBER.

Cincinnati, O., July 25.

The fact that the whistling noise referred to ceases when the cut-out is opened would indicate trouble with the muffler. It is possible that some of its passages are so obstructed as to produce the effect named. If the muffler has not been cleaned for some time and considerable lubricant

has been used, it would be a good plan to disassemble the silencer and remove all deposits. Sometimes this may be done without removing it from the chassis, by gently tapping the walls with a wooden mallet. The loosened deposits may be displaced by starting the engine.

#### Paraffine Wax in Fuel.

(1625)—Will you please explain what value is obtained by dissolving paraffine wax in gasoline for use in internal combustion motors? What other elements could be used to increase the explosive value and what effects would they have on the engine?  
M. P. O'F.  
Boston, July 25.

The only advantage, if any, in utilizing the material referred to in the fuel, is that of lubrication. In placing the wax in gasoline one is simply putting back that which has been taken out in the distillation of the crude petroleum. In the opinion of the writer the cost of the wax and trouble of using it would not warrant any increased lubricating qualities that might be obtained.

There are several fluids that could be used or mixed with gasoline to increase vaporization and combustion, among which may be named picric acid and sulphuric ether. It is not advisable to experiment with either of these unless one is familiar with their properties and the proportions required.

Camphor has been experimented with abroad to increase the vaporization of gasoline, but those who have tried it report widely varying results. It has been utilized more with benzol, which is slightly more difficult to vaporize than gasoline. In the opinion of the writer it is best to use standard fuel rather than experiment, which may prove costly.

#### Second Hand Magneto.

(1626)—As I am contemplating the fitting of a magneto to my car I would like your opinion as to the advisability of buying a new or second hand one. I have had a second hand Bosch offered me by a chauffeur who says it is in good condition, and the price is very satisfactory.  
ADVICE.  
Boston, July 27.

The old saying in connection with motoring, "The first wear is the best," will apply to the present case. However, the writer knows of second hand magnetos which have run for thousands of miles and have given perfect satisfaction. It would depend upon the condition of the instrument and the care that it has been given. It is suggested that it be taken to the nearest service station for examination by an expert. If pronounced in good condition there is no reason why it should not be used as suggested.

#### Wiring Electric Horn.

(1627)—I purchased an electric horn, ordering it through the mail. It came without any directions as to

fitting. There appears to be only one wire; that is, a twisted wire which is split at the horn end and attached to two posts. The balance of the wire seems to be a single member and has a push button connected in it. I am told that to connect up the horn with the battery, one side of the wire is cut and secured to the battery posts. Does it make any difference which side it is?  
J. W.  
Wood River Junction, R. I., Aug. 1.

The side to be cut would depend to a certain extent upon the installation of the push button and horn. The push button is a switch which closes the circuit, allowing current from the battery to flow to the horn. The latter is provided with two connections, a positive and negative side, for example, and these must be attached to the positive and negative poles of the battery. If two wires were thus fitted and no break or switch provided in one of them, the horn would continue to sound as long as current was supplied by the cells. By depressing the button or closing the switch the electricity is utilized as desired. Normally the switch breaks the circuit. It should be

Fig. 2—Compound Type of Armature Carrying Two Windings, Which Rotate Within the Magnetic Field as a Unit.

remembered that for electricity to flow a path must be provided. This is termed a circuit in that the current is supposed to leave the battery at one terminal, flow through the circuit and return to the other post.

#### Cylinder Missing Explosions.

(1628)—Would you be kind enough to forward information regarding my Overland car? It is a 1910, model 38, which I overhauled recently, but upon completing the work I find that only three cylinders fire. I have had the magneto adjusted, also the carburetor. The spark plugs are in good condition, the cylinders have good compression and everything seems to be in good shape.  
T. P. H., JR.

Elizabeth, N. J., Aug. 2.

It is difficult to state what is the trouble, with only the data submitted, and especially if the components are in proper order as mentioned. If the valves seat properly, open and close at the right time, and the cylinders are getting mixture,

they should fire, provided the spark occurs as it should.

A systematic inspection should reveal the cause of trouble. Check the timing of the valves and note if both the intake and exhaust members close and seat. The compression would indicate faulty seating, but it may be checked by using a gauge. If the timing is correct and the valve springs in order, check up the ignition. Make sure that the spark takes place at the proper instant and that a good flame exists. Test the plugs by laying them on the cylinder and noting the spark.

Examine the wiring, being careful to note if any of the secondary leads come in contact with metal. If the cables are old, it is possible that the high-tension current may penetrate the insulation and ground, rather than bridge the gap of the plug. This sometimes produces a condition similar to the one mentioned, in that in testing the plug out of the valve cap, the cable is moved out of contact with or away from some metal. Running the motor in the dark will invariably enable one to locate the leak, which will be noted by the blue flame.

Water leaking into the combustion chamber would have a tendency to kill the mixture. As previously stated, a systematic search should reveal the trouble. If new gaskets were fitted to the intake pipes or manifolds; that is, between these members and the cylinder, make sure that in making the gasket the centre was cut out. The writer recalls several instances where the failure of a cylinder to fire was due to the workman obstructing the entrance of the mixture by an improperly constructed gasket.

#### **An Exhaust Problem.**

(1629)—I fitted a horn operated by the exhaust of the motor to my machine which has a pressure fuel feed. The horn was attached as directed by the maker, the work being done at a garage. Upon using the car I found that it was difficult to keep my pressure at the necessary point until the car was run at high speeds. Upon removing the horn, the trouble disappeared. Tests proved that it was due to the horn. I was informed that the difficulty was due to back pressure. As the car was overhauled just previous to putting on the horn, and the muffler cleaned, I am at loss to know why the horn should affect the pressure feed. INFORMATION.

New York City, Aug. 6.

The case is the first of its kind that has come to the attention of the writer, who is at loss to account for the trouble unless it be the back pressure mentioned by the repairman. While there would be some back pressure when the signal was being operated, it should not affect the fuel pressure when not in service. It is possible that in attaching the horn the normal flow of the gases was obstructed. It also may have been due to

the check valves of the pressure system not operating properly.

#### **Electric Gearshifts.**

(1630)—Noting an advertisement of a certain make of car, stating that it would have an electric gearshift for 1914, I would like some information on the subject. Is there any advantage in one of these, and why is not the good, old fashioned lever good enough? E. B. T.  
Kansas City, Mo., Aug. 7.

The subject of electrically operated transmissions, also those operated by compressed air and fluids, is discussed and illustrated elsewhere in this issue.

There are several advantages claimed for the systems. In the first place they prevent undesirable stresses to the motor and driving components, as frequently an operator will endeavor to climb a hill on the high when he should shift to a lower gear, or start from a standstill on the second speed. This is often due to his disliking to change speeds. With the electrical device an anticipated change is provided for by pressing a button and the shift is effected by depressing the clutch. With some automatic types the driver has no control of the gears, these changing automatically whenever the load warrants.

The newer type of transmission will appeal to women in that it relieves them from manipulating a lever. And it should be borne in mind that in starting a car from standstill, three lever movements must be made with a three-speed transmission and direct drive on the third. The changing of speeds is not always effected easily by some drivers, resulting in more or less wear of the gears.

Regarding the last question: It may be stated to be a matter of opinion. There are some old time motorists who view the motor starter and left hand drive with disfavor, but their very general adoption is indicative of their popularity and practicability.

#### **ANOTHER WISCONSIN LAW.**

##### **Provides Heavy Penalty for Motorists Who Run Away After Accident.**

It would appear that the Wisconsin legislature was busy with new automobile laws during the recent session. Among the changes is the following:

Any person operating an automobile, motorcycle or other similar motor vehicle who shall injure any person therewith and fail to stop and give assistance, his name and address of the owner of the automobile, motorcycle or other similar vehicle to the person so injured, or to any bystander who shall request such information, shall be guilty of a felony, punishable by a fine of not more than \$1000 or by imprisonment for a period not less than three months nor more than two years.

## IN THE COMMERCIAL VEHICLE FIELD.

### Possibilities of the Motor 'Bus or Char-A-Banc in Competition with Suburban Trolley Service—Features of Eldridge Front Wheel Drive Cart.

ONE of the interesting features of the recent visit of the members of the Institute of Automobile Engineers of Great Britain to this country was the comment made by several of the engineers concerning the possibilities for the motor 'bus, or char-a-banc, as it is more often termed abroad, in the suburban sections of this country. These vehicles are utilized in Great Britain, for example, in lieu of tram, or trolley cars in such sections, and many times, as in London, it has been found that the motor 'bus service is the more satisfactory, judging from the financial returns on the investment.

Among the advantages claimed for the motor 'bus is its ability to traverse any portion of the street, thereby lessening instead of contributing to the traffic congestion. This factor also is of importance when considering the matter of picking up and depositing fares, since it is possible for the 'bus to approach the sidewalk, making it unnecessary for the patron to cross a portion of the highway in reaching the vehicle, as when tracks are laid in the centre of the street, the usual practise with trolley lines.

In Great Britain, many of the hotels catering to tourists in the sections noted for their historic or scenic interest, have become enthusiastic over the char-a-banc. A 30 horsepower, 20-passenger machine of the torpedo type, made by the Lacre Motor Car Company, Letchworth, England, is shown herewith, and suggests the design which is meeting with decided favor in this particular field.

Another illustration presents an Albion char-a-banc of the pay-as-you-enter type, this being made by the Albion Motor Car Company, Scotstoun, Glasgow, Scotland, for service in New Zealand. The machine is typical of those utilized

in several of the British colonies and in other sections, where it has not been found advisable to construct railroad lines. The roof and side curtains are arranged so as to provide for all weather conditions, and the interior is designed to accommodate 25 passengers.

A number of motor 'bus lines have been established in this country within the past few months. White, Kissel-Kar, Federal and several other chassis are being utilized for this purpose, and with results which would seem to justify the enthusiasm of the British engineers. An accompanying illustration presents a two-ton Atterbury chassis fitted with a pay-as-you-enter 'bus body, designed to seat 25 passengers. This car

**Lacre 20-Passenger, Torpedo Type Char-A-Banc for Use in Great Britain.**

has only recently been placed in service between Auburn and Moravia, N. Y., a distance of 23 miles, and the fare for the trip is 50 cents.

It will be noted that the Atterbury car, which may be regarded as more or less typical of American design in this respect, does not differ materially from the New Zealand machine shown herewith. The single entrance at the front facilitates the plan of collecting fares as the passengers enter the vehicle and makes it possible for the driver to look after this feature as well.

As an indication of the possibilities with the motor 'bus, the experience of London, England, is of interest. Since 1900 the number of machines in service has increased from 1049 cars to 2527,

**Pay-As-You-Enter 'Bus on Two-Ton Atterbury Chassis for Suburban Service in America.**

and the street-miles traversed from 114.8 to 336.6. The figures disclose an approximate average of 10 vehicles in service a mile of route worked, while similar data for the London City Council electric street cars show an average of 11.5 to a street-mile served. The average speed of the electric car is held to be at least two miles an hour less than that of a motor 'bus. This, of course, is in city service, and opens a field which has not been seriously considered in America, except in a very few instances.

### **ELDRIDGE COAL CART.**

#### **Electric Front Wheel Drive Wagon Designed to Supplant Single-Horse Outfit.**

Exhibited for the first time in connection with the 1913 Boston show, the electric front wheel drive wagon, made by the Eldridge Manufacturing Company, 178 Devonshire street, Boston, has met with decided success in that city. As will be seen by the accompanying illustration, the vehicle is designed to supplant the single-horse equipment in the handling of coal and similar commodities. It is stated that the type was originated by the chief engineer of the

Third Avenue Railway Company, New York City, for hauling ashes, but the construction has been improved somewhat by the Eldridge concern.

The chassis frame is a steel angle that is "necked" from the centre cross section forward, the angle being curved to supply the usual front

cross member. The frame is mounted on a solid axle. The front end carries a heavy cast steel plate, in which is cast a base for the fork that is supported by the front wheel. This plate is bolted to the frame. The driving wheel is mounted in practically the same manner as the front wheel of a bicycle, and its axle is fixed in the ends of the fork.

The motor is installed on this front wheel axle, and is approximately three horsepower, being constructed to sustain about 300 per cent. overload temporarily. The ends of the armature shaft carry pinions that mesh with the racks in the outer edges of the discs that form the wheel, and the reduction is 24:1. On either side of the wheel are brake drums with external contracting brakes operated by a pedal and connected with cable so that the braking influence is equalized.

The fork above the wheel has a heavy shaft

**Albion Pay-As-You-Enter Type of Char-A-Banc Designed for New Zealand Service.**

**Eldridge Electric Front Wheel Driven Cart.**

that exactly fits the base bracket of the plate, and a collar and a large nut that threads onto the bracket retain the shaft. On the upper end of the fork shaft is mounted the 22-inch hand wheel, and while there is no bearing the shaft can be turned easily in the plate.

The battery cradle is below the main frame, back of the front wheel and forward of the rear axle. This cradle is loaded from the side, the sides being removable. It is supported at the corners by heavy lugs that are carried on four guides, with helical springs above and below the lugs to protect it against road shocks and stresses. The controller is mounted upright at the left side of the frame, this being of the street car type and it is supplied with a removable lever.

Directly over the rear axle and attached to the frame are the brackets that carry the body. The body is of heavy sheet metal and is supported by a bar, the ends of which form trunnions that turn in the brackets. The trunnions are carried on helical springs that are compressed when the body is loaded. The floor slopes forward from the rear to the

centre, and when dumped this section is vertical, insuring the complete discharge of the contents.

### A NOTABLE DEMONSTRATION.

#### Interesting Development of the Delivery System of Adams Express Company.

A short time ago, in connection with a motor truck parade in Newark, N. J., the Adams Express Company of that city took occasion to demonstrate the development of its delivery system in a thoroughly interesting manner. An accompanying illustration suggests the exhibit, and it will be noted that it indicates the growth of the system from the beginning until the present.

In front of the procession was a man on foot carrying a carpet bag, a replica of that used by Alvin Adams, when he began to travel as a messenger from Providence, R. I., to New York City in 1840. Mr. Adams went by train and steamer, carrying parcels for persons who at that time desired a quick delivery. As the business extended it became necessary to retire the carpet bag and its immediate successor was the pushcart. Later horses and wagons were utilized, until the advent of the motor vehicle.

Relative to the last named equipment, it may be stated that the first experiment made by the Adams Express Company was in Jersey City, N. J., about 15 years ago. These were steam vehicles and were not found satisfactory. In 1903 the company again took up the automobile in Buffalo and Rochester, and with better success. At present the company has about 500 automobiles, that shown in the picture being a Lansden electric, made by the Lansden Company, formerly of Newark, but now of Allentown, Penn.

**Exhibit Intended to Demonstrate Development of Adams Express Delivery System.**

## PROTECTING THE HIGH-TENSION CABLES.

### Various Methods Employed to Eliminate the Effect of Mutual Induction---How Water and Dirt Form a Temporary Conductor.

THE owner of the modern automobile, whose experience is limited to the more recent types of internal combustion engines, does not

Illustrating Packard Method of Supporting High-Tension Cables and Numbering of Leads to Facilitate Location of Troubles.

fully appreciate the perfected ignition systems now in service. Instead of a tangled mess of wires, inviting trouble in the shape of short circuits, bothersome coils and exhaustible batteries, are compact, durable, efficient magnetos and simple wiring methods. And in place of yards of primary and secondary wires are a few short leads. Improved terminals and water proof instruments have reduced the care of the present ignition system to a minimum, the magneto requiring no other attention than an occasional oiling.

As the high-tension cables carrying the current get severe service, it is well to give these members the slight attention they require. They should not be exposed to the deteriorating action of heat or oil, either of which will in time lay the foundation for trouble in a mysterious miss or a loss of motor efficiency. It should be borne in mind that the wires carrying the high-tension current are subject to a pulsating current of high voltage, but small capacity; that is, the current is small. The uniform carrying capacity of this cable is between No. 14 and 15 B & S gauge. The conducting material is sub-divided into finer wires for the sake of flexibility as well as for mechanical strength. High-tension wires are subject to a capacity effect which is inherent in all high-tension apparatus that carries a pulsating or varying current, such as an alternating one.

This capacity effect is sometimes apparent, especially when the cables are covered with dirt

and water, forming a temporary conductor of greater or less conductivity. It is pointed out by the Packard Electric Company, Warren, O., manufacturer of ignition cable, that this is sometimes mistaken for a break down of the insulation, which is denoted in the dark when a light blue or tiny spark can be seen to jump from the wire to metal parts of the chassis, or to ground.

The company holds that this phenomenon does not indicate that the insulation has broken down or is even weak, for this so-called static effect is apparent in all insulation wires, but is magnified or intensified when the outer insulation is covered with water or dirt. The disagreeable effect of such phenomenon is demonstrated by the fact that a person can experience a severe shock by touching the high-tension cables when they are wet, and if they are run sufficiently close to iron it is possible that enough heat will be generated at a single point where this static current is jumping to the metal, to heat the cable at that point and eventually burn it through until there is an actual break down from the conductor to the iron frame. Under the last named condition a new wire will be required.

There is another effect to be considered, namely, that of mutual induction. If two wires are parallel to each other and close enough, a supposedly dead conductor will be caused to have generated in itself from the effect of the live conductor in proximity to it, a sufficient voltage to jump across the spark gap of the plug, thereby

The Lenox Employs a Tube Clipped to the Water Manifold and the Reo a Vertical Tube Between the Cylinders—Moyer Design is Also Shown.

producing two explosions at the same time, one of which is, of course, out of time. The effect of the static current on the outside can be reduced

The Inter-State Has Dual Tubes Well Away from the Cylinders and the Lozier a Single Tube.

by sufficiently enlarging the diameter, but this is again limited to the size of the terminals provided on the magneto, coils, etc., and the cost of the cable is also a factor.

For example: Increasing the diameter by two; that is, doubling it, would make the cable contain 267 per cent. more insulating material and would only decrease the capacity effect 36 per cent. The effect of mutual induction can be reduced by separating the cables so that they will be about an inch apart.

It has been held by some that a high-tension cable will leak in service after becoming dry. The Packard Electrical Company states that while it may be true of ordinary cable, it does not apply to a high grade wire. Relative to the usual breakdown tests of a high-tension cable it may be stated that it should be able to withstand successfully at least 30,000 volts, or a voltage corresponding to that which will jump a three-inch gap from sharp points.

The car manufacturer who installs the magneto and wires the system, has given considerable thought to the retention of the high-tension leads and accompanying illustrations present a number of conventional methods. That the maker considers the wiring an important factor will be noted by the utilization of devices which add to the cost of production, and in several instances special carriers have been designed. In practically all of the installations coming to the attention of the writer, the wires are so supported that opportunity for mutual induction is reduced to a minimum.

In several instances the wiring has been greatly simplified

by utilizing a numbered carrier; for example, the cable connecting the No. 3 terminal of the distributor of the magneto and the plug of the third cylinder is plainly marked. The Packard 38 utilizes this arrangement, as will be noted by an accompanying illustration, which depicts the special carrier and shows the leads entering a tube. Another Packard model employs a form of numbered block. With both, it is possible for the owner to trace a faulty connection very easily.

The Knox and Hudson employ a tube for carrying the high-tension cables, the former utilizing it also for the leads from the distributor of the battery system. These wires are led from a central opening of the tube, while those connecting with the spark plugs have individual openings. The Hudson carries its wires from the dash through a rubber hood, thence to a straight tube having an end curving downward and ending in proximity to the distributor device of the Delco system employed on this make.

The carriers are not always constructed of non-conductive material, as is noted in the case of the Alco and the Cadillac. The former employs three pipes, the inside member carrying the leads from the magneto, another the wires from the distributor and the third for the primary members. The Pierce-Arrow favors an aluminum carrier, having a flat top, and provision is made for two sets of high-tension cables, two sets of plugs being fitted to the 6-48. The Lozier also affects metal, utilizing a brass tube retained by studs to the intake manifold, and having hard rubber inserts to protect short circuits by possible chafing of the insulation. The Pierce-Arrow adopts similar precautions against opportunity for short circuits.

The dual sets of high-tension wires of the Inter-State motor are carried in metal tubes, one

Showing Differing Installations of High-Tension Cables, Including Those Utilized on the Knox, Hudson, Pierce-Arrow and Alco.

above the other, the container being fitted with suitable insulation where the leads leave the tubes. The latter are carried on special brackets sufficiently spaced from the top of the cylinders. The Fiat carries its wires in a long brass tube bolted to the cylinder studs, and the White also affects the tube design. The last named car encloses its magneto as well, using a leather cover, a practise noted of a large number of cars.

The maker of the Peerless, which for several seasons has employed a hard rubber cable carrier, continues the practise, and the material of the design shown in an accompanying illustration is in the form of a T, the lower portion of which extends very close to the source of current supply.

A number of makes utilize the outlet water manifold of the motor to support the cable car-

riants of the cables but the possibility of short circuits.

Ebony as a support for the cables is noted on one prominent make of car, while others employ metal brackets, fitting the wires snugly to prevent vibration chafing the insulation. There appears to be a wide diversity of opinion as to the proper protection of the high-tension cables, but it may be said that the majority of the manufacturers so attach the leads that they are not subjected to heat, dirt or oils. The practise of some to extend the protective material in proximity to the magneto, thereby preventing deterioration through the action of grease, is noticeable.

There are a few exceptions to the rule, however, and the writer recalls three makes, one a high grade car, on which the wires are strung loosely and without any attempt to provide sup-

Indicating That There Is a Difference of Opinion with Makers as to the Proper Method of Retaining and Protecting the Leads Conveying the High-Tension Current to the Spark Plugs.

rier, among which is the Overland. The design referred to is a split clamp like device of fibre, and it will be noted that the wires are well spaced from one another. Just above the magneto the leads are maintained in a separated condition by another similar holder. The Metz employs a construction very similar to that of the Overland. The leads of the Marmon Six are retained in a bracket between the cylinder units, either end of the carrier being attached to the top of the cylinders. A similar method is noted in the Reo with the exception that the bracket retains a tube passing vertically through it and extending well above the top of the cylinders.

The Lenox carries its wires compactly and with a minimum length. Clipped to the top of the outlet water manifold is a copper tube and the use of rubber inserts not only prevents move-

ports. The general tendency of the car manufacturer to protect the carriers of the high-voltage current and the perfection of the magneto, are responsible for the lack of ignition troubles which existed with motors in the past.

The creditors of the Milwaukee Automobile Dealers' Association, including the racing drivers who won prize money, have received a communication from J. H. Spence, a Milwaukee lawyer, offering a settlement on the basis of about 20 cents on the dollar. Mr. Spence makes it plain that he does not represent the association, but a number of individuals who have contributed a fund for this purpose. The total indebtedness, arising from the running of the Grand Prize and Vanderbilt Cup races of last October, is said to be about \$38,500.

## KING FEATURES CANTILEVER SPRING.

**A** NNOUCEMENT is made of a moderately priced car by the King Motor Car Company, Detroit, the new design, which will be known as the model B, being constructed in one chassis, to which will be fitted five and two-passenger bodies. The new machine is the creation of Charles B. King, who has been prominently identified with the automobile industry for a number of years, and who claims to have designed the first four-cylinder motor cast en bloc in this country. Incorporated in the new chassis are features usually confined to high priced cars, and although the selling price is an attractive one, the best of material and workmanship is incorporated. All details have been worked out carefully by the designer and embody principles indorsed by sound engineering practise. The King car is designed to give maximum service with a minimum cost of upkeep, and the equipment is very complete, including electric lighting and those conveniences making for ease of operation.

The most striking feature of the new chassis is the employment of a cantilever spring designed and patented by Mr. King. It is a modification of the Lanchester spring, utilized on a well known make of English car, and it is held by the maker that it not only eliminates side swing, but is most flexible, providing easy riding qualities, as well as dispensing with shock absorbers or similar devices.

The motor is a four-cylinder unit, L head type, with the cylinders cast en bloc, having a bore of 3.875 inches and stroke of five, which places it in the long stroke class. The company claims that the horsepower production is 30-35, which is ample and in proportion to the weight of the car. The crankshaft is 1.8125 inches in diameter, and has three bearings, these being 3.125, three and four inches for the front, centre and rear members respectively. The enclosed valves have a diameter of .8125 inch and are actuated by roller pushrods, making for noiseless operation. The cylinders are bolted to an aluminum alloy crankcase, the lower half of which serves as the oil reservoir. The camshaft and connecting rod bearings are liberal in size, the latter being 2.625 inches. All components of the power plant are easily accessible.

Carburetion is by the latest type Stromberg, very accessible, and feed is by gravity from the fuel container located under the front seat. Dual ignition on one set of plugs is provided by a Briggs magneto located on the right side of the motor and driven by enclosed gears.

Lubrication is a combined force feed and splash. The oil pump, which is driven by bevel gears from the camshaft, is located in the base at the left hand side of the motor. It draws the lubricant from the reservoir and forces it through a steel tube in the crankcase to pockets over each crankshaft bearing. Holes are drilled in the caps of the latter and the bearings are flooded with lubricant. The surplus then flows to pockets into which the scoops on the connecting rods dip, splashing the oil to all working parts. Each oil compartment has a hole for maintaining the proper height of the lubricant under all condi-

**New Model B King, a Five-Passenger Touring Car with Attractive Lines and Full Equipment.**

tions. The pump is surrounded by a strainer and on the right side of the motor is fitted a gauge having a float to indicate the supply on hand. Cooling is by thermo-syphon, and the intake and exhaust pipes are liberal in size. A six-bladed, pressed steel, adjustable fan, assists in maintaining the proper temperature of the cooling fluid.

The clutch is a multiple disc, comprising six driving discs faced with Raybestos and six driven steel plates. The 12 discs operate in a small amount of lubricant carried in the housing to insure proper lubrication of the pressure plate bearing and clutch shaft mechanism. The clutch is enclosed in an extension of the crankcase and it is held the design is such that thrusts on motor bearings and transmission are eliminated. The spring tension of the clutch is taken by a large ball bearing in the transmission case. Being fully

**King Model B Two-Passenger Roadster in Which Provision Is Made for Carrying Luggage, Etc., Under the Rear Deck.**

enclosed, the entrance of foreign elements is prevented.

A selective, sliding gear transmission, providing three forward speeds and a reverse, is utilized, and the gears are extra large, 6-8 pitch and .875-inch face. The large shafts are of a high grade material and rotate in Hyatt high duty roller bearings. Drive from the gearset to the rear axle is through a Spicer universal joint mounted at the rear of the transmission by a shaft which is enclosed in a substantial and well designed torque tube. It is held that with the car fully loaded the drive is such that a minimum loss of power is experienced.

The rear axle is of the full floating type and the design and construction are such as to provide a large factor of safety. The driving gears are very heavy and of coarse pitch, insuring a quiet running axle. A large inspection plate on the top of the differential permits of easy inspection and adjustment of the components. The differential and rear wheel bearings are Hyatt roller. The front axle is of the I beam section type, a drop forging.

The floating cantilever spring referred to is pivotally supported near its centre on a sturdy bracket secured to the frame. The front end of the spring is carried in a slotted bracket or hanger, the latter being riveted to the frame, the construction permitting of end-wise movement, but no side play. The rear end is secured by plates and bolts to a sleeve which pivots on the axle tube. Reverse leaves are incorporated in the springs, each of the latter having one leaf on the underside at the centre

and rear end. These compensate recoil without sacrificing resiliency, eliminate side sway and provide ample road clearance. The front springs are semi-elliptic. The maker of the King lays great emphasis on the spring suspension, maintaining that shock absorbers are not necessary and that the cantilever construction provides maximum comfort over the roughest of roads.

Two sets of brakes are fitted, the service member being of the external contracting type and operated by the conventional pedal. The emergency brakes are internal contracting, actuated by cams, and operated by the usual lever. The drums are 14 inches in diameter, face 2.5, providing ample braking surface. The frame is of pressed steel, having a four-inch section and with side rails .15625 inch thick. No sub-frame is utilized and the usual kick-up at the rear makes for a low centre of gravity as well as stability.

The wheels are of the artillery type, of carefully selected material, and demountable rims are fitted. The tire size all around is 33 by four inches, Goodyear No-Rim-Cut tires being utilized. The wheelbase is 112 inches with tread standard, 56, although an option is given of 60 inches. The steering gear is a Gemmer, of the irreversible worm and gear type, and provision is made for adjustment. The steering column is set at a comfortable angle and is surmounted by an 18-inch wheel. The spark and gas levers are mounted on a sector. The driver is located at the left with the gearshift and emergency brake levers in the centre. The four movements of the

**Top View of King Chassis to Which Two Types of Bodies Are Fitted—Note the Accessibility and Compactness of Components and Sturdy Construction.**

former are very short and the control units are located convenient to the operator. The conventional accelerator is included, as well.

**Illustrating the Suspension of the King Patented Floating Cantilever Spring, a Feature of the New Model.**

The standard electric lighting equipment includes an 80 ampere-hour storage battery, two 11-inch headlights, two side lamps fitted in the dash and a tail light with a license bracket. The Ward Leonard combined electric motor starter and lighting dynamo is listed as extra. This system was fully described and illustrated in these columns.

Two types of bodies are standard, a two-passenger with sloping deck and luggage carrying compartment beneath the deck, and a five-passenger with gracefully rounded back and torpedo shroud. Both bodies have attractive lines and the upholstery is high grade in every particular. The seats are wide and are tilted slightly. The rear seat of the touring car is 48 inches wide and will accommodate three persons comfortably. The leg room, both in front and in the tonneau, is ample. Provision is made for easy entrance and exit to the bodies, the door on the touring design being 20 inches in width, while the front members of both types measure 19. Entrance is possible on either side of the body. The finish is a dark, rich blue, and black and enamel trimmings are utilized throughout. The running boards are noticeable for the absence of fittings, there being no battery or tool boxes to detract from the appearance of the car. The battery is located under the floorboard of the tonneau and is easily accessible for replenishing the supply of water which the cells require for proper maintenance.

The equipment is very complete. The rain vision ventilating windshield, with black and nickel trimmings, has a specially designed channel steel frame, supported by a bracket built into the cowl of the dash, and pivoted near the top, at which point it may be fastened in either a forward or backward position. This eliminates stay

rods, etc. The balance of the equipment includes a silk mohair top with quick detachable curtains, electric horn, tire irons, one extra rim, pump, jack, tools and tire repair kit. The Stewart-Warner speedometer is listed as extra. The King model B will appeal to those who desire a high grade moderately priced car, having ample power to meet requirements under all conditions of service and capable of being maintained at a minimum cost of upkeep.

### HUPMOBILE WINS ABROAD.

**Only American Car Entered in Russian Grand Prix Takes Award.**

Following the winning of the Anderson trophy and Minneapolis Daily News cup by two Hupmobiles in the recent Glidden tour, comes the announcement from St. Petersburg that a 20 horsepower Hupmobile runabout, made by the Hupp Motor Car Company, Detroit, was victor in the first Grand Prix of Russia. This event is an endurance contest somewhat similar to the American Glidden, but the conditions are said to be more severe.

The Hupmobile was the only American car that participated and was taken from the crate in which it was shipped from the factory. As win-

**The Rear Axle Is Designed with a Large Factor of Safety and Bearings and Other Components Are Very Accessible.**

ner the Hupmobile dealer in Russia received a handsome loving cup, presented by the president of the St. Petersburg Automobile Club.

### GOLDEN GLOW LAMPS.

#### Esterline Electric Units Held to Possess Non-Dazzling Qualities.

Announcement is made of new designs of Golden Glow electric lamps, made by the Esterline Company, Indianapolis, Ind., the new types including a dashlight, head, tail and side members, and a motorcycle lamp. The lights produced by this concern are so named because of the peculiar color of their reflected rays, which are claimed to possess superior fog and dust penetrating qualities. The reflector is made of glass, the material being molded in the form of a parabola, ground true and polished on both sides. It is then silvered by a special process to form the mirror. Over the silver coating is a layer of

The searchlight design is being constructed in two sizes at present, the larger being 15.5 inches in diameter and capable of utilizing a 100 candlepower bulb. The smaller is 11.25 inches in diameter and a 25 candlepower lamp is fitted. Both designs are provided with suitable trunnions and brackets for mounting on a flat surface, or on the steering post of a car. Provision is made for rapidly focussing the light by means of a thumb screw and the lamp can be rotated through a wide range in every direction, or locked in any desired position. The design is adaptable for motor boats, yachts, municipal service vehicles, etc. The all-round ruby tail light is another innovation, being spherical in shape and constructed entirely of red ruby glass with the exception of a plano-convex lens of clear glass. It differs from the conventional red rear signal in that the ruby color is discernible from all directions except the front of the machine to which it is attached. A feature of the design is that the name of the car or the owner's monogram may be etched on the globe and may be discernible at night as well as in the daytime. Several designs are presented in the accompanying illustration.

Illustrating Some of the Latest Designs of Golden Glow Electric Lamps, Including Head, Side, Dash and Tail Members.

copper, electrically deposited, a construction which provides a rich golden yellow light, penetrating, but extremely mellow. It is also held that the rays are not tiring to the eyes and do not blind or dazzle pedestrians or vehicles approaching in an opposite direction.

The Golden Glow reflectors are made in seven sizes, these ranging from five to 12 inches in diameter, and are placed in specially designed metal housings. The method of retention is such as to prevent the entrance of foreign elements. The front glass is held in position by means of a number of phosphor bronze springs, and although rigidly secured, is not affected by expansion or contraction due to changes of temperature. Ventilating means also are incorporated. All designs are equipped with a focussing device, this being operated from the exterior of the lamp.

The Esterline company was formerly located at Lafayette, Ind., moving recently to Indianapolis, Ind., as the result of Carl G. Fisher and James A. Allison of the Prest-O-Lite company having become stockholders. The company is occupying a three-story building of reinforced concrete which will be employed for the production of a large variety of Golden Glow lamps.

In order to facilitate deliveries Gray & Davis, Boston, maker of electric motor starting apparatus, has purchased the Sprague-Waldo lamp plant at 19-23 Harper avenue, Detroit, and will take possession Sept. 1. This will give the Boston firm four large factories, two in Boston, one in Amesbury, Mass., which has been enlarged one-third, and the new plant at Detroit.

William M. Hodgkin of Boston reports that he has driven his KisselKar machine, made by the Kissel Motor Car Company, Hartford, Wis., which he purchased June 5, 2550 miles on an expenditure of nine cents, exclusive of fuel. The car has averaged 13 miles to a gallon of gasoline.

## MOTORING SITUATION IN BAR HARBOR.

**M**OTORISTS have been much interested in the outcome of the attempt to open Bar Harbor, Me., to automobile traffic, and some decided misunderstandings have resulted because of lack of knowledge of the situation. Mount Desert island is divided into townships, and the statute of 1909 excluded automobiles from the towns of Eden, Mount Desert, Tremont and Southwest Harbor. Bar Harbor is in the town of Eden. Section 1 of the above law reads as follows:

No automobile or motor vehicle shall be set up, used, driven or operated in or on any highway, townway, or public street within any of the towns of Eden, Mount Desert, Tremont and Southwest Harbor, on the island of Mount Desert, in the county of Hancock, State of Maine.

This act was amended in 1911 so that it read as follows:

Section 1—No automobile or motor vehicle shall be set up, used, driven or operated in or on any highway, townway, or public street, within the towns of Eden and Mount Desert, on the island of Mount Desert, in the county of Hancock, State of Maine.

Section 2—The provisions of this act or any previous act shall not apply to a certain public highway leading directly from said town of Tremont to the town of Trenton, which is defined as follows: Beginning on the highway or road at the Center at the town line between the said towns of Tremont and Mount Desert, thence following the main travelled highway or road in a northerly direction in said Mount Desert to Pretty Marsh Corner, thence in a general northwesterly direction following the main travelled highway or road in said Mount Desert to Smith's Corner, so-called, thence northerly following the main travelled highway or road in said Mount Desert to the Eden town line near High Head, thence northerly over the main travelled highway or road in Eden through Indian Point, so-called, to Bunker's Corner, at Town Hill, thence northerly following the main travelled highway or road in Eden through the Cousens District, so-called, to the town of Trenton; said highway or road to be used for ingress or egress to and from the town of Tremont on said island of Mount Desert to said town of Trenton.

The legislature of 1913 passed an emergency act repealing that portion of the act of 1911, and all other acts, prohibiting the use of automobiles in the town of Eden, and declaring void all by-laws and ordinances of the town prohibiting or restricting the use of automobiles, but including the following section 2:

The town of Eden, in the county of Hancock, and State of Maine, may, at any legal meeting, called by a warrant containing an article for the purpose, close to the use of automobiles and motor vehicles the following townways and highways within its limits: The Norway Drive, so-called, beginning at Liscomb's Corner, so-called, and extending to the Eagle Lake road, near the Young District schoolhouse; the Breakneck Drive between Hulls Cove and the Eagle Lake road; the Ocean Drive, beginning at the bridge at the foot of the hill near the Satterlee property, at Great Head, and extending to the driveway of the Country Club, near Otter Cliffs. Any townway or highway so closed shall be marked at the entrance thereof by signboards in large letters, "No automobiles allowed on this road."

The legislature of 1913 also amended the law as applying to the town of Mount Desert, so that

the section in question read as follows:

The town of Mount Desert, in the county of Hancock, at any legal meeting of the voters thereof, may adopt by-laws prohibiting the use of automobiles on any or all of the highways or townways in said town which said by-law may declare to be for any reason dangerous or unsuitable for their use. Any section of road so closed shall be marked at the entrance thereof by signboards in large letters, "No automobiles allowed on this road."

This amended act was expressly stated not to affect, in any manner, any part of the highway mentioned and described in the act of 1911, referred to above, but it also included the following section 4:

Subject to the provisions of the state constitution hereto applicable, this act shall take effect 10 days after it shall be accepted by said town of Mount Desert at any legal meeting called by a warrant containing an article for the purpose.

At a special town meeting held July 25, the voters of Mount Desert, by a vote of 292 to 18, decided not to accept the act. The town of Mount Desert includes Northeast Harbor and Seal Harbor, two of the most exclusive summer colonies on the island. Among the summer residents who were present and advocated the passage of the vote, were John D. Rockefeller, Jr., and Dr. Charles Eliot, the latter president emeritus of Harvard. Several other summer people expressed their opinion on the matter, all declaring that at present the summer colonies in the town of Mount Desert were practically the only places in the country where it was possible to get away from automobiles and that they desired such conditions to continue.

The business men of Bar Harbor, who have been experiencing the advantages of admitting automobiles to that resort, after a long delay, are not inclined to the opinions which appear to have had weight in Mount Desert. Fearing that the impression might be gathered that automobiles were not welcome in Bar Harbor, the Business Men's Association of the town of Eden has prepared a detailed statement of the situation for general circulation to all hotels and automobile clubs throughout the country.

At a meeting of the officials of Prince Edward Island recently, heed was given to a petition signed by 1700 citizens, and it was decided to permit motor cars to operate in Charlottetown city and royalty, on Monday, Wednesday and Thursday, each week. Four touring cars were immediately ordered as the result of the decision.

## THE REPAIR SHOP AND GARAGE.

### Suggestion for a Fan Attachment, Providing Two Speeds and Neutral, and Controlled from the Seat--Jig for Slotting Pinions--Hints and Tips.

**I**T IS customary to remove the fan belt in extreme cold weather and to replace it when needed, the change being made in accordance with the judgment of the operator. Many times the temperature will rise rapidly or fall suddenly in the winter, resulting in the motor overheating or becoming too cool to obtain maximum efficiency from the fuel. A suggestion for a two-speed fan appeared recently in *The Commercial Motor*, an English motoring print, which is reproduced, and although primarily intended for commercial cars, could be adapted to pleasure vehicles.

An accompanying sketch shows the device with the components lettered. It comprises, in addition to the details set forth, a connection from the lever member to the dash whereby the driver

An Epleycle Gear for Fan, Permitting Two Speeds as Well as a Neutral Position.

can utilize either of the two speeds or render the fan inoperative. The materials employed were obtained from the scrap heap with one exception, the rubber rollers.

The device comprises a casing of about 4.5 inches in diameter, which was constructed of a four-inch pipe having the threads turned off. This is free to revolve independently from the shaft. Inside of the casing is a perfectly plain wheel which is keyed to the shaft and is 2.5 inches in diameter, also four rubber rollers which are mounted on pins protruding from the disc member. The last named carries the pulley, from which power is transmitted to the fan, and is so mounted that it is free to turn and slide through a limited distance along the shaft.

The rubber rollers were made from three-gallon ammonia flask stoppers. These are of slightly greater diameter than the difference between the radii of the inside of the case and the wheel. In assembling it is necessary to force them into position and by this means they remain under compression, which prevents slipping. Small holes are burned or punched through the rollers, and brass tubing of suitable diameter and length is forced into position to act as bearings.

On the plate of the disc and on the side of the wheel are screws with the heads protruding, so that when the disc is shifted toward the casing the heads interfere, and the pulley wheel is driven at the same speed as the shaft. The shifting of the disc is accomplished by means of the lever which protrudes through the floorboard. Pressure on the brake member, which can be located in either an "in" or "out" position, causes the casing to come to a standstill, and the disc being moved toward the timing gear casing as far as possible, the pulley wheel is caused to revolve at approximately half the speed of the shaft. When the brake is released and the improvised dog clutch is disengaged, the casing revolves in the opposite direction to the shaft, due to the rollers remaining idle. This obtains the two speeds referred to. The rollers are the most delicate part of the device. When replacement becomes advisable, however, it is only necessary to loosen the collar member, which serves to retain the casing on the shaft.

### HARDENING SMALL DRILLS.

Hardening and tempering small taps and drills requires considerable care and experience if perfect work be obtained. When undertaking the work the drills or taps are held with the spiral or thread immersed in lead which has been brought to the melting point in an iron or earthenware crucible. Pieces of very small diameter should be left in the molten metal for about 60 seconds. They should then be withdrawn and plunged into cold water. If the bath be of the correct temperature no lead will adhere to the work when they are removed. After chilling the tools should be cleaned and tempered.

The most convenient method is to lay them on a sheet of old iron held over a charcoal and

gas fire. The tray should be rocked a little during the process in order that the pieces may be heated uniformly. When they attain a dark straw or gold color they should be again plunged in water. It is held that by the above treatment the degree of heat is strictly limited, and it is impossible to burn the edges as with an open fire.

#### SECURING BRASS PIPE IN VISE.

In replacing a broken brass pipe with new, and when threads have to be cut, the walls will be crushed unless one utilizes caution. A device for securing the work may be made by taking two pieces of wood and boring a hole in the line where they are joined together. The pipe is then placed between the jaws in the half-round holes and clamped tightly in the vise. A little powdered resin applied to the wooden members will prevent slipping.

#### GRINDING ALUMINUM.

Grinding aluminum castings on emery wheels spoils the latter as the soft metal clogs up the abrasive material, impairing its cutting efficiency. To avoid this, a piece of paraffine wax should be held against the wheel. It will not reduce the efficiency in any way and can be easily removed by the application of heat.

#### CASE HARDENING HINT.

When case hardening a wheel or other component of a piece of work and it is desired to leave one section soft for machining, it can be accomplished by the following method: Before placing the work in the furnace to be carbonized, the part which it is desired shall remain soft, should be covered with a layer of old fire clay. When removing the part after the heating process, the fire clay should not be removed, but it should be allowed to remain in position until the work has become cool.

#### JIG FOR KEYWAY CUTTING.

A jig designed for holding gear pinions when cutting keyways, and which can be changed to cut one, two, three, four or any desired number of slots which may be required in the pinion, is shown in an accompanying illustration. An elevation view is presented at the right. The view at the left is of the T slotted base, which is bolted on the machine table of a slotting or keyway cutting machine.

The base is bored out in the centre, and a second jig is machined to drop into this bored-out section. The upper piece has three bosses cast onto it, through which set screws are taken serving to hold the pinion. Between the end of the set screws and the pinion, however, are three hardened steel pieces which are machined to the outside radius of the pinion which is being cut. Equidistant and tapered slots are cut in any required number around the holder, which has the cast lugs on it, and a spring controlled register pin runs through a boss cast on the main base. The pinion is held as shown by the dotted line. The spring controlled key drops into one of the slots and the keyway is cut, and any other slots may be brought into register for the purpose of cutting a second, third, fourth keyway, etc.

When this jig is made up, and suitable distance pieces have been made, it will be found a

A Gear Pinion Jig for Keyway Cutting Which May Be Utilized for Any Desired Number of Slots.

great convenience where a large number of pinions are continually being slotted, as the tool can quickly be adjusted to different sized wheels. The various distance pieces and blocks need not be made up at first. They will accumulate as different work is done, until a complete set is obtained.

A big conference of Velie dealers, representing all sections of the country, opened in a white city of 200 tents, each holding two men, at the plant of the Velie Motor Vehicle Company, Moline, Ill., July 21. Besides the tents for sleeping quarters there are two larger tents, one being utilized as a dining hall and the other for the convention proper. Prominent accessory manufacturers also were in attendance. The object of the conference was to acquaint the dealers with the features of the new Velie line, consisting of a light six and two four-cylinder models.

## FEATURES OF SMITH FOUR-JET CARBURETOR.

**A**N ENGLISH carburetor presenting interesting features in that four jets are incorporated, each having its own choke tube, is the Smith, the product of S. Smith & Son, London, England. Tests of the vaporizer fitted to pleasure and commercial vehicles resulted in fuel economy as well as motor efficiency.

As will be noted by reference to the sectional view presented at A in an accompanying illustration, the design makes for simplicity and accessibility of components. It is stated that a new set of jets may be fitted in two minutes. The first jet is of larger bore than the others and is utilized for starting, the second, third and fourth

minute, with a suction equal to a six-inch head of gasoline, this condition being automatically maintained on each jet when in operation, irrespective of the speed of the motor. The adjustment is effected by changing the jets until the correct mixture for all speeds is obtained. By means of a rotary sleeve valve operated by a lever, the driver can alter the mixture from the seat to suit varying atmospheric conditions. As will be noted, the float chamber is of conventional design. The variation in the sizes of the jets is due to the fact that as the speed and power of the engine increase, the strength of the mixture should decrease in a uniform manner. It is held that the Smith can be fitted easily to various makes of motors. There are six different connections for heating by hot water.

### COMING EVENTS.

**Smith Four-Jet Carburetor. Having an Automatic Controlling Valve: A, Sectional View; B and C, Choke Tube and Combination Piston and Sleeve Valve.**

being brought consecutively into operation, and automatically.

Centrally located in the main body of the device is the automatic controlling valve, which slides up and down, and as the surface is constantly washed by the moving mixture, it is kept free from foreign elements. It is stated that the float chamber may be fitted in eight different positions in relation to the throttle valve. Not only is the mixture automatically controlled by the valve member A A, but the latter rises in proportion to the speed of the engine and uncovers the ports of each succeeding choke tube, this bringing the jets into action.

Each jet is calibrated and stamped with the number of cubic centimeters of fuel passing a

To stimulate a keener interest in touring in Nova Scotia, the Halifax Herald and the Evening Mail have donated a handsome trophy for a 500-mile motor car tour from Halifax to Yarmouth and return.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**T**HE Brunner Manufacturing Company, Utica, N. Y., maker of Parker and other forms of air compressors, is producing what is termed the

No. 50 portable outfit, which is high grade in every particular and designed to meet every requirement of service in public or private garages. It is a complete unit, as will be noted by an accompanying illustration, and is easily operated, a socket being fitted to a convenient circuit.

**Hill-Stage Vulcanizer.**

The compressor has a capacity of one cubic foot of free air a minute, and the utilization of a safety valve permits of any desired pressure. The tank is of extra heavy steel, tested to 250 pounds, and is 30 inches long and 12 in diameter. Its capacity is 15 gallons (two cubic feet) and it is claimed that it will inflate two flat tires and harden up from eight to 12 according to their size. When the container is filled it will inflate one 36 by 4.5 casing to 90 pounds, also three to six ordinary sizes before it is necessary to start the motor.

The motor is an electric unit, .25 horsepower capacity, and is capable of starting the compressor against 120 pounds and increasing it to 150. Either alternating or direct current motors are supplied, and of any voltage and cycle. The gears are held to be noiseless through the use of a rawhide pinion and a cut cast iron spur. The truck carrying the equipment is substantially constructed, the forward axle revolving on a king bolt, no casters being used. The forward wheels are cast iron, eight inches in diameter, the rear members 10. Patented cushion tired wheels are furnished at a slight extra cost. Each outfit includes 12 feet of .1875-inch rubber tubing, one stop cock, a 2.5-inch polished brass gauge, a globe valve controller between compressor and tank, electric cord and a tire connection. The finish is

gloss black enamel. The fittings are polished brass and copper. The cost of operation is stated to be from one-quarter to two cents an hour.

### HILL-STAGE VULCANIZER.

The Hill-Stage Company, Anderson, Ind., is marketing what is termed its No. 4 A outfit, which combines compactness and capacity, and it is moderately priced. The unit is wholly self-contained and has a jacketed boiler of large size equipped with either a gas or gasoline burner. It has a capacity of four casings, three tubes, one motorcycle and two bicycle tires at one heat. It is adapted for casings up to four inches, all sizes of tubes and any motorcycle tire.

The equipment includes one tread mold for casings, two inside molds, one large side mold, bead molds (both clincher and Dunlop), surface heating motorcycle molds and steam jacketed bicycle molds, also expansion tank for air. Either air bags or solid pads may be utilized, but the former are recommended. It is stated that but three sizes of air bags are necessary with the outfit. All machines are tested at the factory.

### BUFFALO AIR BRUSH.

The F. J. Leder Company, Buffalo, N. Y., is manufacturing the Buffalo air brush, which is a small automatic hand device designed for spraying or atomizing paint, oil, gasoline or similar substances. It is operated by compressed air and

**Brunner Portable Air Compressor Outfit Utilizing Electricity for Driving the Compressor.**

may be fitted with a flexible air hose if desired. The spray may be controlled as required. Special outfits are made for painting bodies, etc.

## IN THE REALM OF THE MOTORCYCLISTS.

**Dr. Patterson Re-Elected as F. A. M. Head--Dr. Thornley Replaced by Chicago Man on Competition Committee--Racing Results at Denver and Elsewhere.**

**N**INETY-THREE delegates to the national assembly of the Federation of American Motorcyclists in Denver held one of the most exciting conventions the organization has known, July 24-26. The attempt to create a new form of government failed, insofar as concerned the matter of legislating the office of president out of existence, but a return was made to the old method of district representation, although the form was changed materially in some respects. Perhaps the most interesting features of the convention were the re-election of President B. J. Patterson of Pratt, Kan., and the appointment of J. L. Donovan of Chicago to succeed Dr. J. P. Thornley of New York City as chairman of the competi-

**Samuel Koran, Providence, R. I., on Harley-Davidson.**

tion committee. The following official board was elected:

**President.**

Dr. B. J. Patterson, Pratt, Kan.

**Secretary-Treasurer.**

Dr. G. B. Gibson, Westboro, Mass.

**Directors at Large.**

Dr. B. J. Patterson, Pratt, Kan.

G. H. Hamilton, Milwaukee, Wis.

F. I. Willis, Indianapolis, Ind.

**District Directors.**

New England—E. M. Estabrook, Bangor, Me.

Atlantic—Dr. J. P. Thornley, New York City.

Southern—Howard A. French, Baltimore, Md.

Great Lakes—W. M. Johnson, Chicago, Ill.

North Central—C. W. Waughop, St. Louis, Mo.

South Central—D. P. T. Doenitz, Denver, Col.

North Pacific—J. F. Gorman, Seattle, Wash.

South Pacific—C. S. Pixley, Sacramento, Cal.

**Committee Chairmen.**

Competition—J. L. Donovan, Chicago, Ill.

Legal Action—O. F. McLain, Indianapolis, Ind.

Committee chairmen are appointed by the president with the approval of the board of directors, of which the president is chairman. No mention has been made of changes in the personnel of other committees, and it is presumed that they will remain in charge of the men who have conducted their affairs during the past year.

The proposal to abolish the office of president was first disposed of, after which Dr. Patterson was nominated to succeed himself. The opposition named Clarence S. Pixley of Sacramento, Cal. Just before the ballot was taken an effort was made to nominate O. F. McLain of Indianapolis, one of Dr. Patterson's chief supporters, but he refused to permit the use of his name. The result of the ballot was 51 votes for Patterson and 41 for Pixley. Dr. Gibson was re-elected for the 11th term as secretary without opposition. The office of treasurer was combined with that of secretary some three years ago.

The constitution was then amended to permit a return to the district form of government, increasing the number of directors from nine to 11 and providing for the election of territorial directors either by mail vote or in district convention. This portion of the rule will not go into effect until 1914, and in the meantime the geographical lines of the new districts will be decided upon.

### Race Results at Denver.

Some good racing was witnessed during the annual national meet in connection with the convention of the F. A. M. in Denver. Much of the interest centred in the outcome of the competition for the Bosch trophy in the national amateur events, but other races served to hold the attention of the crowd. The new M. M. A. cup was taken by W. Feuerstein of Norfolk, Va., on an Indian. Charles Balke, also on an Indian, was declared national professional champion. The results follow:

#### First Day, July 25.

One mile, national amateur championship—First, Constant, Indian; second, Feuerstein, Indian; third, R. Attaberry, Indian; time, 0:58.8.

Two miles, national amateur championship—First, Constant; second, Feuerstein; third, Attaberry; time, 1:57.4.

Five miles, national amateur championship—First, Constant; second, Feuerstein; third, Attaberry; time, 4:57.

Twenty-five miles, national amateur championship—First, Constant; second, Attaberry; third, Feuerstein; time, 25:14.

Merkel and Yale Agency Maintained by Marceau Bros., Pawtucket, R. I.

Five miles, open, professionals—First, Balke, Indian; second, Boyd, Indian; third, Goudy, Excelsior; time, 4:23.

Ten miles, national professional championship—First, Balke; second, Perry, Excelsior; third, Armstrong, Excelsior; time, 8:47.2.

#### Second Day, July 26.

One mile, national professional championship—First, Balke; second, Kenney, Excelsior; third, Boyd; time, 0:51.

Ten miles, national amateur championship—First, Constant; second, Feuerstein; third, Odiorn, Indian; time, 9:13.4.

Five miles, amateur for M. M. A. cup—First, Feuerstein; time, 5:11.8.

Ten miles, open, professionals—First, Perry, Excelsior; second, Balke; third, Armstrong; time, 8:46.4.

#### Third Day, July 27.

Five miles, amateurs—First, Knight, Indian; second, Hoblett, Indian; third, Odiorn; time, 4:56.

Five miles, professionals—First, Perry; second, Goudy; time, 4:16.

Ten miles, amateurs—First, Knight; second, Odiorn; third, Denberg, Indian; time, 10:14.6.

Ten miles, professionals—First, Perry; second, Goudy; time, 8:28.8.

#### Bosch Trophy Not Awarded.

The competition for the Bosch trophy, presented by the Bosch Magneto Company, New York City, was not completed at the Denver convention, it having been decided to postpone the running of the 50-mile event until the birthday celebration of the F. A. M., at the Empire City track, New York City, Sept. 5-7. This trophy is awarded annually according to a point system, and the standing of the contestants at the conclusion of the Denver meet was as follows:

| Rider          | Miles | 1  | 2  | 5  | 10 | 25 | Total |
|----------------|-------|----|----|----|----|----|-------|
| J. U. Constant | 4     | 6  | 7  | 8  | 12 | 37 |       |
| W. Feuerstein  | 3     | 4  | 5  | 6  | 5  | 23 |       |
| R. Attaberry   | 2     | 2  | 3  | .. | 7  | 14 |       |
| Charles Odiorn | ..    | .. | .. | 4  | .. | 4  |       |

Constant hails from Brooklyn, N. Y.; Feuerstein from Norfolk, Va.; Attaberry from Pueblo, Col., and Odiorn from Denver. In the 50-mile event the possible points are: First, 15; second, 10; third, eight. Already there is much specula-

tion as to the final outcome of the competition. If for any reason Constant should be unable to start in New York City, Feuerstein might win out by a margin of one point. All four ride Indians. Constant now holds the trophy, having won it last year.

#### Sells Merkel and Yale.

An accompanying illustration presents the agency conducted by James A. and Frank A. Marceau as Marceau Bros., at 213 Lonsdale avenue, Pawtucket, R. I. The agency was established March 16, 1913, taking the local representation for the Flying Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O. So successful were the young men in interesting their friends in the merits of this product that shortly afterward they added the Yale, made by the Consolidated Manufacturing Company, Toledo, O. The two brothers are decidedly energetic and during this first season have found opportunity to arrange a number of events in which the riders in Pawtucket, Central Falls and surrounding towns have taken part with much interest. It is anticipated that with the opening of the 1914 season effort will be made to greatly extend the business, so that there shall be no delay in securing machines for early spring riding.

## ALWAYS READY FOR ANY EMERGENCY!

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1913 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

## The Miami Cycle & Mfg. Co.

320 Hanover St.

Middletown, Ohio, U. S. A.

### Accessory Makers at the Show.

President Coffman of the Motorcycle Manufacturers' Association, which is promoting the national motorcycle show in the Coliseum at Chicago, Nov. 3-8, has received a communication from Manager Sweet of the Motor & Accessories Manufacturers, announcing that the latter organization will sanction the display of products made by its members at this exhibition. The action is taken as a further indication of the success of the second show of this character to be held in this country.

### Manufacturers at Atlantic City.

The annual joint convention of the Motorcycle Manufacturers' Association, the Cycle Parts & Accessories Association and the Cycle Jobbers' Association, opened in Atlantic City, N. J., Aug. 5, with a social session. The next morning the three associations met separately to conduct busi-

**Bernard W. Whitehouse, Waltham, Mass., and His Indian.**

ness, and later took part in a golf match. July 7 there was a joint meeting, at which the following speakers were heard: L. D. Harden, Pope Manufacturing Company, "The Past and Future of the Bicycle"; A. J. Musselman, Allied Motors Corporation, "The Motorcycle"; C. L. Elyea, Elyea-Austell Company, "The Jobber"; Hon. D. S. Troxel, Troxel Manufacturing Company, "The Parts Makers"; J. Leo Sauer, New York City, "The F. A. M."

### Splitdorf Factory Branches.

The Splitdorf Electrical Company, Newark, N. J., maker of Splitdorf ignition devices, announces to the motorcycle trade the establishment of branch stations in all parts of the country, where supplies can be obtained and tests carried on under the direction of factory experts. New stations recently were established at Atlanta, Boston, Chicago, Detroit, Kansas City, Los

Angeles, Newark, New York City, Philadelphia, San Francisco, Seattle, Buenos Aires, London and other foreign ports. Other stations are being established as fast as arrangements can be made and it is the plan of the Splitdorf company to cover the country eventually from coast to coast.

### Jones Wins in a Merkel.

Judging by the large audience at the fair grounds at Dayton, O., July 21, motorcycle racing is in high favor in that city. The meet was held under the direction of the local club. Jones failed to break Baker's track record of 1:08, but considering the fact that the track was quite heavy fast time was made, Jones' Merkel mount only falling short by four seconds. Following are the summaries:

Three miles, amateurs—First, Lewis, Thor; second, Kinzig, Indian; time, 4:25.2.

Five miles, professionals—First, Evans, Indian; second, Gardner, Excelsior; third, Gandner, Indian; time, 6:19.8.

One mile, time trials—First, Jones, Merkel; time, 1:12.

Ten miles, professionals—First, Evans, Indian; second, Gardner, Excelsior; third, Jones, Merkel; time, 12:39.

Twenty-five miles, professionals—First, Jones, Merkel; second, Gardner, Excelsior; third, Gandner, Indian; time, 32:00.4.

### Races at Salt Lake City.

The races at Wandemere, Salt Lake City, Utah, are popular with the public and at a recent meet 3500 persons witnessed some excellent performances. In the last race all contestants finished abreast. The events run off were as follows:

Two miles, match, class A—First, Al Ward, Indian; second, J. A. McNeil, Excelsior; time, 1:31.2.

Three miles, class B—First, Burt Smalling, Merkel; second, R. E. Rognon, Indian; third, T. M. Samuelson, Indian; time, 2:16.

Three miles, match, class A—First, Al Ward, Indian; second, J. A. McNeil, Excelsior; time, 2:12.

Five miles, class B—First, T. M. Samuelson, Indian; second, Burt Smalling, Merkel; third, R. E. Rognon, Indian; time, 3:54.4.

Two miles, class A—First, Al Ward, Indian; second, J. A. McNeil, Excelsior; third, F. Whittier, Merkel; time, 1:23.

Six miles, open—First, Al Ward, Indian; second, Fred Whittier, Merkel; third, J. A. McNeil, Excelsior; time, 4:20.2.

### Yale as Clergyman's Assistant.

Rev. George W. Phillips of the First Baptist Church of Hamilton, O., finds the motorcycle useful in his work. He makes his pastoral calls on the members of his congregation with the assistance of a Yale machine, made by the Consolidated Manufacturing Company, Toledo, O., and is able to keep in close touch with those who live in the country districts. Rev. Mr. Phillips maintains that the motorcycle is the best medium for travelling that a minister in a small town can have. He has also used his machine to carry some of his medical friends on urgent sick calls.

### Merkel Takes Three Events.

Fast and exciting races were held at the track at Napoleon, O., July 21, a large gathering of spectators being aroused to great enthusiasm by the close finishes. Following are the summaries:

Two miles, amateurs—First, Gardner, Excelsior; second, Jahns, Harley-Davidson; third, Long, Merkel; time, 3:05.

Three miles, professionals—First, Weitzman, Merkel; second, Gauder, Excelsior; third, Huntsberry, Merkel; time, 3:58.4.

Five miles, amateurs—First, Long, Merkel; second, Gauder, Excelsior; third, Jahns, Harley-Davidson; time, 6:58.6.

Ten miles, professionals—First, Huntsberry, Merkel; second, Weitzman, Merkel; third, Bailey, Yale; time, 12:15.6.

### Motorcycle Tows Hudson Car.

With the prospect of making a sale, Edward Holofcener, Baltimore, Md., dealer in Yale motorcycles, made by the Consolidated Manufacturing Company, Toledo, O., performed a notable feat with one of his stock machines. Mr. Holofcener was told by a Baltimore citizen that if he could tow home his Hudson car, which had become stalled, he would purchase a Yale machine. Much to the surprise of the owner the motorcycle succeeded in pulling the big motor car with three people in it.

### Interested in Producing Handlebars.

After being engaged for many years in the business of manufacturing spokes and pedals, and for more than a year with the magneto industry, B. S. Keefer has become interested in handlebars, having acquired a substantial interest in the Chicago Handle Bar Company, Shelby, O. Mr. Keefer was treasurer and manager of the Standard Company, Torrington, Conn., for many years, and about a year ago became treasurer of the Splitdorf Electrical Company, Newark, N. J., maker of Splitdorf magnetos.

### Barkelow Succeeds Merkel.

Announcement is made by the Miami Cycle & Manufacturing Company, Middletown, O., maker of the Flying Merkel, that C. S. Barkelow has succeeded J. F. Merkel as mechanical engineer.

He will maintain headquarters at the new Indianapolis branch plant of the company, although, of course, some of his time will be spent at the main factory in Middletown. Machinery for the new Indianapolis building is being installed and it is expected that the work of manufacture will be under way before Aug. 15. The company states that its new models will be ready for delivery by Sept. 15.

### Club Notes, Here and There.

The Bay State Motorcycle Club of Boston, Mass., recently enjoyed a reliability run to Keene, N. H. Of the 14 who started, seven finished with perfect scores, despite some very bad roads en route.

The following members of the Harley-Davidson Motorcycle Club, Philadelphia, were given perfect scores in a road race held recently: John Seifert, John Brown, J. C. Wilde, Howard Kolp, George O'Malley, Alexander Klein, Walter Moon, Herman Harvey, William Mattner, G. Haitch.

The Indian Motorcycle Club, Cincinnati, O., will hold a series of motorcycle races at the Lantonia track, Labor Day. Three important events are to be arranged with suitable prizes, for amateurs and professionals.

The members of the Reading Motorcycle Club, Reading, Penn., held a recent meeting in front of their headquarters, 517 Penn street, which were destroyed by fire a short time before. The club hopes soon to secure temporary rooms for future meetings.

Thirty-six members of the Goshen Motorcycle Club, Goshen, Ind., recently made a run to Rome City, where they enjoyed bathing, boating and a fish and chicken dinner.

The Toronto Motorcycle Club, Toronto, Can., held its annual run to Rochester, N. Y., under conditions that were not the best. A heavy downpour of rain at the start deterred many, who had made preparations, from going, while others went by boat to Buffalo, N. Y., and joined the riders there. They were given a fine entertainment by the Rochester Motorcycle Club.

C. S. Barkelow, Mechanical Engineer, Miami Cycle and Manufacturing Company.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, supplies, etc.:

**City Automobile Company**, Washington, Ind.; \$3000; G. H. Greenwood, L. G. Helphenstine, A. L. Kennedy.  
**Schlick Wheel & Tire Company**, Wheeling, W. Va.; \$150,000; A. Schlick, J. E. Morgan, D. H. Taylor, L. F. Gundling, R. Walter, Marshall Statler, O. A. Statler.  
**Bell Locomotive Works**, Yonkers, N. Y.; \$20,000; H. W. Bell, J. H. Bell, W. G. Bellows.  
**Haynes-Diefenderfer Company**, New York City; \$10,000; A. J. Diefenderfer, E. Hayes, L. W. Bennett.  
**Steinbock Engineering Company**, New York City; \$250,000; H. F. Steinbock, A. B. Gormully, F. C. Slevvers.  
**Standard Purchasing Company**, New York City; \$10,000; H. F. Dexter, M. H. Brooks, H. L. Cook.  
**City Auto Corporation**, Pulaski, Va.; \$10,000; S. M. Lyons, W. H. Wysor, R. L. Gardner.  
**LeCompte Cycle Car Corporation**, New York City; \$60,000; G. Goldmark, L. S. Higgins, H. R. Buckingham.  
**National Motor Truck & Manufacturing Company**,

manufacture tires; E. M. Trautman, F. A. Webb, C. Colsten.  
**Blue Hill Avenue Garage**, Boston, Mass.; \$10,000; F. H. Sidelinger, W. A. Clark, S. W. Culver.

**Grand Avenue Company**, Brooklyn, N. Y.; \$500; to manufacture motors; G. F. Mason, F. G. E. Strohsall, H. W. Bender.

**Chauncey S. Greene Company**, Boston, Mass.; \$20,000; A. A. Hoyt, B. S. Atwood, C. S. Greene.

**E. A. Laboratories**, Brooklyn, N. Y.; \$200,000; to manufacture accessories; E. Aufero, M. Aufero, D. Aufero.

**Moebius Wheel Company**, Boston, Mass.; \$100,000; A. F. McGettrick, G. B. Ryan, F. E. Peaslee.

**Wood Auto & Machine Company**, Carrollton, Ky.; \$10,000; E. A. Wood, J. P. Monnyhan, E. C. Smith, P. B. Gaines.

**Marathon Automobile Company**, Boston, Mass.; \$20,000; W. S. Killars, A. L. Schoolcraft.

## WITH THE MANUFACTURERS.

**The Lauth-Juergens Motor Car Company**, Fremont, O., maker of Lauth-Juergens trucks, has elected the following directors: J. Lauth and P. Lauth of Chicago; L. C. Worst, J. W. Worst, J. W. Forsyth, W. A. Lucas, L. W. Overmeyer and A. E. Culbert.

**W. F. Evans** of the McCue Company of Buffalo, N. Y., has made the announcement that Roger B. McMullen has been made general distributor of McCue wire wheels and axles, with headquarters at Chicago and Detroit.

**The Lozier Motor Company**, Detroit, maker of Lozier cars, believing that its business interests and patrons are better served by capable agents than by branch houses, has discontinued its branches in all the large cities, replacing them by well known and strong dealers. Harry S. Houghton, Inc., New York City; Albert W. Woodruff, Inc., Boston, and the Bigelow-Wiley Motor Car Company, Philadelphia, are concerns which have just been organized to handle Lozier machines. The Bird-Sykes Company, Chicago, has taken the Lozier interests in that city, while the Bekins-Speer Motor Car Company, Los Angeles, Cal., which has represented the Lozier in that city the past three years, has also taken over the San Francisco territory.

**The White Company**, Cleveland, O., maker of White pleasure and commercial vehicles, recently opened a new salesroom and service station at 216-218 North Broad street, Philadelphia. As is true of all the branch houses of the White company, provision is made to take care of every need of White users in the entire district served from Philadelphia. An accompanying illustration presents the new building.

**The Kissel Motor Car Company**, Hartford, Wis., announces the following agents for KisselKar trucks and pleasure vehicles: J. T. Gentry, San Bernardino, Cal.; Glenn A. Calkins, Riverside, Cal.; Fred Duvall, Pomona, Cal.; George Gilmore, El Centro, Cal.; Joseph S. Peoples, Petaluma, Cal.; Benjamin L. Brundage, Bakersfield, Cal.; P. J. Weisel & Co., Anaheim, Cal.; J. C. Phelan, Fresno, Cal.; Pacific KisselKar branch, Oakland, Cal.; West End Garage, Santa Ana, Cal.; E. B. Jones, Hornell, N. Y.; Empire garage, Middletown, N. Y.; Flato & Allen, Kingsville, Tex.; Oliver-Nussbaum-Scharf Company, Groesbeck, Tex.; W. S. Mattox, Greenville, Tex.; Lyscio & Walker, Joplin, Mo.; Nemic & Biscenius, St. Cloud, Minn.; J. W. Bush, Oakes, N. D.; New Island City Garage, Galveston, Tex.; Reno Nevada Company, Reno, Nev.; William Daly, Paterson, N. J.; Thomas Plimley, Victoria, B. C.; Kentucky KisselKar Sales Company, Lexington, Ky.; Waterloo KisselKar Company, Waterloo, Ia.; Douglass Motor Car Company, Douglass, Ariz.

**The Falls Cities Motor Company**, organized to take over the plant of the Ohio Falls Motor Company at New Albany, Ind., has been incorporated.

**The Whitney Manufacturing Company**, Hartford, Conn., has sold its 20-inch water tool grinder to the Taylor & Fenn Company, Hartford, and will now devote its entire attention to the manufacture of driving chains, keys and cutters for the Woodruff system of keying and hand-feed milling machines.

**The A. O. Smith Company**, Milwaukee, Wis., announces that because of the necessity for additional space for its frames and other pressed steel parts, the manufacture of the Smith multiple disc clutch will be

**New Salesroom and Service Station of the White Company in Philadelphia.**

Gibsonburg, O.; \$250,000; E. C. Russell, C. H. Hutchison, J. H. O'Leary, A. T. Crossett, F. E. Lamb, J. E. Weisel, N. W. Russell.

**John E. O'Neill**, Lawrence, Mass.; \$3000; automobiles; J. E. O'Neill, M. J. Ganley, E. J. Farley.

**Talking Horn Company**, Middletown, N. Y.; \$10,000; N. C. Oddo, T. H. Bingham, F. W. Morgan.

**Motor Machine Company**, Mobile, Ala.; \$10,000; W. D. Bellingrath, J. E. Lewis, G. W. Morse.

**Anthony Auto Repair Company**, New York City; \$10,000; J. Yandrasitch, F. M. Struckhausen, H. Struckhausen.

**Vacuum Tire Corporation**, New York City; \$50,000; W. J. Woodcock, C. G. Ross, F. L. B. Gartner.

**W. L. Auto Top Lifting Company**, Cincinnati, O.; \$10,000; W. Wirth, Oscar Lane, H. W. Fraser, G. M. Reswick, J. B. Clark.

**Ohio Buick Company**, Cleveland, O.; \$200,000; R. H. Lee, W. J. Patterson, G. R. Collar, G. M. Gallagher, E. M. Holmgren.

**C. & B. Garage**, Chicago; \$1000; A. E. Cosey, K. R. Ballentine, S. J. Matthews.

**John V. Wilson Company**, Boston, Mass.; \$20,000; E. T. Carr, J. V. Wilson, P. H. Skidmore.

**Trautman Corporation**, Brooklyn, N. Y.; \$1000; to man-

# Tarvia

*Preserves Roads  
Prevents Dust~*

Chestnut Street, Sewickley, Pa. Resurfaced with "Tarvia X."

## Sewickley's Experience with Tarvia

The Borough of Sewickley, Pa., has used "Tarvia A" as a surface treatment on its macadam roads for several years. Some of these were last treated in 1909 and all are still in excellent condition.

Chestnut Street has been resurfaced and other heavily-traveled thoroughfares have been constructed with "Tarvia X" as a binder. The local authorities report that they are "well pleased with the results."

In December, 1912, M. M. Baker, Borough Engineer, wrote:—

During the past few years the Borough of Sewickley has used "Tarvia X" and "Tarvia A" in the construction of new driveways on some of the most heavily traveled streets, and for re-sur-

facing of a number of streets situated in the residence section.

Both of these paving materials have stood the test well and we are glad to have the opportunity of expressing our satisfaction with the way in which they have "made good," and to recommend them for use in other municipalities where a first-class paving material is desired.

"Tarvia X" is a dense, viscid coal tar product which thoroughly binds and waterproofs the crushed-stone wearing course of modern roadways and pavements. "Tarvia A" is of lighter consistency for use in surfacing water-bound macadam roadways. "Tarvia B" is a dust layer and road preserver used cold on macadam roads already in use.

*Booklet on request*

### BARRETT MANUFACTURING COMPANY

New York Chicago Philadelphia Boston St. Louis Kansas City Cleveland  
Cincinnati Minneapolis Pittsburgh Seattle Birmingham  
THE PATERSON MFG. CO., Ltd.:—Montreal Toronto Winnipeg Vancouver St. John, N. B. Halifax, N. S. Sydney, N. S.

When Writing to Advertisers, Please Mention The Automobile Journal.

transferred to the Universal Machinery Company of Milwaukee, which will hereafter make the clutch under the supervision of the Smith company.

**The Splitdorf Electrical Company of New York**, branch of the Splitdorf Electrical Company, Newark, N. J., maker of Splitdorf ignition devices, announces the opening of a factory branch at 210-212 North 13th street, Philadelphia, Penn., equipped to supply every form of Splitdorf product and to render an ignition service complete in every detail. C. C. Munson, a member of the Society of Automobile Engineers, is in charge of the branch.

**The Peerless Motor Car Company of New York**, factory branch of the Peerless Motor Car Company, Cleveland, O., maker of Peerless machines, has appointed Fred H. Cozzens manager of the motor truck sales department.

**The Henderson Motor Car Company**, Indianapolis, Ind., maker of Henderson cars, has appointed the following agents for its product: Henderson Motors Company, Toronto, Can.; Crossem & Searer, Joliet, Ill.; J. W. Grone-wold, Golden, Ill.; Lane Hardware Company, Robinson, Ill.; Jackson Motor Car Company, Nashville, Tenn.; Dunham & Long, Westboro, Mo.; American Sales Company, Louisville, Ky.; T. M. Bowler, Sheboygan, Wis.

#### GARAGE AND DEALER.

**The E. V. Stratton Company**, Albany, N. Y., as a result of its exceptional 1913 business in Hudson cars, made by the Hudson Motor Car Company, Detroit, has had its 1914 territory extended to include all of New York State west to and including Montgomery and Franklin counties, and south to part of Ulster and Dutchess; five counties in Vermont and three in Massachusetts, including the city of Springfield. John S. Harrington, formerly of Worcester and Boston, has been secured by the Stratton company to handle its Springfield district on Hudson cars and Stewart trucks.

**John A. Hamilton**, for many years in charge of the accessory department and buyer for Gibbes Machinery Company, Columbia, S. C., on Aug. 1, opened an accessory and supply business under his own name at 1216 Main street, Columbia. It is understood that the Gibbes Machinery Company will discontinue the accessory jobbing business and that Mr. Hamilton will succeed to that branch of its business.

**The Miles Standish Auto Company**, Oakland, Cal., will open a garage on 22nd street, Richmond, Cal.

**E. B. Stimson** has organized the Stimson Automobile Company at Minneapolis, Minn., and will handle the Wahl car, a new machine on the market.

**The Hilmer Shull Auto & Supply Company**, La Porte, Ia., is to erect a new garage.

**G. W. Stephens**, formerly with Carl Estabrook of Three Rivers, Okla., has opened a garage at Pawhuska, Okla.

**The State Automobile Company**, Detroit, has been formed to handle R-C-H cars, made by the R-C-H Corporation, Detroit, in northern Indiana and the lower peninsula of Michigan. Comprising the new firm are A. H. Collins and D. E. Wells, both men of wide experience and well known in the selling end of the industry.

**The Stocum-Bronson Automobile Company** has been organized at Oshkosh, Wis., to take over the garage of Philip W. Stocum, 43-45 Ceape street. The garage will be enlarged and much new equipment added. The principal owners of the concern are Mr. Stocum and Leslie K. Bronson.

**The Gauntlett Auto Sales Company**, Toledo, O., Buick distributor for northwestern Ohio and southern Michigan, has moved into the three-story building at 1014-1016 Madison avenue, formerly occupied by the Packard agent. E. D. Gauntlett is the head of the firm, which was formed at Toledo during the spring automobile show, since which time its territory has been materially increased.

**The W. S. Williams Auto Sales Company** has opened for business at Oshkosh, Wis. It has a three-story building at Otter and State streets.

**The D. K. S. Auto Supply Company**, Cape May, N. J., is building a new garage which is nearly completed. The company handles Ford cars, made by the Ford Motor Company, Detroit.

**Harry H. Keech**, Edmund A. Ringel and Clarence Salenstine have opened the Grove Street Garage at Milwaukee, Wis., the business being capitalized at \$5000. Mr. Keech formerly operated a garage on National avenue in that city.

## Round the World ON J. M. SHOCK ABSORBERS One More Instance of J. M. Efficiency!

From England and the Continent to the Holy Land, and through Egypt, Asia, India, China, Japan, Philippine Islands, Australia and South America to Panama and thence to San Francisco in time for the Panama Exposition in 1915—this is the stupendous route over which Edwin F. Kohl (of the University of Wisconsin) proposed a tour by motor car. Throughout the entire distance, roads of every description to the far corners of the earth, he will ride on **J. M. SHOCK ABSORBERS**.

Realizing that none but the best shock absorber should be intrusted with the important task of reducing jolting and vibration to a minimum, throughout such a long and arduous journey, many weeks were spent experimenting with various devices. The selection of **J. M. SHOCK ABSORBERS** was the result and the car equipped is now well started on its globe-encircling journey.

The same reasons—maximum efficiency and unrivaled durability—proven by actual experiment, induced A. J. Westgard, veteran pathfinder and pilot of the A. A. A. to equip his official car with **J. M. SHOCK ABSORBERS** for the transcontinental route-making work with which he is now engaged.

The same conclusions—arrived at by means of unique graphic experiments—caused Earle L. Ovington, the famous Boston aviator and mechanical expert, to endorse **J. M. SHOCK ABSORBERS** with his unqualified approval, after concluding the most remarkable series of vibration records ever attempted.

## Approved by Motorists the World Over

The fame of **J. M. SHOCK ABSORBERS** is not merely local—it is international. In every civilized country on the globe J. M. equipment is seen on the cars of experienced motorists, whether encountered on city boulevards or on mountain passes.

**Booklet "D" Contains Facts That You Should Know.** Gives the complete results of the noteworthy Ovington tests, illustrated by graphic diagrams made by the J. M. itself. Sent free, postpaid, on request.

# BURN-BOSTON BATTERY

## CUTS DOWN COST—INCREASES EFFICIENCY

Think how often dry cells have failed you without warning; think how many you have had to use already this season.

Occupies same space as dry cell and used the same way.

What do you say to a set of six Burn-Boston cells which ran a four cylinder, two cycle car 14,000 miles in fourteen months with an Atwater-Kent system and no other source of current? What about six Burn-Boston cells that ran a Klaxon horn for four seasons and into the fifth?

Doesn't this Burn-Boston service mean saving of money, time, worry, annoyance and insecurity? Aren't Burn-Bostons that do this sort of thing worth while to use, even at a higher first cost? You are buying a *cheap*—not an economical—source of current when you buy dry cells. A penny saved is a penny lost—if you buy dry cells.

But we cannot consistently sell you Burn-Boston Supercells unless you have been getting fair averages from dry cells as dry cells go. If you have not, it means that your wiring is bad, your current is getting a ground through faulty insulation, or your coil is old and needs renewing or adjusting, or you have been leaving your switch on while the engine is standing still—a process which takes about ten times the current drawn by a running engine. Under those conditions the Burn-Boston Supercell will last but little longer than the dry cell.

The Burn Boston is used by the War Department, the Navy Department, the New York Fire Department and those enlightened concerns all over the country which believe in true economy and absolute reliability.

Get Burn-Bostons of your dealer. If he cannot supply you, send us his name and we will see that you are supplied.

**BURN-BOSTON BATTERY, 19 Doane St., Boston, Mass.**  
Write today for Booklet "Service Performances" which further tells the story of economy and efficiency.

# 40 Gallons Less

With a Planhard

New York  
to Albany  
Race

Absolutely  
Automatic  
Note  
Simplicity

Eisner-  
Lenk Co.

1074 Boylston St.  
Boston, Mass.

Want Dealers in  
New England  
Cities to Handle  
Planhards

Planhard Mfg. Co.—My engine on Excelsior is a home-made 2 cycle 3 cylinder 4 1/4 x 5 inch. The very best I ever did with the S— carburetor was 380 R. P. M., and I am now making 625 under the same conditions with a Planhard. Two years ago in the New York to Albany race I used 105 gallons of gasoline in 27 hours 57 minutes. This year I only used a trifle over 65 gallons. I had to sell surplus gasoline at Edgewater for 18 cents that I paid 22 for in Albany, as I had no place to store it, so you see how it worked.

The race just completed was splendid, and I should have done better time had I followed the New York M. B. C. courses better, but I disobeyed its instructions and ran on a mud flat above Coxsackie. Coming back my timer broke when I was off Fishkill Landing and I limped home, making wooden plugs as fast as they wore away. However, with all delays the Planhard enabled me to beat my previous record 1 hour 45 minutes.

Thomas Trolsen.

## Best Croxton Could Find

The Planhard Mfg. Co. May 20, 1913.  
Gentlemen—We have decided to adopt the Planhard as "Croxton" carburetor equipment because we find it excels all others in economy, power, speed and most important of all in a pleasure car—flexibility. We determined to make the "Croxton" superior to any automobile in its class in every way, and only the best accessory of its kind, regardless of price enters into its makeup.

Realizing the importance of the carburetor as the most vital single factor in the operation of a car—especially now with the low and variable grades of gasoline commercially available, we determined that the "Croxton" should be the most modern, dependable and faultless, in this all important respect.

With this end in view, we laid out a series of heart-breaking tests for carburetors that would leave no doubt whatever as to the results of our decision. Your carburetor left all others at the post.

We congratulate you on your possession, and wish you every success.  
Very truly yours,  
THE CROXTON MOTOR CAR CO.,  
J. P. Stoits, President.

## 25 Miles to Gallon on Ford

Gentlemen—After taking the old carburetor off my Ford car and putting on a Planhard, I increased my mileage from 18 to 25 miles per gallon, and my engine, which was a notorious heater, runs as cool as desirable for the best results. I am using 60 to 62 gasoline, and as I have a hydrometer, I know what I am talking about.

A. W. Grandon.

## Try the M&M Economizer For Speed, Power and Economy

HOW ABOUT THIS LETTER!

Moller Brothers, Philadelphia, Pa. Woodbury, Pa., April 1, 1913.  
Gentlemen:—I received the M&M and have already installed it on my Model C Schacht Car. I certainly find it O. K. It does all you claim for it and even more. I had considerable misfiring in one cylinder ever since I have had my car (which is 17 months), and since I have used the M&M the misfiring has all disappeared. It is certainly astonishing the difference it makes on the power and speed of the car. Also the beauty of coating down grades and saving fuel. I can highly recommend this device to anyone. I already have some prospective customers and will thank you to forward your agents proposition.

Thanking you kindly, I beg to remain,  
(Signed) H. G. MILLER, R. F. D. No. 1.

WHAT COULD BE MORE CONVINCING THAN THE ABOVE LETTER! ALSO, the M&M is guaranteed to do just what we claim, and if it proves unsatisfactory within thirty days, YOUR MONEY WILL BE REFUNDED. (Reference—Citizens National Bank, Lewistown, Pa.) The M&M is guaranteed to save from 40 to 50% of gasoline, and increase the speed and power 20% with less gasoline, and less carbon. It is the only known carburetor adjuster on the market, and RANKS FIRST AS A CARBON ELIMINATOR. For priming the motor, you cannot find its equal. PLEASE BEAR IN MIND—THERE IS NO SCREEN, or any other obstacle placed in the manifold, as this will have a tendency to CLOG THE MANIFOLD, and make it more difficult for the motor to absorb the gas and air.

PRICE OF THE M&M—\$3.50 and 17c extra for postage. We include either friction foot pedal, or steering post control, which consists of flexible shaft and wire. Requires 3/4" pipe tap, which can be reduced to 1/2" by means of an elbow or a common reducer.

PRICE OF THE MOTORCYCLE SIZE—\$1.25 Prepaid. Size 3/4".  
THE M&M ECONOMIZER IS "THE PATENTED ONE." Warning to users, makers and dealers, PATENT NO. 922,523—May 25, 1909.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

**We Want  
YOU to  
Judge EMCO  
AUTOMOBILE  
OIL**

**T**HERE is a great deal of uncertainty among motor car owners concerning the subject of lubrication. For this reason we offer the motoring public a guarantee absolutely devoid of obligation.

If EMCO OIL does not prove satisfactory to YOU in absolutely every respect, we will refund your money in full—pay freight (both ways if oil is returned) and make no charge for oil used in trial.

Being the largest independent refiners of Pennsylvania Crude in the world (annual capacity more than 1,000,000 barrels) we offer in EMCO an automobile oil of the highest quality, free from all animal, vegetable and acid ingredients, lasting nearly twice as long as most oils, and far cheaper in the end. We want you to try EMCO as thousands have done to their great satisfaction. If your dealer cannot supply you, we will ship EMCO direct in 5 or 10 gallon cans, barrels or half barrels.

# HAYNES

## First of the Old Line Cars to Adopt the Vulcan Electric Gear Shift

Ever since Elwood Haynes created America's first gasoline car and drove it down the streets of Kokomo, two decades ago, the Haynes has been a pioneer, a pace-maker in developing the Automobile, and adding new improvements. At the top of the next page is a long list showing that the Haynes has been first to use a majority of the important improvements. And now the Haynes again comes to the front,

### SCORING ANOTHER BIG FIRST

The new Haynes models, are first for up-to-date equipment. They have absolutely everything that makes a car easy to start, control and ride in. The Haynes reputation is of the best. Haynes reliability and economy are common talk with the trade.

They have complete electric equipment; electric starter, electric lights, electric gear shift.

The cowl-board conveniences include switch for electric lights, oil sight feed, ignition, automatic cut-out for lights, dash light, auxiliary air-pressure pump, air gauge and speedometer.

Regular equipment includes mechanically operated tire pump. The gasoline supply is automatic pressure-feed.

The gasoline capacity is larger than the average.

The design is new. The lines are longer and more sweeping. It's a grand car through and through.

Read the specifications, see what great cars we have for you in the new models and remember that same sturdy reliability is put into these cars as has been built into the Haynes for twenty years.

#### Specifications of the New Haynes

**Motor**—Bore 4 1-4 in., Stroke 5 1-2 in. L-head Haynes. Cylinders cast in pairs.

**Cooling**—Centrifugal pump and pressed steel fan.

**Wheel Base**—Model 26, 130. Model 27, 136. Model 28, 118.

**Ignition**—American Simms Magneto.

**Lubrication**—Splash and gravity feed.

**Control**—Left hand. Vulcan Electric Gear Shift.

**Transmission**—Selected Type, three speeds forward, one reverse.

**Steering Column**—Worm and worm gear type.

**Clutch**—Haynes contracting steel band.

**Rear Axle**—Full Floating Timken on Models 26 and 27; McCue, Model 28, Gourney Bearings.

**Front Axle**—I-Beam. O. H. steel heat treated.

**Wheels**—Artillery type. Funk demountable rims.

**Tires**—Models 26 and 27, 36x4 1-2. Model 28, 34x4.

**Springs**—Front Semi-elliptic 39 1-8x2, rear 48x2.

**Brakes**—15 1-4 external and 15 internal on Models 26 and 27. 12 and 16 internal on Model 28.

**Finish**—Indiana dark blue body. Pacific Tour gray, optional.

**Gasoline Feed**—Pressure. Automatic feed.

**Upholstery**—Buffed leather—deep cushions.

**Starting and Lighting**—Leece-Neville electrical system.

**Dash Equipment**—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge and speedometer. Models 26 and 27 have rim wind clock and shock absorbers.

**Other Standard Equipment**—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind-shield, Vulcan electric gear shift, two large electric headlights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 80 ampere hour storage battery, speedometer, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim and Collins curtains.

Model 27—6 cylinder, 136-wheel base, 7-passenger. Price \$2785.

## Other Haynes Firsts

The first gasoline driven American-made car.  
 The first two-cylinder opposed motor car.  
 The first user of aluminum in crank case.  
 The first to use nickel steel in the axles.  
 The first side door car.  
 The first to use throttling carburetor.

The first to use make and break spark.  
 The first to use the jump spark.  
 The first to use electric ignition.  
 The first to use a magneto.  
 The first to use double independent system of ignition, through two sets of spark plugs.

## First Come—First Served

will be the rule in allotting cars to the few new dealers which the increased Haynes output permits us to serve.

Contract now for your share of

## Haynes Cars With the Electric Gear Shift

You know what happened when the electric self-starter was introduced a couple of seasons ago. You recall how prospects flocked to see the cars with the new feature. You remember how the electric starter idea took and you also know what a hit the introduction of electric lights made. It's easy to forecast the hit that the electric gear shift will make. It is a greater improvement than either electric starter or lighting.

Possessing qualities for which they are famous—backed by 20 years of reputation—possessing everything else in modern equipment, the new Haynes models with Vulcan Electric Gear Shift give you the greatest selling proposition in the field.

Regular Haynes dealers, of course, have the first claim on our output, but our capacity has been increased and there will be cars enough for a few new dealers. If you want to grasp this unequaled opportunity, better telegraph, write us special delivery or better still, hop on a train and come to Kokomo.

**The Haynes Automobile Co., 6 Main St., Kokomo, Ind.**

## McCUE WIRE WHEELS

**O**NLY one tire burst in 570 mile race. Boillot, winning the French Grand Prix on a wire wheel Peugeot, blew out but one tire in the entire 570 miles. Towards the end of the race while making a stop for fuel he changed one other as a matter of precaution. The Excelsior cars, two of them, ran the entire 570 miles without making one single tire change. Commenting on the tire situation in this race "The Automobile" says: "There was very little tire trouble in the race. . . . Altogether the tire situation was very satisfactory, for this was the longest road race in the world—570 miles—and all European speed records were broken."

*Can you ask for more certain proof of the tire economy feature of wire wheels?*

Not a single wooden wheel equipped car competed in this French classic—certain proof of the confidence the world's greatest drivers have in the tire saving ability of wire wheels.

Insist upon wire wheels on your car for the reason that wire wheels

Increase tire mileage about 50 per cent.  
Safeguard your life in case of accident.  
Increase your car life.

Make an easier riding car.  
Make an easier steering car.  
Make a better looking car.

Increase your mileage per gallon of fuel.

McCue Wire Wheels are equipped with (S) spokes, made by the Standard Company, of Torrington, Conn.

## Only Your Private Whether It's Time to

The automobile business *is* a business—not a pastime. It pays better for brains and backbone than most businesses. It penalizes mercilessly the chap who attempts to play with it and repays most liberally the man who works at it intelligently.

### Your Bank Roll is the Product of Your Brain

When you select a line of motor cars your fate is absolutely in your own hands. Success or failure is yours. Will you choose a car which eats up all your profits in service or will you select the car which stands up and keeps going smoothly in the hands of the average user?—that's the fellow you have to figure on. He's the chap who drives his car *hard*, breaks everything that will break, and tries to make you take the cost of maintenance out of your own profits. When you start to investigate various cars—think. While you are investigating them—*think*. Before you sign anybody's contract—THINK.

Make the maker whose contract you sign answer these questions to your satisfaction:

First: Is your car standardized—is it made out of parts which the public knows are the best

parts in the world's market—the standardized parts—the parts which offer the least possible sales resistance? The more easily a car sells the more sales you can close and the more money you can make—friend dealer.

Second: Is the stuff in your car so good that it is not continually breaking and costing the dealer unnecessary service expense? Service is the rat-hole down which most dealers put their profits. The sooner you stop this rat-hole with a Cole contract the sooner you will

### Make More Money

Third: Is your factory discounting all its bills—has it done so from its very beginning? Is it sound, and permanent and resourceful enough to always insure prompt fulfillment of orders? Will it be here to make good to your patrons the promises you have made them in good faith? Ask Bradstreet's and Dun's about them. It's rating and financial integrity which counts in this business, which gives you the backing which in turn makes it possible for you to—*Make More Money*. The Cole Motor Car Company in its entire history has never yet failed to discount a bill.

Fourth: Is the car in question beautiful,

## Cole Motor Car Company, Indianapolis, U. S. A.

# Ledger Can Show Hook Up With Cole

luxurious and full of eye appeal, aside from being sturdy and stout and strong? Remember that the woman in the case must like it before the man in the case will put up real money for it. The Cole is Motordom's fashion plate—the standard of beauty and the acme of “guts.” It couldn't be otherwise, because actually the world's greatest designers live over the drawing-boards whereon the lines and the construction of the Cole are determined—it is this beauty and beefishness of the Cole which helps you—make more money.

Fifth: Then show Mr. Manufacturer this Roll of Honor, and ask him how many of these standard parts are in *his* car. Then just silently bear in mind that the Cole has *all of them*.

There's no use going any further, now. You either believe in making more money or you are—content. If you believe in—more money you believe in the Standardized Car—the Cole. If you're content, stay with your present proposition—we can't make money for contented men. We want men who fight for supremacy—who stick out their chrome nickel jaws and bore in after business till competition tucks its tail and

runs. That's the kind the Cole Sales organization is made of. If you're our kind we can certainly guarantee that you—make more money. Just drop us a line. We need more men—like you.

Incidentally we have doubled our output and are in shape to make immediate deliveries. Nothing is of more importance to you than being able to deliver cars early.

## GOVERNMENT ROAD TO ROOSEVELT DAM.

**A Remarkable Piece of Highway Engineering That Cost the United States Half a Million Dollars--What Arizona Is Doing for Good Roads.**

(By Harry Welch.)

**D**O YOU know that the finest road in the country is in Arizona? This road was built by the United States government for commercial purposes. There would be but the winding and weird Indian trail marking the path from Phoenix to the Tonto basin if the great Roosevelt dam had not been built. It was necessary to have a road through the mountains in order to haul the machinery to build the dam. The result is a scenic highway of easy grades, in the midst of a wealth of natural beauty with which only that of the famous Grand Canyon of Arizona can be compared.

From Phoenix to the Roosevelt dam is a trip of 80 miles (79.2 to be exact). It is a journey of constant contrast, of continuous change, through great gorges, along giant cliffs and into cool can-

yons. The strip of desert that is passed on the way presents a picture of plant life that is wonderful. New and strange forms of vegetation are on every hand. Brilliant flowers and a carpet of grasses and greenery make the so-called

desert a garden of delight. Birds are there in numbers—the dainty little Sonora dove, a miniature of the eastern wood dove; the cactus wren, with its nest secure among the spiny branches of the cholla, or giant cactus; great flights of white wings, the wild pigeon of the Southwest; quail, topknotted and plumed, and

General View of the Roosevelt Dam in the Tonto Basin, Near the Confluence of the Tonto and Salt Rivers.

the chattering blue jay as well.

And then the mountains—Old Superstitions with their deep purple shadows, ever changing to blacks and blues, each change bringing out new forms and weird shapes; sheer cliffs, smooth

**Rock Cut on Phoenix-Roosevelt Road Directly Above East Wall of Dam Site.**

faced to contrast with the weatherings of countless years. Here are the evidences of the cycles of time; rock strata that are an open book to the student of geology, limestone and lavas, schists and rich red sandstone.

A trip to the West is an education, and the best way to see the West is by automobile. Following the famous flowing roads in Europe has no more charm than a trip over this wonderful winding way, now gradually ascending to unfold at every turn a new phase in the story of the "building of worlds"; now descending into the canyon to follow along the bank of the Salt river and watch its wonderfully clear water bubble and splash over the rocky bed. The highway passes through a section which was looked upon as practically inaccessible, and is in itself a remarkable engineering achievement. It cost the government a half a million dollars.

Phoenix is the capital city of Arizona, county seat of Maricopa county, and the state's chief commercial and social centre. It has a population of 20,000 and the finest winter climate in the world. The Salt river valley surrounding Phoenix has thousands of smiling farms, orchards blossoming, palms and roses nodding in the sunshine. The valley has 240,000 acres of irrigated land, the richest soil in the world, under the finest and most complete irrigation system that has ever been conceived and built.

The first portion of the trip over the Roosevelt road into the Tonto basin is along this valley to Tempe, a distance of 8.8 miles, with pleasing views of the irrigated lands, made possible through the waters stored in the great Roosevelt dam. Tempe is the gateway to the Salt river valley, a city of 2500 inhabitants on the ocean-to-ocean highway. One of its chief claims to distinction is its municipal water system with water 99 per cent. pure.

The way still leads through the valley to Mesa, 9.8 miles distant, termed the Gem City of the Salt river valley. It is in the most fertile section of the valley and is surrounded by the most densely populated agricultural portion of the

state. The lands have a perpetual right in the irrigation waters of the Salt river. The city itself has a population of nearly 3000, broad streets, comfortable homes and business houses that will compare favorably with those of 5000 to 10,000 inhabitants.

Here alfalfa yields five to eight crops annually. Citrus fruits ripen in time to be harvested and on the market before Thanksgiving Day. Vegetables are grown throughout the entire winter. The summer crops are corn, maize, cane, cotton, sugar beets, watermelons, tomatoes and the famous Mesa cantaloupes. Dairying has be-

**Fish Creek Hill on Roosevelt Road—Mule Teams Are Now Replaced by Motor Trucks.**

come a fine art, some of the finest prize winning herds of dairy cows in the southwest being owned by Mesa stockmen.

Soon after leaving Mesa, the real Roosevelt road is reached, and here every new view is a picture story of the chaos which once prevailed. In the great canyon of Fish creek the road for a mile or more is carved from the face of an immense cliff. From the top of the mountain, at this point 3000 feet above sea level, there is a wonderful view of Fish creek basin. Over 1000 feet below, and straight down, is the little rest house at which a stop may be made for meals. The scenery is magnificent. Sheer walls of sandstone rim the canyon on every side. Every color is reflected in the rocks; every conceivable contour is contained in the canyon crest.

After the descent into the canyon the tourist emerges at its northern outlet and begins a journey along the southern bank of the Salt river. At times the road is carried on a rock wall edging the river. At times it ascends little hills, leaving the stream below. Here are to be seen the long legged crane after fish, the great eagle encircling the peaks and other big birds which greet the stranger with startled screams. Soon the river is left for the last time, and, there begins the climb that will bring the visitor out on the mountain side level with the dam. Long hairpin curves sweep away into the cool shadows of a long, narrow canyon to emerge on a point which overlooks the great work.

At once the panorama opens. Water from Roosevelt Dam, After 80 Miles of Travel, Irrigating Sugar Beets in Salt River Valley.

In front is the great "Atlas of Stone" shouldering the rocks and holding back a great lake of water extending for 12 miles to the north and 12 miles to the south. Twenty-four miles of water—the largest artificial lake in the world. A supply that is large enough to irrigate the 240,000 acres included in the project in the valley 80 miles away.

Two great streams are emerging from the tunnels cut through the solid rock on the northern abutment. Two great concrete and steel bridges span the spillways, each 200 feet long. Across the top of the dam is a smooth roadway 20 feet wide, with a five-foot parapet wall on either side. At night the whole structure is outlined in electric lights, the power being generated by the water in its passage through the system.

The roadway crossing the dam leads north

into the Bayson country, where are to be found a great natural bridge and ruins of ancient cities that are little known. The lake created by the dam fills the Tonto basin, known in Indian days as the Bloody basin, the home of the Apaches, and later the rendezvous for cattle rustlers. All now is peace. The Apache is now a laborer on the great highway over which the dam is reached. The cattle man is a breeder of splendid stock. He has thoroughbred animals secured in the best eastern and foreign prize rings.

The road to the south skirts the lower arm of the great lake and traverses another interesting mountain range that extends into the famous White mountains. In these mountains are camping places that will appeal to the most ardent lover of nature undefiled—fishing in cool, sparkling streams fed from snow banks; hunting over

a rough country that is the haunt of the wild turkey, bear, deer, quail, grouse and other furred and feathered game. The automobile can with ease reach the camping places, and a little ride brings the camper again into the busy business places.

Through Arizona in all directions there are good roads for automobile travel. In the northern part of the state the ways are naturally good, requiring little other than attention, and proper grading and drainage. The material at hand is the best. Dividing the north and south portions of the state into two distinct sections is a range of hills running east and west. The hills are not difficult to negotiate and there are two or three roads across the range. Work, and hard work, is being spent to make these passable and easy.

Before many weeks they will compare with the good roads which prevail in the north.

In the southern portion of the state the same general conditions prevail. Good road making material abounds. The chief requisite is labor and drainage. Distances are great and the funds of the different counties must be expended over a large number of miles. It is surprising what favorable conditions have been secured through co-operation. Communities help repair their part of the main highways; one county will assist another in the construction of bridges and inter-county systems. To what size these counties in Arizona reach will be realized when it is remembered that Maricopa county, which is not the largest in Arizona, covers 7500 square miles, being equal in area to Massachusetts. It is more than equal to the area of the two states of Connecticut and Rhode Island combined.

in the new state and one that is gaining in favor every day. Whatever plan for an ocean-to-ocean highway is indorsed by the federal government, it is safe to say that it will pass through Arizona. Unquestionably, the first road across the continent will be one that can be used the whole year, and not one that will be "weather bound" for several months out of every 12. The line of any road that will be in use every month of the year must be through Arizona, and through the Salt river valley.

### **METZ VICTORIOUS ABROAD.**

**Glidden Trophy Winner Wins Similar Honors in Recent Australian Trials.**

The Metz Company, Waltham, Mass., has received word that one of its Metz cars received a

**Typical Automobile Drive in Arizona, with Fruit Trees Lining the Way on Either Side and the Mountains in the Distance.**

Logging of roads and the publishing of such logs or maps has been completed, and the result is a book of road maps that is a great credit to the state. Good roads days have been held in different sections, at which times whole families get out into the country and help put in shape the main thoroughfares. Interstate tours have been arranged, and tours in the state with large numbers of cars in line have been featured very successfully. Convict labor is being used to some extent and a concrete bridge is now being erected across the Salt river near Phoenix by state prisoners.

Arizona has a large and vigorous body of commercial organizations, several of which have for their sole purpose the encouragement of road construction. "Good roads" is a popular slogan

perfect score in the recent Sydney-Melbourne reliability trials in Australia. There were 24 entries, of which 21 started and 19 finished. Only nine secured full points for reliability.

The Melbourne Age in reporting the event said: "The outstanding feature of the trials was the performance of the little Metz car, weighing less than any other, which ran through the four days without losing a mark or having a puncture."

Aug. 20-21 were set aside by Gov. E. W. Major of Missouri as good roads days, the governor and every male person in the state contributing two days of work on the highways. Similar action has been taken by the governors of Kansas and Arkansas.

# CHARACTERISTICS OF HEAVY FUELS.

## Outlining Some of the Difficulties Attendant upon the Use of the Heavy Distillates of Petroleum in the Variable Speed Motor.

THE rise in the price of motor fuel during the latter part of 1912 and early in 1913 was viewed with alarm by motorists and those utiliz-

control, involves factors other than starting a cold motor and vaporizing the fuel. Those familiar with the basic principles of the gasoline engine know that the power impulse is the result of chemical action or combination between differing elements; that by suitably proportioning the fuel to the air an efficient combustion is obtained. The effects of too much or too little air in proportion to the fuel vapor are also known. If it is possible to construct a gasoline carburetor adaptable to an engine having a wide range of piston speed as in driving a car from five to 50 miles an hour the question naturally arises as to why heavy fuels cannot be utilized in a perfected carburetor, plus an effective vaporizer, with the same degree of success.

It is very obvious from general principles obtaining in nature that where a body is turned from one state to another, as from a solid to a liquid, or from a liquid to a gas, a certain amount of interchange of heat must take place, and the amount of heat absorbed is, of course, in proportion to the latent heat of the body. In the case of a liquid, such as petroleum spirit, which is of a complex nature, it is assumed that its latent heat of evaporation is of the order of 160 calories a kilogram, equal to 288 British thermal units a pound of fuel evaporated. That is to say, every pound of liquid passed through the carburetor requires an addition of heat equal to 288 British thermal units in order to evaporate it so that the resulting mixture shall remain at the same temperature as the external air. This does not signify

†Chief constituents of motor spirit. \*And onwards chief constituents of kerosene.

ing internal combustion engines. In commenting on the situation the press and trade publications called attention to the increasing demand for gasoline, and predicted the use of heavy fuels, kerosene being most generally favored because of the fact that the products due to the distillation of crude petroleum yield approximately from 40 to 50 per cent., depending upon the richness of the crude, method of refining, etc. It was generally expected by the motoring public that the problems involved in the utilization of kerosene in the automobile motor would be solved speedily. But despite the fact that nearly nine months have elapsed since the price of fuel was practically doubled, the number of heavy fuel devices placed on the market is disappointing to those who looked to these for relief from the high cost of gasoline. Specific data as to the performances of the carburetors and vaporizers, or records of official tests, are not available, but it appears that at least one designer has produced a successful type in that the 1914 announcement of one car manufacturer specifies a kerosene carburetor as optional equipment.

The limited number of heavy fuel carburetors would seem to indicate that designers are confronted with problems not existent in carbureting gasoline, and that the construction of a device which will provide an efficient mixture under the variable speed and load conditions prevalent in the four-cycle engine, for instance, with throttle

how the heat is applied so long as the temperature of the resulting mixture remains what is desired. Theoretically, it is assumed that it is more suitable for the temperature of the incoming mixture to be as low as consistent and have the liquid remain in the evaporated or suspended state without precipitation.

#### Characteristics of Fuels.

The characteristic properties of fuels are shown in accompanying tables. It will be seen that the composition of motor fuels of the petroleum series of hydrocarbons, table 1, are somewhat complex, but the proportion of the lightest constituents is such that they are sufficient under ordinary circumstances to effect a fair proportion of the necessary carburetion when the air is cold. As it is better to vaporize the liquid completely before introducing it into the engine, the quantity of air supplied depends both on the composition of the fuel and on its vapor pressure and temperature.

The latent heat of vaporization lowers the temperature during carburetion, thus lowering the vapor pressure, and external heating must be resorted to in order to convert the suspended particles of fuel into a vapor and prevent their precipitation in liquid form. The vapor pressures of complex fuels depend chiefly upon that of their most volatile constituents, even though the proportion of these to the total mass of fuel is small. When air is admitted to the presence of such fuels, selective evaporation undoubtedly takes place; that is, the more volatile fractions are first taken up, leaving the heavier behind. When fuel is injected or sprayed into an air stream, selection affects the homogeneity of the mixture.

Redwood gives the figures presented below, showing the proportion of hydrocarbon vapor which air will take up, but these vary according to the volatility of the fuel, pressure, humidity and temperature of the atmosphere. For example, dry air will take up the following quantities of vapor from gasoline having a specific gravity of .65 before the air is saturated:

|      |                              |
|------|------------------------------|
| 10.7 | per cent. by volume at 32° F |
| 17.5 | " " " " 50° F                |
| 27.0 | " " " " 68° F                |

These percentages are equivalent to one volume of vapor to 5.7 of air at 50 degrees and one volume to 3.7 at 68 degrees Fahrenheit, showing that a small increase in the temperature largely increases the percentage of gasoline vapor which can be retained by the air.

#### Absorption of Fuels by Air.

Gasoline of a specific gravity of .70 containing 83.72 per cent. carbon and 16.28 per cent. hydrogen, has a vapor density of .24 pounds a cubic foot at atmospheric pressure, when at a temperature of 32 degrees Fahrenheit, or nearly three times the density of air. In another form the amount of liquid fuel which can be absorbed by 100 volumes of air at a temperature of 60 degrees Fahrenheit varies with the density of liquid as follows:

TABLE 4.

| Specific gravity<br>of liquid fuel | Percentage<br>of liquid<br>air by volume |
|------------------------------------|--|
| .639                               | .59                                      |
| .679                               | .18                                      |
| .700                               | .17                                      |

As is shown by the accompanying tables, the nature of the fuel is very complex, consisting as it does of a considerable variety of the methane series, containing various percentages of unsaturated hydrocarbons. The specific gravities of these various fractions give some indication as to their behavior as regards evaporation, for it will be noted in table 2 that pentane and hexane exist principally in those fractions the specific gravity of which is below .666, heptane then follows up to .698 and octane at .715.

The heavier hydrocarbons represented by nonane and decane appear with a specific gravity from .726 to .749, and these are largely present in commercial motor fuels in use at the present time. The significance of these constituents lies in the amount of air necessary to effect carburetion, and the minimum temperatures at which mixtures of air and fuel can exist when the fuel can remain as vapor without precipitation in the form of liquid particles. By referring to table 5, it will be seen that there is a large range of temperatures between which the various fractions under consideration can be used in a carburetor with success.

It will be noted that as the density of the fuel increases through the series, the drop of temperature upon vaporization also decreases, and that outside the methane series, a greatly increased addition of heat is necessary. By referring to table 4 it will be seen that as the density of the fuel increases, a smaller proportion of fuel to air is required to produce a maximum explosive effort. One authority holds that this is almost self-governing in a gasoline carburetor system, for as the density of the fuel increases, in the petroleum series, its viscosity also increases, so that the amount of fuel of a greater density which flows through a given orifice very nearly adjusts itself in accordance with the requirements. In other words, if a gallon of fuel contains a greater number of thermal units on account of its density, it takes a longer time to flow through a given orifice than a gallon of fuel containing a lesser number of thermal units.

#### **Flow of Liquid Fuels.**

The prime factors to be considered in determining the quantity of liquid fuel that will flow through a carburetor or jet orifice are: The viscosity of the fuel, its temperature, shape of the orifice and the effective head actuating at the orifice. Viscosity and temperature of the fuel bear a certain relation to each other, as the higher the temperature the lower will be the viscosity, and a greater volume will flow through an orifice in unit time as the temperature is increased. If radiation or conduction of heat from the engine is allowed to influence the float chamber and the fuel contained therein, an increase of fuel supply will result as the heat of the motor increases. In considering the effect of temperature upon the viscosity of the fuel, an increase of 20 per cent. of fuel flow may occur when the carburetor is hot as compared with the fuel flow when the instrument is cold. When the regulation is perfect before the engine has attained working conditions of temperature the mixture will be too rich for normal running.

Reference has been made to vapor pressure, a subject which has not received much attention in carburetor designing, because it has not been made use of in many instances. It is useful to know that the vapor pressure increases with the temperature, and naturally, with the richness of the mixture when working near the saturation point. In one instrument this property of vapor is utilized to govern the discharge of the fuel from the jet orifice, the jet itself discharging into a tube, and as the mixture tends to become enriched under high suction of the engine, the jet tends to give an increased coefficient of discharge, accompanied by a tendency toward increased vapor pressures within the tube.

The writer has endeavored to show the characteristic properties of fuels and the minimum temperatures at which mixtures of fuel and air can exist without precipitation in the form of liquid particles. This precipitation or condensation is an important factor in the use of heavy fuels in the automobile engine, as will be pointed out in logical sequence.

#### **Possibilities of Kerosene.**

In considering the possibility of kerosene as a motor fuel, the idea that its vapor cannot be ignited as easily as that of gasoline is erroneous. Produce a true vapor and maintain it up to the time of its ignition by the spark, and the resulting combustion will be satisfactory. Kerosene being less volatile than gasoline at ordinary temperatures and pressures, that is, does not vaporize as readily, requires a larger supply of heat. Early designers of kerosene carburetors believed that its use involved only the application of heat to the gasoline carburetor, and while it is admitted that an automobile engine which has been operated long enough to have attained an average operating temperature can be made to continue on a kerosene and air mixture, its capacity is apt to be more or less uncertain.

When used in an ordinary carburetor, the liquid jet is carried satisfactorily by the air, as is the gasoline jet, but it is not as readily vaporized, and a certain amount will enter the cylinder as a liquid or be deposited in the intake pipe. Part of the mixture entering the cylinder as liquid will generally remain as such until combustion has begun. When this takes place, the high temperature tends to vaporize the liquid, and another process known as "cracking" occurs simultaneously. Cracking consists of the breaking up of the molecules of the liquid kerosene, some of the resultant products being finely divided carbon and heavy viscous liquids. The more the kerosene is broken up, that is, the more perfectly it is atomized or sprayed into the air, the less op-

portunity for the collection of the liquid on solid surfaces and the more rapid will be the vaporization within the cylinder of the engine.

Fig. 1—Illustrating the Volatility of Gasoline Above and Below the Combustible Nature of Petroleum.

At Fig. 1 is presented digrammatically the volatility of gasoline above and the condensable nature of petroleum. A particle of gasoline projected from a spray nozzle automatically opens out as vapor as it proceeds in the direction of the arrow, from left to right. The volume of petroleum vapor on the other hand closes in automatically to final condensation, as indicated. By this is not meant that gasoline is volatile and that kerosene condenses. It merely emphasizes the fundamental distinction between the two fuels.

The construction of a kerosene or heavy fuel device for an engine having a constant load and operating at a constant speed is not difficult, because a certain amount of heat is required each engine working stroke, and the load also being constant, the quality of the spraying may be comparatively poor if the walls are not above a certain temperature. With the heat of the exhaust utilized, and this being constant, the work of construction is greatly simplified. But if the load or speed be considerably varied, trouble is experienced.

#### Effect of Varying Control.

From the above it may be inferred that the varying of control with a four-cycle motor, throttle controlled, has an effect upon the mixture within the cylinder walls, and that the proportion of air to the fuel is not the chief difficulty attendant upon the use of heavy fuels. The result of varying throttle control is to vary the amount of the charge and the compression. To vary the compression is to vary the temperature of compression, and it is held that the ultimate result is to vary vaporizer temperature; or in other words, the heat of the compressed charge is raised or lowered, correspondingly. In these two factors, varied air influx to motor and varying tempera-

ture of compression, are held to be two sources of trouble to the inventor of the heavy fuel carburetor. The variation of air flow is primarily one of velocity, and it has but little effect on an engine running on a fixed amount of gas.

#### Air Velocity a Factor.

The immediate difficulty with variable air velocity is the change that results in the quality of the spray, when piston speed falls as suggested in the diagram at Fig. 2, where the size of the spray particles is shown approximately corresponding to the air velocity (proportionate to the length of the arrows), the increase of blast power more effectively pulverizing the fuel. To remedy this there may be provided what amounts to a variable choke tube, whereby, as the engine speed varies, so will the area of the air inlet be raised, but other factors may be affected. In the gasoline carburetor a taper needle valve is so connected to the air valve that, as the engine suction increases, the amount of fuel and air is increased, maintaining approximately constant proportions of gasoline and air at all motor speeds.

In designs for heavy fuel devices not only must proportionate mixture be considered, but the character of the spray, since spray as such (liquid fuel in droplets) is to be assumed one of the principal causes of smoky exhaust. Variation of the spray, that is, variation in the degree of fineness to which the fuel is broken up, is an important factor in the construction and operation of the spraying type of carburetor employing heavy fuels. It is held by one authority that degeneration in the character of the oil spray attends reduced piston speed velocity; that the result of varied air influx, the resultant of varying speed originated by varying load, is starving

Fig. 2—Change Resulting in Quality of Spray Due to Variable Air Velocity.

the engine by reason of the incombustible nature of the feed that has degenerated from a mist to a form of coarse spray.

It may be argued that some of the variable speed running conditions exist in the use of gasoline, and while this is admitted, for some not easily determinable reason, the coarse spray of gasoline does not produce the same visible exhaust as does the same condition with heavy fuels. The overloaded, slowed down gasoline motor does not produce smoke unless the fuel is greatly in excess, although odor is noticeable. In explanation, it may be stated that what produces smell in one case produces that plus smoke in another. It may be that coarse gasoline spray readily turns into vapor, and that the exhaust is vaporous, whereas with heavy fuel being condensable, particles issue from the motor not fully burned.

It will be seen that three factors are to be considered in the successful utilization of heavy fuel: First, effective pulverization; second, complete combustion; third, a high state of carburetion—mixing of air and combustible.

#### **To Be Continued.**

Ed. Note—The next installment will deal with the methods employed in preparing heavy fuels, such as kerosene, etc., for combustion in an engine.

### **TO DISCONTINUE PRODUCTION.**

#### **Maker of Alco Cars and Trucks Decides to Retire from the Industry.**

Not in years has the industry experienced a greater surprise than was occasioned when the American Locomotive Company, New York City and Providence, R. I., maker of Alco pleasure cars and motor trucks, announced its decision to discontinue the automobile department of its business, in the following statement issued from the New York office, which is located at 1886 Broadway.

The board of directors of this company, at a meeting held on Aug. 13, 1913, decided to discontinue the manufacture and sale of automobiles and motor trucks. The company takes this opportunity to assure all owners of Alco vehicles that arrangements will be made to furnish them with repair parts for a period of not less than five years to come, and, further, that it will fulfill in every respect its obligations given under guarantee to its customers.

AMERICAN LOCOMOTIVE COMPANY.

W. H. Marshall, President.

It is understood that the automobile department has not been as profitable as the other line in which the company is engaged, although the Alco car is one of the highest priced in America, selling at \$6000. The company began the manufacture of Alco automobiles in 1906, when the machine was known as the American Berliet, the

American rights to the Berliet patents having been secured. The plant at Providence, R. I., with its equipment, is valued at \$3,000,000. Nearly as much more capital is invested in branches and service stations in various parts of the country. In the absence of additional information the ultimate disposal of these properties is a matter of conjecture only.

### **NEW BOSCH BRANCH.**

#### **All Distributors East of Mississippi to Be Handled from New York City.**

A New York branch of the Bosch Magneto Company, New York City, has been organized for the purpose of giving undivided attention to the increasing number of Bosch users in its territory. The details of operations previously carried on by the executive officers and staff are now taken care of by the new branch, in a field known as the eastern territory, made up of all the states east of the Ohio and Mississippi rivers.

Space in the Bosch building, 223 West 46th street, New York City, has been temporarily made over to the new branch, where its activities will be carried on until the growing needs of the executive and main office forces, or the normal increase of its own needs shall make it necessary to find new quarters. The branch is in charge of Alfred J. Poole, formerly assistant chief engineer, who has an adequate corps of assistants.

### **ELGIN ROAD RACES.**

#### **Twenty-One Entrants for Chicago Automobile Club and Elgin National Trophies.**

Only two events are scheduled for the fourth annual Elgin road race meet, to be held at Elgin, Ill., Aug. 29-30, under the auspices of the Chicago Automobile Club and Elgin Automobile Road Race Association. Twenty-one machines have been nominated, eight for the contest for the Chicago Automobile Club trophy, formerly the Cobe cup, on Friday, and 13 for the Elgin National trophy, now held by Ralph DePalma, in a Mercedes, on Saturday. Each race will be for 305 miles. The cars and drivers are:

Chicago Automobile Club trophy—Mercer, DePalma; Mercer, Wishart; Mason, Mulford; Mason, Rickenbacher; Nyberg, Madden; Case, W. Endicott; Special, M. Roberts; Deltal, Dawson. Elgin National trophy—Marmon, Dawson; Isotta, Grant; Mercer, DePalma; Mercer, Wishart; Mason, Haupt; Mason, Rickenbacher; Stutz, Anderson; Erwin special, Bergdoll; Case, W. Endicott; Tulsa, Hughes; Nyberg, H. Endicott; Keeton, Burman; Deltal, not named.

### STEWART POWER AIR PUMP.

#### Stewart-Warner Speedometer Corporation Announces Compact Four-Cylinder Unit.

The Stewart-Warner Speedometer Corporation, Chicago, announces a four-cylinder air pump designed for inflating tires and for compressed air motor starters. It is made in two models, air and water-cooled, and although primarily designed to be driven by the motor, is also furnished with a crank handle, permitting of mounting on the running board and being operated by hand.

The pump is very compact, being eight inches high, 7.5 long and four wide, and resembles an automobile motor in appearance. It is built similar to a four-cylinder gasoline engine and is fitted with a drop forged crankshaft ground to size,

**Stewart Four-Cylinder Air Pump, Built Like an Automobile Motor and Having Four Impulses to Each Revolution of the Crankshaft.**

metal pistons, piston rings, connecting rods, splash lubrication, etc. The construction of the pump is shown in an accompanying illustration, and it will be noted that the air is admitted to the cylinders through apertures in the cylinder walls just above the piston head and when the piston is in its lowest possible position. The air intake is screened to prevent entrance of foreign elements. The valve in the head is ground to a perfect seat and retained by a strong tension spring. The passage of the air to the outlet at A is shown in the illustration by arrows.

The cylinders have a bore of 1.4375 inches and stroke of 1.125. The connecting rods are drop forged and heat treated. They are driven by means of eccentrics working within the lower ring on the connecting rod, a design eliminating

a large number of parts. These rings are fitted carefully to prevent the lubricant from working into the compression space, but as a precaution each pump is fitted with a separator located on the pipe line just above the connection of the pipe line with the pump. The water-cooled unit is provided with unions C C for connecting with the circulating systems of the motor, and four holes drilled in the base of the pump provide easy means for installing.

Unlike the automobile engine, the Stewart is productive of four compression impulses with each revolution of the crankshaft, insuring a continuous and steady flow of atmosphere to the tire or air tank. At a speed of 500 revolutions a minute this means 2000 impulses. A high grade pressure gauge is supplied with each pump, also 10 feet of hose and all necessary connections.

### STUDEBAKER INSTALLS PARTS PLANT.

#### Move Insures Adequate Supply of Parts for Former Models at All Times.

By placing at the disposal of its service department an entire plant, completely equipped with machinery and able to turn out on short notice parts for every model of its cars now in the hands of the public, the Studebaker Corporation, Detroit, maker of Studebaker cars, has taken an advanced step in what it believes to be the ideal relationship between manufacturer and the owners of and dealers in its machines.

The plant purchased by the company is at Pontiac, Mich., and was formerly known as the Vulcan Gear Works. Aside from insuring a permanent supply of parts for all Studebaker models, an additional advantage lies in the ability to turn out for each Studebaker dealer a stock of parts fitted to the needs of his territory, thus permitting him to install immediate repairs on any Studebaker vehicle.

It is of interest to note that 97 of the 98 entrants in the recent French military trials for trucks and tractors were mounted on rubber tires. These trials are held each year under the auspices of the war department for the purpose of determining the vehicles which shall be eligible for government subsidy for military purposes. The preferences of French manufacturers in the matter of tires this year indicated a decided triumph for the Gaulois make, represented in this country by the Gaulois Tire Corporation, 1926 Broadway, New York City, these being fitted to 78 per cent. of the vehicles entered.

**TRAFFIC COMMITTEE APPOINTED.****International Travel Club Announces Personnel of Important Board.**

As was announced in a recent issue of The Automobile Journal, the International Travel Club, meeting in New York City, decided to proceed at once toward the formation of a committee to take up the matter of uniform traffic regulations in the larger cities. This committee has been appointed as follows: Chairman, Charles Jerome Edwards, Brooklyn, N. Y.; vice chairman, William Phelps Eno, New York City and Washington; Howard Elliott, St. Paul, Minn.; Julius P. Meyer, New York City; Edward G. Connette, Buffalo, N. Y.; David Beecroft, Chicago; Charles Henry Davis, South Yarmouth, Mass.; Samuel Walter Taylor, New York City; Carl H. Page, New York City; Albert S. Callan, Chatham, N. Y.; Burns Lyman Smith, Syracuse, N. Y.; Robert Lee Morrell, New York City; Frederick H. Elliott, secretary of the club.

The personnel of this committee is composed of men who have given much thought to this and kindred subjects. Mr. Edwards is a well-known traveller and has been an executive in many clubs. He is at present prominent in the insurance world as manager of the Equitable Life Assurance Society. Mr. Eno is the author of the traffic regulations now in use in several American cities, London and Paris. Mr. Meyer is director of the Hamburg-American Line. Mr. Connette formerly was chief engineer of the public service commission, first district, State of New York, and is now president of the International Railway Company. Mr. Beecroft is a well-known automobile editor. Mr. Davis is president of the National Highways Association, and is actively engaged in an extensive campaign in behalf of the good roads movement. Mr. Taylor is editor of *Rider and Driver*, and is a member of the New York state commission to confer with commissions from other states on uniform motoring laws. Mr. Page is widely known as an automobile distributor. Mr. Callan is the author of the so-called Callan automobile law in New York. Mr. Smith is an enthusiastic traveller and is connected with the typewriter industry in Syracuse. Mr. Morrell has been prominently identified with motoring and good roads for a number of years, and only recently was appointed chairman of the law and ordinance committee of the Manhattan Automobile Club. Howard Elliott is president-elect of the New York, New Haven & Hartford Railroad, and Frederick Elliott has been closely

identified with the motoring department in New York State and with numerous automobile organizations.

**NEW EDISON BATTERY.****Cell Designed for Use in Pleasure Cars and Light Delivery Wagons.**

The Edison Storage Battery Company, Lakeside avenue, Orange, N. J., has brought out a new type A-5 nickel-iron alkaline cell, with rated capacity of 187.5 ampere-hours, intermediate between type A-4, 150 ampere-hours, and type A-6, 225 ampere-hours. The new battery is designed for pleasure cars, for 1000-pound delivery wagons, for industrial and baggage trucks, and for similar light work where the type A-6 has proved to be more than sufficient.

It is maintained by the company that in the type A-5 Edison battery there is a "springiness" and feeling of power given to the control that is

particularly pleasing to the operator. Like the other Edison vehicle batteries, it carries a guarantee that it will be

The New Type A-5 Edison Cells in a Tray.

capable of developing its full rated capacity at the end of four years. The general terms of this guarantee require simply that evaporation of the electrolyte be replaced by distilled water to keep the plates covered; that every eight months or so the electrolyte—a solution of potassium hydrate with a little lithium hydrate—be renewed, and that the cells be kept reasonably clean.

As is more or less well known, it is held that the Edison battery is not injured by occasional high rates of discharge, that it may be left "on charge" indefinitely, and that it may even be put on charge in reverse direction without harm. The container, grids, poles, etc., are all made of heavily nickel plated steel, and it is said to be practically impossible to damage any part of the cell by falls, jars or collisions. The accompanying illustration presents the new battery and tray.

## DETAILS OF PARTIN-PALMER "38" TOURING CAR.

**I**T IS contended by some that there is to be little that is new in the constructional features of new models; that is, that aside from minor changes and refinements, in the main the same mechanical details are to be continued in the 1914 product. This does not apply to the Partin-Palmer "38," a popular priced six-passenger touring car produced by the Partin Manufacturing Company, Chicago, with a factory at Detroit. Details of the recent Partin-Palmer combination were announced in the issue of *The Automobile Journal* for July 25.

The most striking feature of the new chassis is the motor, presenting as it does, a novel application of principles endorsed by sound engineering practise. As will be noted by the accom-

pounds to the square inch. The valves are carried without cages and the rocker arms generally utilized are eliminated by forming the valve seats directly in the head. The valves have a port diameter of 1.375 inches, the intake being located on the left hand side and the exhaust on the right. The enclosed feature is obtained by the core method. The valve guides are of gray iron and the adjustable tappets are of steel, hardened and ground. They are actuated by drop forged camshaft, having integral cams and rotating in three large bearings.

The crankshaft is a 40 point carbon steel, drop forged and carefully ground. Three bearings are utilized, these being stepped, and as follows: Front, two inches; centre, 2.109375; rear,

**Partin-Palmer, a Six-Passenger Touring Car Having a Well Designed Chassis and Motor of Ample Capacity.**

panying illustrations of the intake and exhaust sides of the power plant, the designer has obtained a valve-in-the-head construction and fully enclosed these members, a design making for high efficiency, as well as noiseless operation. The cylinders are cast en bloc with the upper half of the crankcase, and the cylinder head is removable, a practise that is gaining adherents among makers of motors of the block type, and one making for rigidity, as well as eliminating the joint at the base of the cylinders. The design also makes for simplicity in that the number of parts is reduced. Accessibility is another factor, the work of removing carbon deposits and the inspection of valves, etc., being simplified.

The head is secured to the cylinder casting by bolts, the joint being made with copper asbestos rings, having a pressure resistance of over 3000

2.140525. The lengths are three, 2.5 and 3.6875 inches, respectively. The bearing material is a special alloy. The dimensions insure uniform strength throughout. The connecting rods are drop forged, the dimensions of the large end being 2.625 by 1.75 inches, those of the smaller end 2.25 by one inch. The pistons are carefully ground to size and carry three eccentric rings above the wristpin, which is a seamless steel tube of carbon steel, hardened and ground. They oscillate in piston bosses. The crankcase is divided at the centre, the lower section being of pressed steel. The timing gears are spiral, enclosed by the conventional housing at the front.

The method of cooling employed should make for great efficiency in operation. Both the intake and exhaust passages are cast in the head section, which is thoroughly cooled by the liberal sized

Side View of Partin-Palmer "38" Chassis, Showing Frame Construction, Making for a Low Centre of Gravity.

water jackets. The water jacketing of the exhaust is a feature and should minimize back pressure by the cooling of the exhaust gases, which are led to a single port, thence through a large diameter straight outlet to the tube connecting with the muffler. In keeping with the simple design is the bolting of the outlet water manifold, having a two-inch diameter, to the head, and the inlet to the cylinder casting, a construction permitting of the displacement of the head without disturbing the radiator. Cooling is by thermo-syphon, the method of casting the cylinder and head being very favorable to this system. The radiator is of the vertical tube type, with Mercedes front, having sufficient capacity to maintain the fluid at the proper temperature under all conditions of service. Cooling is further aided by a six-bladed, pressed steel, ball bearing fan, driven by a flat belt and having a vertical slide adjustment.

Carburetion is by a double jet Stromberg, located on the left hand side of the motor, and provision is made for heating. The capacity of the fuel container located under the front seat is 14 gallons, and an auxiliary tank is fitted under the hood, an arrangement making it possible to surmount steep grades with a gravity system.

A constant level splash and circulation system of lubrication is employed, a gear driven pump actuated by the magneto shaft drawing the lubricant from the reservoir in the crankcase and forcing it through the dash sight feed, thence to the oil troughs. Distribution is so arranged that the level is constant regardless of road conditions. The capacity of the reservoir is 1.25 gallons and means are provided for

noting the supply of lubricant.

Ignition is by the Briggs dual system, the magneto being located on the right hand side of the motor and driven through a gear actuating the fan pulley. The system also includes six dry cells, a kick switch and non-vibrating coil, and a locking device. One set of spark plugs is utilized, these being in the cylinder head. The clutch is a leather faced cone, 15.75 inches in diameter, with eight adjustable springs, making for easy en-

gagement. Drive is through a Spicer universal joint back of the clutch and inside the torque tube ball to a nickel steel shaft 1.125 inches in diameter.

The transmission is located amidships, and is of the selective type, providing the conventional three forward speeds and reverse, with direct drive on the third. The rear axle is of the three-quarter floating type, and energy is imparted to the road wheels through bevel gear to 1.125-inch nickel steel shafts enclosed in seamless steel tubing. The differential housing is malleable iron, and a large sized inspection plate is provided. Hyatt high duty bearings are employed throughout. The construction of the rear axle is sturdy in every particular.

The frame is of carbon steel, .15625 inches thick and with a depth of channel section of 4.5 inches. The width of section varies from 1.5 inches minimum to three inches maximum, and the frame is inswept at the front, providing a short turning radius. A low centre of gravity is assured by the usual drop. Three cross members are employed.

The front springs are semi-elliptic, 37 inches long and two wide, while the rear members are

Plan View of Partin-Palmer Chassis, Illustrating Simplicity of Design and Accessibility of Components.

three-quarter elliptic, with full quarter, 48 inches long and two wide. The material is oil treated steel, ground and polished, and self-lubricating

**Valve Side of Partin-Palmer Motor Having Novel Features, Including Overhead and Enclosed Valves, Removable Cylinder Head, Etc.**

bolts of ample dimensions are utilized.

The front axle is a drop forging of the I beam section type, having a depth of 2.5 inches and width of 1.5. The arms, knuckles and spindles are drop forged and the last named are large, insuring an ample factor of safety. The steering gear is of the worm and wheel type, and the column is set at 45 degrees and surmounted by an 18-inch wheel. Lubrication is by conveniently located grease cups. The spark and throttle levers are mounted in the usual manner. The maker calls attention to the steering wheel, stating that its position and arrangement of the front seat permit of the driver leaving and entering the car without difficulty.

The speed change lever is located in the centre at the right of the operator, who is seated at the left. The rocking type of lever is employed in a rectangular slot. The emergency brake lever is placed at the left. The clutch pedal is at the left, with service brake at right, with the usual accelerator between the pedals. Two sets of brakes are provided, both being of the internal expanding design. Both drums are turned to diameter after being bolted to the wheel, the service drum being 14 inches in diameter, with two-inch face, that of the emergency 10 inches diameter with 1.75-inch face. Both sets are equalized and easily adjusted for wear.

The wheels are of the artillery type, of carefully selected wood, and have 12 spokes. Good-year quick detachable, quick demountable rims with Goodyear 32 by 3.5-inch shoes are fitted as standard, although option is given of 33 by four-inch tires at the actual difference in cost. The

wheelbase is 115 inches, tread, standard, 56.

The body is aluminoid steel over a wooden frame, and ample room is provided for six passengers. Two auxiliary seats are fitted, these being 15 inches wide and measuring 14 inches from front to back. These have automatic catches for holding the legs when in service, and when not employed the entire assembly folds back under the front seat, out of the way. All doors are 20 inches wide, making for easy entrance and exit.

The upholstery is high grade and the cushions are deep and comfortable. The front cushions are 17 inches deep, while the rear is 19. The fenders harmonize with the attractive body lines, and the usual splash aprons are fitted, fully protecting the occupants from mud, etc. The body is painted blue black, with gray gear, and the fenders and hood are enamelled black.

Although gas and oil lamps are fitted as standard equipment, the company is prepared to install the Auto-Lite electric lighting and motor starting system at a very low cost. It can be fitted before or after purchase at option of the buyer.

The equipment of the Partin-Palmer includes a four-bow mohair top and envelope, enclosed curtains, clear and rain vision windshield, Stewart speedometer, Prest-o-Lite gas tank, black enamelled and nickel lamps, extra rim, rear tire irons, robe and foot rails, repair kit, tools, jack, horn, pump, etc.

Although the Partin-Palmer motor is rated at 38 horsepower at 2200 revolutions a minute, it is stated that it has developed considerably in ex-

**Intake Side of Partin-Palmer Motor, Showing Cylinders Cast En Bloc with Crankcase, Cone Clutch and Method of Suspension.**

cess of this in tests. This coupled with the extreme light weight provides ample power to meet all requirements of service.

## CONCERNING GOOD ROADS MATTERS.

**B**ECAUSE of the present widespread interest in good roads, it is anticipated that the third American road congress, which will be held in Detroit, Sept. 29-Oct. 4, will be one of the most largely attended meetings of this character that has been arranged in this country. The congress is to be held under the joint auspices of the American Highway Association, the American Automobile Association and the Michigan State Good Roads Association. The day's sessions will be held on the second floor of the Wayne Gardens, while the evening sessions and special meetings of the various organizations which will take part, will be held in the Hotel Pontchartrain and other hotels. A partial list of the papers which will be presented follows:

"The Labor Problem in Road Construction," Capt. P. St. J. Wilson, state highway commissioner for Virginia; discussion opened by W. E. Atkinson, state highway engineer for Louisiana.

"Systematizing the Purchase of Road Materials and Equipment," Henry G. Shirley, chief engineer state roads commission for Maryland.

"Unsurfaced Roads," W. S. Keller, state highway engineer for Alabama; discussion opened by George W. Cooley, state highway engineer for Minnesota.

"Gravel Roads, Their Construction, Maintenance, Cost and Special Treatment," Hon. S. Percy Hooker, state superintendent of highways for New Hampshire; discussion opened by H. L. Bowlby, state highway engineer for Oregon.

"Treatment of Worn Out and Ravelled Macadam Surfaces," Col. E. A. Stevens, state highway commissioner for New Jersey; discussion opened by Hon. Robert C. Terrell, state commissioner of public roads for Kentucky.

"Bituminous Macadam, Construction and Maintenance," S. D. Foster, chief engineer, state highway department of Pennsylvania; discussion opened by W. A. McLean, provincial engineer for Ontario, Canada.

"Brick Roads," James M. McCleary, county engineer for Cuyahoga county, Ohio; discussion opened by R. Keith Compton, chairman, paving commission, Baltimore, Md.

"Concrete Roads," Hon. Frank F. Rogers, state highway commissioner for Michigan; discussion opened by Paul D. Sargent, state highway engineer for Maine.

"Selection of Materials," Hon. Logan Waller Page, director, United States office of public roads.

"Drainage Structures," A. R. Hirst, state highway engineer for Wisconsin; discussion opened by Prof. T. H. MacDonald, state highway engineer for Iowa.

"California's \$18,000,000 State Highway System," A. B. Fletcher, state highway engineer for California.

"The Organization and Management of Working Forces," A. N. Johnson, state highway engineer for Illinois.

"Contract Law," William Bowman, New York City.

"The Protection and Upkeep of Road Equipment," Daniel J. Hauer, New York City.

"The Merit System in Road Management," Hon. J. A. McIlhenny, president, United States civil service commission.

"Financing Road Improvement," William G. Edens, president, Illinois Highway Improvement Association.

"Bond Issues for Road Improvement," S. E. Bradt, vice president, First National Bank, DeKalb, Ill.

"The International Congress and the Roads of England, France and Germany," Col. William D. Sohler, chairman, Massachusetts highway commission.

"Economics of Road Improvement," J. E. Pennypacker, secretary, American Highway Association.

"Dirt Roads and Politics," Charles P. Light, formerly state highway commissioner for West Virginia.

In addition to the papers to be presented, of which the above is only a partial list, there will be a comprehensive exhibit of road making materials and machinery, in which a large number of the manufacturers in the country will be represented.

In connection with this announcement, it is of interest to note that the office of information, Department of Agriculture, Washington, D. C., is issuing the following statement, under the head "A Large Part of Road Building Funds Wasted":

The office of public roads of the Department of Agriculture is making a strong effort to focus the mind of the country on the fact that maintenance and effective repair are of equal importance with the actual improvement of bad roads. Investment of money in new roads does not become real economy until provision is made for keeping these new roads in condition after they are built. If a new road was built and then allowed to fall into disrepair, much of the original investment is simply wasted.

Europe, generally speaking, is ahead of the United States in the matter of road improvement, but Great Britain is struggling with a problem similar to the one that confronts the people of the United States. In England, Scotland, and Wales there are no fewer than 2140 separate authorities, who, between them, administer 175,487 miles of roads, or an average of only 82 miles apiece. In Scotland, apart from the big cities, there are over 200 burghs, one-half of which have but 10 miles of road apiece to maintain. Needless to say, such a minute mileage is insufficient to keep the road plant fully occupied all the year around, and renders the employment of a skilled engineer impossible for economical reasons.

Officials of the office of public roads when called upon for assistance by the various states are pointing out that road building is an art based on a science, and that trained men and experienced men are necessary to secure the best results from the expenditure of road funds.

Statisticians have found that although the average expenditure on the improvement of roads exceeds \$1,000,000 a day, a large portion of the money in the United States is wasted because of the failure to build the right type of road to meet the local requirements, or the failure to provide for the continued maintenance of the improvement.

The various states and counties within the past six months have taken a greater interest in road improvement than ever before in the history of the United States, and there is now a strong movement to conserve the roads of the country where they are improved. Scientific maintenance will be one of the chief features of the work of the office of public roads throughout the present year.

The good roads committee of the Automobile Chamber of Commerce, which is now the representative organization of the automobile manufacturers in America, asks the question, "Are Macadam Roads Obsolete?" The question is answered by H. W. Perry, secretary of the committee, in the following manner:

In almost every annual report issued by highway commissioners in the last five years great emphasis has been laid upon the rapid destruction of the roads and the increasingly heavy cost of keeping them in even fair condition. The world famed road system of France is now in such a state that the government has recently appropriated a large sum for a general treatment of the sur-

faces with a tar binder. In both France and England road tarring has been widely practiced for several years. At the first international road congress, held in Paris in 1908, the delegates voiced their opinion that the water-bound macadam roads could not resist the destructive effects of automobile travel, and that if the use of this class of roads was to be continued some better way of binding the broken stone than by the cementing effect of stone dust and water must be adopted. The opinion was expressed that this probably could be effected by the use of tar or asphalt applied to the road surface or incorporated with the stone. In England and France they are spending fully three times as much money a mile for road maintenance as in this country, according to State Highway Commissioner Sohler, of Massachusetts, who recently returned from Europe, where he attended the third road congress and made a study of the foreign roads.

Regarding water-bound roads, the Rhode Island state board of public roads makes this statement in its annual report for 1912:

"We have learned from experience, as all the older states and countries engaged in modern road building have learned, the uselessness of trying to maintain this latter class of roads for any length of time with a smooth and even surface, where the motor vehicle traffic is very great, by the methods heretofore employed."

In support of this opinion the board cites a road that was resurfaced with new "metal" for a distance of four miles in the latter part of 1910 and watered and rolled thoroughly, yet which early in the following season of 1911 developed holes that multiplied to such an extent that they had to be cleaned out, refilled and coated with tar.

Nearly 60 per cent. of the state roads of Massachusetts have been treated with surface applications of bituminous material, or have been built with a tar-macadam surface. "Our commission decided some five years ago," writes Chairman Sohler, "that where there were more than 100 motor cars a day water-bound macadam roads or gravel roads required either oil or tar, or something to prevent their being torn up and ravelled, also that in constructing new roads we should construct more permanent pavement than water-bound macadam, and we have been using both tars and asphalts in the top three or four inches of the road."

During the year 1911 the Massachusetts highway commission spent more than \$500,000 in the maintenance of state highways, of which more than \$300,000 was obtained from automobile fees. Yet in the last annual report the commissioners say:

"It now seems to the commission that a surface coat of asphaltic oil would not prove to be economical or satisfactory on a road which has a large amount of heavy teaming, though it is satisfactory, or has been up to the present time, on roads which have a large amount of high-speed automobile travel, with but few heavily loaded teams."

So after all, it is not automobile travel that does all the damage, although the observations of many road authorities on the subject undoubtedly leave that impression.

While oiling of the roads is effective in laying dust and helping to preserve the surface, if repeated periodically, it does not prevent destruction or very greatly reduce cost of maintenance. A recent inspection of some of the bituminous roads of Rhode Island shows that some of those between Providence, Fall River and Bristol which were surfaced from two to five years ago are in poor condition today and are undergoing resurfacing and extensive patching.

Travel on all state roads throughout the country is increasing at a tremendous ratio, as shown by traffic censuses taken in different places. It is undergoing a great transition, also, and it is apparent to any observer that in the next 10 years the predominating traffic will be motor driven in many states. Yet what is the condition of affairs in highway work as revealed by reports of highway commissions?

During the year 1912 we find that in nine leading states having state highway departments there were built or contracted for 658.75 miles of water-bound roads at an average cost of \$7765, and 1122.5 miles of bituminous macadam at an average cost of \$8948 a mile; also about 200 miles of gravel roads. These may all be designated impermanent roads, because under the probable increase of traffic their surface will not have a life of more than

five to 10 years—probably much less in most cases. As compared with this total of 1981 miles of impermanent roads, the same states built or contracted for a total of only 581 miles of other roads, of which 62.75 were brick at \$14,623 a mile, 114.5 cement concrete at \$7395 a mile, 55.5 asphalt on concrete base at \$16,643 a mile, 6.5 asphalt on macadam and 342 miles of types not designated.

How many miles of the undesignated roads were of permanent construction is not known, but if they were all of this type, there would be only 581 miles of permanent roads, as compared with 3.3 times as many miles of impermanent new macadam.

The states from which the foregoing figures are obtained are Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Maryland, Ohio and California. Other states are much less advanced than these in the matter of permanent road building.

The point it is desired to emphasize is that, while admitting the unsuitability of water-bound macadam to present day traffic conditions, the most advanced states in highway work continue to spend great sums of money in building more such roads, and, while condemning the automobile and motor truck as the most destructive agencies, they tax the owners of these vehicles more heavily than any other class of citizens and road users for their construction and maintenance. In other words, they take our money through state aid laws to make roads that are not suitable for automobile traffic and then tax us heavily in the form of registration and license fees for the use of these roads in order to raise a fund to repair damages they allege the cars and trucks do to them!

It is up to the motor vehicle owners, under the circumstances, to demand the building of permanent highways instead of the obsolete macadam roads. Road commissioners say to this that it is impossible to raise the necessary funds to pay for the more expensive permanent roads. The obvious answer to this assertion is that, if unavoidable, build fewer miles of new road, but let them be of some permanent kind that will suit traffic conditions—not only of today, but of the next 25 years.

However, a better way has been suggested by S. D. Waldon, formerly a member of the good roads committee of the Automobile Chamber of Commerce.

"My opinion is," he says, "that there should be only two kinds of roads built in the country: concrete and gravel. Concrete is the last word in efficient and durable surface at not too great a cost, and gravel the best farmer's road at the minimum expense. I think it is a waste of time to build roads of anything better than gravel and not as good as concrete."

Gravel roads cost only a fraction of the cost of macadam roads, and the saving that can be effected by building one mile of gravel road instead of macadam on the less travelled roads would more than pay the difference in cost of building one mile of concrete road instead of macadam.

In fact, records prove that concrete roads cost not to exceed 50 per cent. more than water-bound macadam and about the same as tar macadam. The cost of concrete in Cuyahoga county, Ohio, was \$603.34 for each foot in width one mile long, as compared with \$577.45 for water-bound macadam and \$885.30 for tar macadam. Those in Wayne county, Michigan, cost \$838.03 a foot a mile, as compared with \$862.75 for water-bound macadam in Maryland. Experimental road sections laid in Ohio by the state commission cost \$340 a foot for ordinary macadam, \$497.24 to \$651.98 for tar macadam and \$507 a foot for gravel concrete.

When properly laid, the concrete road is entirely successful, as is proved by the 65 miles that have been built in Wayne county. The cost of upkeep is almost nothing—less than \$100 last year on the whole 45 miles in Wayne county and not exceeding \$150 in 21 years on half a mile of concrete streets laid in Bellefontaine, O., in 1891-2.

No patented process or patented materials are required in making concrete roads; they are dustless and mudless, smooth, level, sanitary and self-cleaning, the rains washing the surface. The saving in maintenance alone will in a few years repay the excess of first cost over macadam. All large cities are now using concrete as a base for brick, asphalt, wood block and other street pavements.

Let the motor car interests unite in demanding permanent roads and urge that particular study be made of concrete as the most suitable material for their construction.

### SECURES HANLON PATENT.

#### Anderson Electric Car Company Purchases Entire Window Rights.

After many months of negotiating, the Anderson Electric Car Company, Detroit, maker of the Detroit electric line of cars and trucks, has purchased the entire rights in the Hanlon patent for electric car windows. This invention is held to cover the basic principles of the clear vision type of window, and the Anderson company secures control in America and abroad.

The features of the Hanlon window are held to be that of protecting the occupants of the machine from undesirable weather, and at the same time to enable the driver to see ahead clearly at all times. Adjustable from within, the operator may incline the front window to any desired angle, and in the event of rain, snow or heavy dust it may be closed from within in such manner that the storm will not beat against the front glass. When closed in very cold weather, it is maintained that it is impossible for frost to form on the glass. It is announced that this is but one of a number of new features which will be incorporated in the 1914 Detroit electric line.

### STUDYING CYCLECAR FIELD.

#### Francis R. Hoyt Has Been Engaged as Consulting Engineer by Ohio Men.

Francis R. Hoyt, Cleveland, O., a consulting engineer of wide acquaintance in the motor car industry, is engaged in an investigation of cyclecar development for a group of Ohio business men, whose identity is withheld for the present. The purpose of the inquiry is to analyze fully the mechanical features of the cyclecar and small car as they have been evolved in foreign practice, with such modifications as are necessary to meet American conditions.

It is expected that the report will show the best design to incorporate in a vehicle of the cyclecar type, which will be light in weight and simple in construction, but sturdy enough for high speed and poor roads, capable of going 45 miles on a gallon of gasoline and of making 40 to 50 miles an hour. It also is intended to design a monocar along somewhat novel lines, for light delivery service, which will be capable of carrying 400 to 500 pounds exclusive of the driver.

In this connection it is of interest to note that Mr. Hoyt is responsible for the production of a novel small car, an exact half-size model of John

Aitken's famous National racer No. 4, constructed for Master Tom Hoyt in 1910. This little machine, complete to the last detail, is driven by a small electric motor, with clutch and two brakes, and with dummy shifting lever. It is capable of making six miles an hour, and has been found to be a decidedly practical toy automobile.

### BECOMES VICE PRESIDENT.

#### Alvan Macauley Adds Duties of That Office to Those of General Manager.

Alvan Macauley, general manager of the Packard Motor Car Company, Detroit, maker of Packard pleasure cars and commercial vehicles, has been made a vice president of the concern, his title now being vice president and general manager. Mr. Macauley has been identified with three concerns, each of which occupies a commanding position in its field.

Trained in the legal profession, he developed a grasp of large business affairs as patent counsel for the National Cash Register Company, Dayton, O. In 1901 he became identified with the American

Alvan Macauley, Vice President  
Packard Motor Car Company.

Arithometer Company of St. Louis, Mo., and was instrumental in its removal to Detroit, where it became the Burroughs Adding Machine Company.

### FORMS MARTIN TRACTOR COMPANY.

#### Concern Has Exclusive Rights Except for Knox Automobile Company.

The Martin Tractor Company, Springfield, Mass., with a capital stock of \$350,000, is a new concern in the commercial vehicle field, having been formed with the following officers: President, Harry G. Fisk; vice president and general

manager, C. H. Martin; treasurer, E. O. Sutton; secretary, C. E. Beckwith.

One of the largest stockholders is S. S. Evland of Philadelphia. Aside from the Knox Automobile Company, also of Springfield, which enjoys the right to manufacture this product under the style of Knox-Martin tractor, the new company has exclusive rights under Mr. Martin's patents, with the privilege of issuing sub-licenses to other manufacturers.

### NEWSOM GOES WITH KEETON.

#### Well-Known Executive Assumes Important Duties with Detroit Concern.

H. H. Newsom, formerly manager of the McCord Manufacturing Company, and later

H. H. Newsom, Manager, Keeton Motor Company.

occupying the same position with the Hayes Manufacturing Company, has been appointed manager of the Keeton Motor Company, maker of Keeton cars. All of these companies are located in Detroit. Mr. Newsom is well and favorably known as an executive of successful industries his tenure of office with the Mc-

Cord and Hayes companies witnessing a marked growth for both concerns.

Mr. Newsom will relieve Vice President Keeton of much of the detail of the Keeton company's affairs. Mr. Keeton is also president of the Keeton Motors, Ltd., Brantford, Can., and this move will permit him to give more of his time to the affairs of the Canadian company. Preparations are being made for an immediate enlargement of the manufacturing facilities of the company, and an increase in the output for 1914 of about 3000 cars.

Mr. Newsom is a graduate of the mechanical engineering department of the Purdue University. He entered the automobile industry in its earliest stages and specialized in gas engines. He was

connected for a few years with the power department of the Chicago & Northwestern railroad. He was the first secretary of the Wolverine Automobile Club, Detroit, to which position he was twice elected.

### TO MAKE DODGE CAR.

#### Understood That Dodge Bros. Will Sever Its Connection with Ford Company.

Dodge Bros., Detroit, manufacturer of automobile engines and parts, will sever its connection with the Ford Motor Company, Detroit, on June 1, 1914, according to reports, and in the meantime the concern will begin the manufacture of automobiles of the Ford type, to be called the Dodge car. The two brothers, John and Horace E. Dodge, began with Henry Ford when the Ford plant was in its infancy, their original investment being about \$10,000.

It is said that the Dodge brothers have drawn considerable money in dividends from the Ford plant, besides making a good profit annually in their own business. Last year Dodge Bros. furnished the Ford company with engines and parts valued at \$10,000,000, according to a statement issued in Detroit.

### TAKES OVER MARATHON SALES.

#### Herff-Brook Corporation Organized in Indianapolis to Handle Entire Product.

The Herff-Brook Corporation has been incorporated under the laws of Indiana with a capital of \$100,000, to handle the output of the Marathon Motor Works, Nashville, Tenn. The offices of the new concern will be maintained at Indianapolis, Ind., and the sale of Marathon cars will be controlled throughout the United States. Branch agencies will also be established in foreign countries. According to present plans of the incorporators, eight men will be immediately placed in the field to organize agencies, and the export business will be put in competent hands.

The officers of the Herff-Brook Corporation are: President, Jacob Herff; vice president, Herbert Herff; treasurer, George Herff; secretary and sales manager, H. H. Brook. The last named has been with the Marathon company for several years as general sales manager. All are experienced automobile men. Treasurer Herff has been manager of the State Auto Company for five years, and with him has been associated his brother, Herbert Herff, in handling Marathon cars in Indianapolis.

## PURCHASES WARREN PLANT.

### Rands Manufacturing Company Will Add It to Present Holdings in Detroit.

W. C. Rands, of the Rands Manufacturing Company, Detroit, has purchased at auction the complete factory, grounds and machinery of the Warren Motor Car Company, Detroit, for \$120,000, increasing his bid of \$104,600 at a former sale, which was ordered void by the court for technical reasons. The Peter Smith Heater Company was the only opponent of Mr. Rands, but it ceased bidding after offering \$119,000. Mr. Rands made the purchase with the object of giving Detroit the leading concern in the world in the accessory manufacturing field. At present the Rands Manufacturing Company has a large plant at 69-89 East Fort street, and a second large factory directly opposite the main plant. The Warren factory will be third to be utilized.

The two factories on Fort street have 90,000 square feet, while the Warren plant possesses 73,000 square feet. As the purchase included two acres of land, on which there are no structures, Mr. Rands plans to add buildings to practically cover the entire space. This will enable the company to more than double its present business, and when it is known that during the last year the output of this concern was 150,000 windshields and 75,000 automobile tops, it will be seen that this increase means considerable.

To the line already manufactured will be added other specialties, including steering wheels, lamp brackets, top irons, tire irons and many other accessories and parts for the automobile trade. At present the company employs between 400 and 500 men, but with the addition of the new plant the force will be more than doubled.

## WILL HANDLE SALES END.

### Bump and McNab Assume Important Positions with J. I. Handley Company.

Following the formation of the J. I. Handley Company for the purpose of distributing the product of the Marion Motor Car Company, and the American Motors Company, both of Indianapolis, Ind., makers of Marion and American cars, President J. I. Handley announces that he has associated with him F. R. Bump, who becomes general sales manager. With the acquisition of Mr. Bump the new Indianapolis concern has acquired the services of one of the best-known men in the automobile industry.

Mr. Bump graduated from Cornell University in 1896 and entered the bicycle business at the completion of his course. He was identified with several of the largest concerns in the country until 1904, when he became associated with the H. H. Franklin Manufacturing Company, Syracuse, N. Y. Within one year he became general sales manager of that company and built up one of the strongest sales organizations in the country at that time. He later became assistant general manager of the R-C-H Corporation, Detroit, at the time of its organization, and has remained there until the present. He has become acquainted with distributors and dealers all over the world, and automobile authorities look for his continued success with the Indianapolis firm.

In connection with Mr. Bump's appointment comes the information that Dr. M. D. McNab will assume the position of director of sales for the Middle West, with headquarters at Chicago.

F. R. Bump, General Sales Manager, and M. D. McNab, District Sales Director, J. I. Handley Company.

Dr. McNab is vice president of the Marion Motor Car Company, and this move will in no way affect that office. He also is well known in the sales end of the industry, having been manager of the Chicago branch of the Maxwell-Briscoe Motor Company for a number of years, and later acting in the same capacity for the United States Motor Company. He is said to know 90 per cent. of the dealers in his district, which will include northern Illinois, northern Indiana, and all of Wisconsin and Iowa.

W. S. Jewell, well known to many in the automobile industry, will have charge of the metropolitan district, with headquarters in New York City, which includes parts of New York, New Jersey and Connecticut. He also has been elected vice president and general manager of the American-Marion Sales Company of New York.

## NATIONAL ANNOUNCES NEW SERIES V-3.

**A**DHERING to its policy of presenting a new series as a result of greater study, experience and manufacturing efficiency, without regard to the season or calendar date, the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, is announcing its series V-3. This comprises five models, including five and seven-passenger touring, four-passenger toy tonneau, two-passenger speedway roadster and two-passenger semi-racing roadster. All are fitted with the Gray & Davis electric motor starter and lighting system, and the balance of the equipment is very complete, every convenience being provided.

The new series is a continuation in general of

cated on opposite sides and are actuated by camshafts driven by spiral cut timing gears. The valve stems and springs are completely enclosed, eliminating noise and protecting the mechanism from the abrasive effect of road dust. The crankshaft is ample in size, of vanadium steel ground to one-thousandth part of an inch, and provided with extra long bearings. The aluminum crankcase is horizontally divided, and all interior components of the power plant are very accessible.

Carburetion is by an 1.75-inch Rayfield hot water jacketed carburetor on all models, with the exception of the roadster, which is fitted with a two-inch, although option of a Schebler is given. Dash control is standard. Pressure feed of fuel

**National Series V-3 Five-Passenger Touring Car, Having Four-Cylinder Motor, Extra Roomy Body, Luxurious Upholstery and a Complete Equipment.**

the former series and the same high grade material and workmanship for which the product of the company is noted, makes for a quality car, one having ample power and speed as well as durability, reliability and efficiency under all conditions of service. The reliability of the National product has been amply demonstrated in track and road contests and the company points with pride to its world's stock car championship and the record made in the 500-mile Indianapolis race, which mark still stands.

The series V-3 chassis has a four-cylinder motor with a bore of 4.875 inches and stroke of six, with the cylinders cast in pairs and thoroughly annealed. The valves are mechanically operated, interchangeable, and have large nickel steel heads. The intake and exhaust members are lo-

is employed, the proper pressure being maintained by a small pump in the crankcase. The two sets of spark plugs are located in the valve caps in the cylinder heads and current is supplied by a gear driven high-tension dual double Bosch magneto with a storage battery in reserve. As in the past, the use of packing is eliminated, tapered nipples being utilized on the intake, exhaust and water pipes, a construction preventing opportunity for leakage. Integral with the motor is a tire pump.

The lubrication system is of the constant level, force feed type, a gear driven pump feeding oil to the bearings and cylinders. The capacity of the crankcase is four gallons. A pressure feed is utilized on the roadster, a 10-gallon container being mounted on the rear deck.

Cooling is by a centrifugal pump and the system has a capacity of six gallons. The radiator is a special straight line type, mounted on trunnions to prevent damage through vibration. Cooling is assisted by an adjustable, belt driven, ball bearing fan attached to the motor base. Brass outlet tubes are employed and the radiator cap is of notched hard rubber. The filler is of ample length. The efficiency of the cooling and lubrication systems of the National has been amply demonstrated in speed contests.

The clutch is a self-contained, leather faced aluminum cone, spring cushioned to give gradual but positive engagement, and is removable without disturbing the transmission. The clutch operates smoothly, and an efficient clutch brake makes changing of gears an easy matter.

The transmission is of the selective type, af-

umn is set at a comfortable angle and is surmounted by an 18-inch wheel. The steering gear is of the worm and gear type and ball connections are employed to the steering knuckle.

The springs are semi-elliptic front and three-quarter scroll elliptic rear. The frame is of pressed steel, wide flanged, five-inch channel section on all models except the roadster, which is 4.5, firmly riveted and braced, and having a kick-up at the rear. No sub-frame is utilized. The wheelbase of the touring models is 128 inches, that of the speedway roadster, 120. Both the front and rear mudguards are of the wide and continuous type. Metal dust shields between the frame and running boards further protect the passengers and also serve to conceal the tool box. Shields are fitted over the rear spring shackles.

The bodies of the new series are of sheet

**National Four-Passenger Toy Tonneau, Having Attractive Lines, Left Hand Drive and Centre Control.**

fording three speeds forward and reverse. The gears are of chrome nickel steel, oil tempered, and annular ball bearings are utilized, these running in oil. Drive is by bevel gear through straight line shaft with double universal joints and torsion member. The front axle is of the I beam section type, a one-piece steel forging. Large adjustable roller bearings are utilized in the wheel hubs also at the top of the yokes. The rear axle is of the full floating type.

Two sets of brakes are provided, the service members being of the internal expanding type operated by pedal, while the emergency members are external contracting. Both are located on the rear wheels, the drums of which are 16 inches in diameter, of a one-piece pressed steel secured by 12 bolts. The driver is located at the left with right, centre control. The steering col-

metal, low and extra roomy, having wide doors and entrance at either side. They are noticeable for their straight and attractive lines, and the upholstery is unusually deep and comfortable, with special deep Turkish cushions. A concealed, but readily accessible baggage carrying compartment is provided under the front seats of the touring models.

Firestone demountable rims with one extra member are standard equipment, which also includes in addition to the electric motor starter and lighting system, top, cover and curtains, ventilating, rain vision windshield, Truffault-Hartford shock absorbers in the rear, electric horn under hood, Gray & Davis 12-inch black and nickel bullet headlights, insert dash lights. Gray & Davis six-inch black and nickel side lights are fitted to the toy tonneau and speedway roadster.

## NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

**Cello Dashlight.**

The law regarding the speed of a motor car is enforced at night as well as in the daytime, and unless the car is equipped with an electric lighting system, including a speedometer light, it is difficult to utilize the speed indicator to advantage. The A. S. Campbell Company, Atlantic avenue, Boston, is marketing an inexpensive dashlight for speedometers, and a feature of the device is that it is operated on one standard dry cell. It comprises a standard or bracket for mounting on the dash over the speedometer dial or other indicating device, also a hooded reflector. The lamp is a powerful tungsten bulb, requiring but a small amount of current to operate, and incorporated in the dashlight proper is an ingenious switch. The Cello is well and sturdily constructed, heavily nickel plated, and a sufficient length of high-grade cord is included in the equipment. The Cello is guaranteed as represented.

**Apco Ford Oil Filler.**

The Auto Parts Company, Providence, R. I., maker of Ford specialties, is marketing the Apco combination breather pipe and oil filler for model T Ford automobiles. It is constructed to replace the usual filler cap and has the advantage of possessing a large top, making the replenishment of the supply of oil an easy task, even in the dark. The design of the filler is such that any mist from the crankcase is prevented from soiling the exterior of the engine. A strainer is incorporated in the filler, preventing the entrance of any foreign elements that may exist in the lubricant. The device is made of cast aluminum, with polished hinged cap, and is moderately priced.

**Basline Autowline.**

The Edwards Manufacturing Company, Cincinnati, O., is marketing the Basline Autowline, which differs from the conventional devices of this nature in that instead of a rope a yellow strand wire member is utilized. This steel wire is but .25 inch in diameter, and it is stated that it can pull a 4000-pound car up a 20 per cent. grade. The complete equipment weighs but five pounds and it may be coiled up compactly and placed under a seat. The Autowline may also be employed to extricate a car from deep mud or a rut by attaching it to the wheel and hub, using the latter as a capstan, the other end being secured to any stationary object at the roadside.

**Boston Combination Grease Gun.**

One of the advantages of the Boston combination grease gun made by the Randall-Faichney Company, Boston, is that it is adaptable for handling gasoline as well as light or heavy oils and greases. When oils and

light greases are being employed, the Boston is used as an ordinary grease gun. For heavy greases, a lock nut is screwed down firmly and the T handle rotated, which movement forces the piston forward on a heavy square screw thread. The grease is forced out in ribbon form, which, it is stated, packs the gearcase, transmission, differential, etc., much better and more quickly than with ordinary guns. The Boston comes in various sizes ranging from three to 18 ounces capacities, and the equipment includes oil and grease tip and plug for closing. The finish is brass, lacquered.

**B. R. Shock Absorber.**

The B. R. shock absorber is marketed by the Lattig & Townsend Sales Company, 1431 Spring Garden street, Philadelphia, and it is claimed that both the compression and recoil of the car spring is compensated for. It is also stated that the absorbers require no attention or adjustment after installation. The B. R. device is of the clock spring type, the same width as the car spring, has six turns spaced .25-inch apart between convolutions, and is six inches in diameter. The absorber is placed under the top mainspring, and the top and bottom bolts are inserted through the shackle. A centre bolt is then placed between the slotted portion of the shackle and suitable clamps secured, as outlined in the illustration, to prevent shifting of the spring and to care for the rebound.

**Kemco Fan Type Dynamo.**

A novel installation of a lighting dynamo is noted in the Kemco, produced by the Kouyoumjian Electric & Manufacturing Company, Cleveland, O. It is a combination dynamo and fan, and replaces the ordinary fan. It is driven by a belt in the conventional manner, comes ready for attachment and is installed by removing the fan. It is stated that the size is such that it may conveniently be placed between the radiator and cylinders. With the motor operating the dynamo generates current for charging the storage battery, which may be employed for lighting and starting purposes.

**Endura Sheet Packing.**

The Endura Manufacturing Company, Philadelphia, has brought out a new form of sheet packing which is made especially for service with hot or cold water connections, oil, gasoline, coal tar, etc. Endura packing is a vegetable fibre chemically treated, and having exceptional tensile strength will withstand a very heavy pressure without giving. It cuts very easily, is light in weight and is held to be as tough as rawhide. It is further claimed by the maker that the wetter it is the tougher it gets. One of the features of Endura is its light weight, making for economy, as it is sold by weight.

Cello Dashlight

Apco Oil Filler

Basline Autowline

B. R. Shock Absorber

Kemco Fan Dynamo

Boston Combination Grease Gun

R. C. W. Master Vibrator

It comes in sheets 41 inches square and .0625 and .125-inch thick; also in rolls 41 inches wide, in thicknesses of .015625 and .03125-inch.

#### R. C. W. Master Vibrator.

The R. C. Wells Manufacturing Company, Fond-du-Lac, Wis., is marketing a master vibrator termed the R. C. W. It is designed for synchronizing the spark of multi-cylinder motors, and may be employed with batteries and a low-tension magneto, or both. By its use separate vibrator adjustments are eliminated and the operation of the engine is improved considerably through accurate timing of the spark. The vibrator comes in a neat mahogany case with a neat, substantial kick switch and a removable plug for locking the ignition.

#### Col-Mac Light Clamp.

The Breeze Carburetor Company, Newark, N. J., has brought out a new device termed the Col-Mac flexible electric arm clamp, which presents practical features in that the light may be positioned as desired. It comprises an arm which carries at one end the shaded electric bulb, and at the other a detachable, adjustable clamp device. The clamp, which is of manganese bronze, has a three-inch clearance, and is equipped with a washer and screw stem, enabling it to be held securely on the work bench, lathe, running board of the car, etc. It is stated by the company that the arm may be bent to any desired position; that it will remain as placed until altered, and that it is not affected by constant use. The arm is firmly connected to the clamp by screwing into a boss on the side, through which, and the arm, the electric cord is drawn up to the lamp socket. The flexible electric arm and clamp comes in several styles, including a polished brass finish with 12-inch arm, 15 feet of cord and an oval shade, also a seven-inch parabola shade, and polished nickel, oxidized copper or bronze black finish. The arm referred to above is made in various lengths to meet individual requirements and installations.

#### Essex Spring Bumpers.

The Essex Rubber Company, Inc., Trenton, N. J., is manufacturing the Essex rubber spring bumpers, which are made in two forms, round and oblong. They are designed to be attached to the top leaf of the lower half of the car spring, and to prevent undue compression of the spring when the wheels encounter obstacles. The bumpers are secured by special straps, and it is held that they are very durable, being made of a high-grade rubber. They are made in three sizes, small, medium and large, the width being 1.5, 1.75 and two inches, respectively. They are moderately priced.

#### Noark Enclosed Fuse.

The H. W. Johns-Manville Company, Madison avenue and 41st street, New York City, is marketing a special fuse for service with electric lighting outfits. It is termed the Noark, because there is no arc or flash in the event

the fuse blows out, as the fuses are designed to do when a predetermined voltage is exceeded. This protects the lamps, etc. The Noark fuse is of the enclosed type, and in the event of its blowing, danger of fire igniting gasoline vapor is eliminated. The fuses are very compact and all working parts are gauged to a 10,000th of an inch to insure reliability of operation. They are constructed in various forms.

#### Maco Carburetor.

Maximum efficiency with a minimum consumption of fuel and simplicity of design are features emphasized with the Maco carburetor, manufactured by the Gleason-Peters Air Pump Company, 225 Classon avenue, Brooklyn, N. Y. There are but two adjustments, the fuel for low speed and the auxiliary air for high speed. The float chamber of the Maco is radial, enabling its being placed in any convenient position for attaching the fuel line, and the spraying nozzle is directly in the centre, insuring a constant fuel level at all times. The venturi tube in the constant air supply is so placed as to create a strong suction just above the point of the spraying nozzle, insuring the breaking up of all particles of fuel. The needle valve adjustment is on the top of the carburetor, a convenient location, and it is stated that being inserted in the top of the spraying nozzle, it spreads the fuel, greatly assisting in its vaporization. Leaks are also avoided by the arrangement. It is claimed that a perfect mixture is obtained automatically at any degree of speed. It is adapted for two as well as four-cycle engines. The Maco is constructed in several styles to meet the requirements of the motor, and in standard sizes.

#### Desmond Back Pressure Tire Gauge.

The Chicago-Racine Aluminum, Brass & Iron Works, 230 West Huron street, Chicago, is manufacturing the Desmond back pressure tire gauge, which is adapted for service with power and hand tire pumps. It is incorporated in the hose line between the source of supply and the tire, and the pressure in the tube may be taken instantly by pressing a small button. This indicates the amount of air by a hand on a calibrated dial. It also prevents further entrance of the atmosphere until desired by the operator. The gauge is very compact, well constructed and inexpensive.

#### Jericho Motorcycle Horn.

The Randall-Falchney Company, Boston, is marketing the Jericho motorcycle horn, which embodies the same quality of workmanship, material and efficiency as the Jubilee and Jericho horns made by this concern for automobile use. It is attached to the exhaust pipe between the motor and the muffler, the operation involving but little labor. Suitable fittings are supplied with each horn, which is operated by a metal cable. It is stated that the Jericho motorcycle horn has a penetrating, far-reaching, mellow tone, is positive in its action, and requires no attention after installation.

#### Standard Battery Connector.

In wiring dry cells, either in series or multiple series, it is important that the connections be tight if maximum efficiency is to be secured from the batteries. The Fitzgerald Manufacturing Company, Torrington, Conn., is producing a new design termed the Standard battery connector, which is constructed to grip the locking nut or terminal of the cell, and it is stated that the nuts will not jar or work loose. The company also manufactures another design with which locking nuts are not necessary. It is attached by simply springing apart the terminal loops, which when released grip the post.

#### Red Seal Dry Battery.

In these days of magneto ignition the motorist is prone to neglect the dry cells utilized for starting or as an auxiliary. As these members are only occasionally employed it imperative that they be of serviceable quality and not subject to deterioration. The Manhattan Electrical Supply Company, 17 Park Place, New York City, is the maker of the well-known Red Seal dry cells, which are especially designed for ignition systems in motor car, motor boat, etc. The maker states that the Red Seal cell will show a greater amperage after service than any other form and that it does not deteriorate by standing idle. It is made both in round and square cartons and each of these is produced in three sizes to meet the requirements of service. The square type is placed in a box of non-conductive material to prevent the pos-

removing any deposits when the valve handle is turned. The handle of the valve is provided with fibre which does not get hot or require a long stem for cooling, as does an iron handle.

#### Boston Auto Clocks.

The Boston Clock Company, 16 State street, Boston, is marketing a line of high-grade automobile clocks, one of which, the model C, is shown in an accompanying illustration. One of the features of the timepiece is that it is adjustable to various angles by a ratchet and nut arrangement located at the back. The design of the clock approaches makes of speedometers, being very neat in appearance. It is an eight-day timepiece, having seven jewelled escapements, Breguet hairsprings, cut steel pinions, compensation balances, dust and water proof cases, etc. It is made in three sizes, having three, 3.5 and four-inch dials. An outside patented stem-winding and stem-setting device is listed as slightly extra.

#### Kantalever Emergency Spring Repairer.

It is decidedly inconvenient to be caught on the road some distance from home with a broken spring. While temporary repairs may be effected with blocks, etc., considerable care must be exercised in the operation of the car. The Motor Car Equipment Company, 55 Warren street, New York City, is marketing a practical device called the Kantalever emergency spring repairer, which, when applied properly, is stated to be able to sustain a

sibility of short circuits where the cell is subject to considerable vibration.

#### Auto Traffic Signal.

The Fawkes Auto Company, Minneapolis, Minn., is manufacturing the Auto Traffic signal, which is designed for attachment to the front or rear of the car, or both. It comprises a form of rotating arrow, the head of which is electrically illuminated. It is operated by a small lever on the steering column connected up with a steel rod which passes under the hood and which is furnished with drop-forged universal joint connections. By it the operator of the machine is enabled to signal an approaching vehicle, also to warn those in the rear of the direction to be taken by the car upon which it is fitted. The signals are furnished in black and nickel and are supplied for any make of car.

#### Universal Blow Torch.

The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Penn., is marketing a new gasoline blow torch, presenting a number of interesting features which, it is claimed, adapts it to all conditions of service. The burner is constructed particularly heavy so that it will retain its heat and keep the torch burning in cold or windy weather. The drip cup is made especially deep, making it possible to start the torch easily. Another feature is the provision made for automatic cleaning, the needle at the end of the valve stem

broken spring for an indefinite period. The Kantalever may be utilized for any type of break, including that of the main leaf near the spring horn, as the device is provided with an opening through which a bolt may be inserted, practically providing a new horn. The repairer can be applied to any broken section as suitable clamping bolts, etc., accompany the device. The Kantalever is made of 50 point carbon steel and is guaranteed not to break under the strain of any car load. It comes packed in a water proof black bag having two snap clasps and occupies but little room in the car as it can be placed in the tool box.

#### Ridlon Adjustable Wheel Puller.

J. R. Ridlon, 550 Surf street, Chicago, is manufacturing the Ridlon adjustable gear and wheel puller. It comprises a 12-inch screw with a .75-inch standard thread upon which travels a 1.5-inch conical block. On each of the opposite sides of this block are a pair of pulling arms, retained in position by a shoulder screw. Each arm member has nine openings, through which the shoulder screw may be placed, providing nine different adjustments. The pulling arms have a hook end placed at an angle of 135 degrees to the long section of the arms, so that when the long part is at 45 degrees to the screw, the hook end will be parallel with it. This position allows the hook to bear against the gear with its entire face, insuring a firm grip.

## AN INTERESTING EXPLORATION TOUR.

**Itinerary Visits Sections of New England Well Off the Beaten Track, Affording Abundant Opportunity to Search Out the Quaint and Picturesque.**

**F**OR those who delight in exploring the highways and byways off the beaten track, no section of the country offers better inducements than New England. Quite as often it is possible to find as good roads connecting the smaller and lesser known towns as on the main trunk lines. Each locality seems to possess its own peculiar charm, and there is so much that is quaint and picturesque that the motorist never tires of seeking new experiences. The itinerary outlined herein as No. 15 combines state highways and backwoods roads in what is regarded as the proper proportions.

given to it in any other manner.

Springfield is too well known to permit of extended comment when considering a tour of exploration. Ludlow is a delightful little place near the falls on the Chicopee river, where the Indians are said to have camped after the destruction of Springfield in 1675. A little further along the route passes the auxiliary reservoir of the Springfield water department and then turns toward Belcher-town, favorably known as a quiet summer place. The town is located on top of a hill, and several bold prominences and handsome ponds are in the vicinity. It was

trunk line, east and west across Massachusetts, splendid roads are the rule.

At Gardner, the way turns northward to Winchendon, past Crystal lake, and with splendid views of Mt. Watatic on the right. Soon after leaving Winchendon it crosses the New Hampshire line, almost under the shadow of Monadnock mountain, glimpses of which have been coming into view ever since leaving Athol. Its rugged top rises 3186 feet above the sea, and from its summit splendid views of the Presidential range in the White mountains far

**At Left, One of the Many Shady Drives in the Vicinity of Mt. Monadnock; at Right, Sunshine and Shadow on the River Near Hartford, Conn.**

Leaving Hartford, Conn., the morning of the first day, the initial portion of the trip is over excellent macadam into Springfield, over the so-called east side route, through East Hartford, Warehouse Point, Thompsonville and Longmeadow. This is the far-famed Connecticut tobacco country, and on either side of the road the fields present almost endless rows of plants, sometimes growing in the open and at other times protected from the damaging hail and wind by stout canvas. This canvas also is used to give the tobacco a certain color and flavor, which, it is said, cannot be

settled in 1731, and was named Cold Spring, because of a large fountain within its border.

Enfield, Mass., also is well known as a quiet summer place, it being a rural hamlet in a farming and dairy district, among high and wooded ridges. Then comes Greenwich, on the old Indian domain of Quabin, and in the shadow of Mt. Lizzie. North Dana, on the shores of Neeseponsett, and New Salem, a highland village near Packard's mountain, are passed on the way to Athol. In Athol much state highway construction is under way, and as this portion of the route to Gardner is over the

to the north may be obtained. The night stop is at Keene.

Dublin, reached early on the second day, is 1500 feet above the sea, near the lovely Monadnock lake and mountain, and in the midst of scenery that has been compared to the richest to be found in Scotland. Hillsboro is the birthplace of President Franklin Pierce. Henniker is a neat and pleasant village with shady streets, which has endeared itself to those who are seeking a restful summer resort amid fair, rural scenery. Many profitable farms are to be found in this vicinity. Hopkinton also is noted for its rich farming

Three Charming Views Which Indicate Road Conditions to Be Encountered Off the Beaten Path in New England.

country, particularly prolific in corn, oats, potatoes and dairy products. It is stated that it came near being the capital of the state, and that is no mere play on words, despite the fact that it is within 8.1 miles of Concord. The tourist will enjoy a visit to Putney Hill, one mile west of the village, with its ancient cemetery and the ruins of Putney fort. It is 500 feet above the town and gives an excellent view of the Contocook and Merrimac valleys and the White mountains.

After reaching Concord, the tour turns down the Merrimac valley, over better-known ways to Nashua for the night stop. The third day takes the tourist the remainder of the way down the valley to Boston, then along the South Shore to Plymouth. The first portion of this day's run is almost too well known for extended description. The latter portion is over the so-called short line to Plymouth, through Quincy and Weymouth.

Quincy is a large and picturesque agricultural town, much of the land having been the estates of Presidents John Adams and John Quincy Adams. Opposite the granite town hall is the Adams Temple, an antique church near which the two Presidents are buried. The district was first settled by Weston's company in 1622, and was first known as Mount Merry. At one time Miles Standish marched against the jovial Episcopalians of the settlement from Plymouth and sent several of the band captive to England.

In 1623, Standish made the attack upon the assembled Indian chiefs described in the seventh part of "The Courtship of Miles Standish," written by Longfellow. After this affair, the Episcopalian colonists left, and in 1624 a company moved in from Weymouth, England, who gave its name to this town.

After spending the night, and as much longer as the tourist de-

sires, in historic Plymouth, the way leads through the ancient wilderness of Plymouth to Middleboro, near which to the south are the great Lakeville ponds.

Taunton was founded by Miss Elizabeth Pool, a pious Puritan of Taunton, England. The settlement was on the territory of Cohannet, and King Philip was particularly friendly to the settlers, until the midsummer of 1676, when he attacked the place, but was driven off and followed sharply until he was killed. In 1810 there were but 50 houses left, but the splendid water power soon induced the location of factories and its growth was decidedly rapid.

A splendid state road leads from Taunton to Providence, through Rehoboth, which town once came within one vote of being selected as the capital of Massachusetts. The Rhode Island line is crossed shortly before reaching East Providence. The route across the state is through some of the older

River Scenes in the Valley of the Nashua River and the Southern Portion of New Hampshire.

towns, in many of which the abandoned factories and farms tell their mute story of the past. The last portion of the way, before entering Connecticut, is through the Indian districts of Attawangan and Minnetixit.

Near Danielson is Mashapaug lake, concerning which it is stated that far back in the ante-colonial days the Indians were accustomed to hold revels on a hill on the site of this lake. During a prolonged merrymaking of four days' length, the Great Spirit became offended and struck out the foundations of the hill, with the result that the lake came into being. Of all the tribe, one woman alone was saved on a small island now standing in the centre of the sheet of water. On still, clear days, it is claimed that the submerged forest may be seen under the deepest waters.

Willimantic is a well-known thread centre, in the town of Windham. The famous battle of the frogs was fought near this city. Bolton Notch is a romantic pass into the valley of the Connecticut river, and the remainder of the distance into Hartford is over well-known ways.

## MECHANICAL NOTES FOR OWNERS.

### Dash Side Lights Constructed from Pocket Type of Electric Lamps--Stuffing Box for Leaky Tappets--Equalizer for Separate Rod Brakes.

THE convenience of electric lighting appeals to the motorist, and many owners whose cars are not equipped with dynamos have installed the straight storage battery system. While with this system the battery must be recharged when it becomes exhausted, if employed solely for supplying current to the side lights and tail lamp, it provides satisfactory service. Of course, the number of hours the lamps will burn depends upon the size of the bulbs and the capacity of the battery.

Although lamps may be purchased at a moderate price and there are several devices for converting oil into electrical units, they may be constructed by the owner. The following contribution from a reader is of interest in that he con-

required for a connection between it and the end of the bulb. Securing some round fibre about .125 inch larger in diameter than the opening in the plate, I took it to a machine shop and had it turned up to the shape shown at C. A hole to take a dry cell battery terminal was drilled through the centre of the fibre piece as shown. Before inserting the screw member one end was peined over.

The assembly is shown at A. It will be seen that when the fibre is inserted in the opening of the plate and the latter screwed up snugly, the peined head of the terminal part comes in contact with the centre pole of the electric bulb. A terminal soldered to the lower section of the plate provides the second pole, and by using dry cell terminals the leads from the battery are secured. The lamps were placed in the dash by cutting a circular hole and secured by four small wood screws. They are neat in appearance, and by using lamp cord the wires do not detract unduly from the appearance of the dash. At present I am using the bulbs which came with the lamps and dry cells, but plan to change the lights for tungsten members and employ a storage battery. The tail light is also an electrical unit.

#### RENOVATING FELT WASHERS.

Felt washers that have become hardened or caked with old lubricant may be made serviceable by soaking them in gasoline or kerosene and flexing the material.

#### EFFICIENCY OF DRY CELLS.

The efficiency of dry cells wired in series or multiple series is impaired if one or more in the set is decidedly below the average of the others. Test each cell with an ammeter and throw out any that falls considerably below that of the others.

#### SLOTING BOLT HEADS.

When round-headed bolts are fitted to the chassis and used to hold some part in place by means of a lock nut, these members are difficult to remove after becoming rusted. If the bolt has a square section near the head, it will turn when fitted in wood. Often it is impossible to get a grip with a Stillson wrench on the head of the bolt, and using a wrench on the nut simply rotates the bolt as a whole. If a hacksaw can be applied to the head of the bolt, cut a small slot and deep enough to take the tip of a screw driver blade. Then apply kerosene to the thread and nut and by holding the head with a screw driver, the refractory bolt may be removed.

Dash Side Electric Lights Made from Pocket Type of Lamp: A, Showing Construction; B, Plate for Securing Lamp to Dash; C, Fibre Block Carrying Terminal and Used to Connect One Lead of Battery to Bulb.

verted a pair of old pocket type electric lamps into dash members and at a very slight expense.

The suggestion of one of your readers for making an emergency tail light, which was printed in the last issue of your book, gave me an idea for making side lights. I am enclosing a rough sketch showing how the work was done, and I did all of it except turning down the fibre pieces.

I had a pair of electric flash lights of the round type and having a bull's-eye end. The section carrying the bulb and reflector is screwed on a circular shell, the last named serving as one side of the circuit. The other connection is made by the little dry cell which slips into the shell, the battery having a small, round brass terminal in the centre which comes in contact with the centre part of the stem of the bulb, completing the circuit.

I cut the shell just back of the threaded section, as shown at A in the accompanying illustration. To this I soldered a circular piece of heavy brass plate about .5 inch larger in diameter than that of the shell. This plate is shown at B, and it will be seen that a hole is drilled in its centre, also four other openings to take screws when the plate is secured to the dash.

By screwing on the plate I ascertained the distance

## FITTING EQUALIZER TO BRAKES.

Equalizers are utilized with braking systems to insure an even or balanced pull on the brakes proper, which is difficult to secure if each brake rod must be adjusted separately, as was the case with some older forms of braking systems. When the separate rod system is employed, it is customary to jack up both wheels, lengthen or shorten each rod and try the resistance of the wheel by hand with the brakes partially and wholly set. While it would appear that this method would give satisfactory results, a variation in the adjustment of the wheel bearings, etc., is apt to make considerable difference when the wheels are supporting the weight of the car and passengers. The following method of fitting an equalizer to an old car is suggested by a reader, who states in his communication that the ex-

keep the brakes normally in a released position.

I utilized the old brake bar to obtain the desired leverage. It formerly rotated as shown at C, but as it was necessary to line up the equalizer with the old bar and to have a straight, even pull, I changed the direction of rotation by reversing the position of the lever as shown at D.

By displacing the old bar, removing the bell cranks from each end and fitting these to the underside of the bar, I was able to obtain a straight pull and in the desired forward direction. The ends of a wire cable were attached to these levers, and as the cable operated on the roller pulley, the pull was equalized. I might add that I faced the bracket attachment and the underside of the frame with sheet fibre to prevent the equalizer rattling. The entire work, with the exception of the bracket and pulley support, was performed by myself. The cost of the metal work was slight, and I am now able to obtain good service from the brakes.

## TAPPET GUIDE STUFFING BOX.

It is not uncommon on lifting the hood of an old motor to note that it is covered with dirty lubricant. This is generally due to worn tappet

Contribution from a Reader, Illustrating Method of Fitting Equalizer to Braking System on an Old Car: A, Bracket Bolted to Frame and Carrying Equalizing Bar; B, Pulley and Bracket; C, Original Direction of Rotation of Old Brake Bar; D, How It Was Changed to Obtain a Forward Pull to Cable.

pense was slight and that the greater part of the work was of the home-made order:

I am enclosing a sketch of how I fitted an equalizer to the brakes on my car, which is an old one, having but one set, these acting on the interior of the drums of the rear wheels. The brake pedal, when pushed forward slightly, rotated a round bar extending across the frame of the chassis, and to this bar was fitted a bell crank at either end. To the lever on each side was attached the brake rod.

I experienced considerable trouble in adjusting the brakes so that each would hold alike, although I was very careful in the work. The bell crank levers also worked loose, creating considerable lost motion in the pedal mechanism, so I decided to fit an equalizer. I found it would not be advisable to cut a slot in the frame to carry the sliding equalizing bar, as the frame was too light, and in addition it would be a troublesome job.

I solved the problem by making a clamp as shown at A, and by drilling holes in it and the frame and using bolts I was able to fasten it in a rugged manner. The equalizing bar was made of iron, and before inserting it I drilled a hole at either end to take the brackets of the brake rods. I also drilled the holes to retain the pulley member shown at B. The latter was made to slip over the bar after it was located, and secured by bolts and lock nuts. The bar was also drilled to take the ends of two springs which were fastened to the frame as shown at E in the sketch. These spring members served to

guides, although sometimes the fluid will work out around the end bearings of the crankshaft. The best method of repair is to fit new guides and tappets, although the former may be turned to fit the pushrods.

In an accompanying illustration is shown a stuffing box which the writer noted fitted to an old motor. The guides were of bronze, a drive fit in the upper crankcase and projecting above the top of the case about .625 inch. In overhauling the motor it was noted that the pushrods were worn badly and that new members, as well as guides, would be required. This would involve an expenditure of \$10.80 for new members, so the stuffing boxes illustrated in the drawing were made.

The valves and pushrods were displaced and a thread cut on the outside of the guides as shown at B. The interior of the guide was countersunk as indicated by the dotted lines. The stuffing box

Stuffing Box for Leaky Tappet Guides.

was constructed of a piece of heavy brass tubing, drilled to form a lip at the top to hold the packing and threaded inside. By using one strand graphited candle wicking, soaking it with oil in the stuffing box, and screwing it down properly, the loss of lubricant from the crankcase was prevented. The device could be improved further by utilizing a lock nut below the stuffing box, this depending, of course, upon the space between it and the crankcase. The same method could be applied to some types of worn valve stem guides where considerable auxiliary air is noted.

### TIMING THE PRIMARY CIRCUIT.

Although the magneto has supplanted the timer, coil and battery system of ignition, the commutator is fitted for starting purposes and as an auxiliary on some cars, and as standard equipment on others, particularly old types. Timers will wear, and if they are not given proper attention, such as cleaning and oiling, troubles will develop in time, requiring a new member or repairing of the roller, contact blocks and bushings.

Many owners not familiar with the principles of the timer system of ignition hesitate to displace the commutator for repairs, and often in so doing are obliged to call in the expert to retim the ignition. The fitting of a new timer will require a knowledge of timing, but the replacing of a commutator after repairs may be accomplished easily and correctly by taking a few simple precautions.

In an accompanying illustration is shown a conventional type of four-cylinder timer, and it is assumed that the drawing represents it in its normal position; that is, with the spark lever fully retarded. It should be borne in mind that the timer proper does not rotate except for a very short distance and only when moved by the rods connecting it with the spark lever. The roller rotates with the timer shaft, or camshaft, and in the illustration the shaft runs anti-clockwise, or to the left.

As the roller comes in contact with the blocks, to which are secured the primary wires through terminals, the primary circuit is closed and the

current built up into a high-tension and led to the plugs by cables from the coil. In the drawing the timer is wired for a four-cylinder motor firing 1, 3, 4, 2. It will be noted that the fibre ring in which the contact blocks are imbedded is marked I, II, III and IIII. It also will be seen that the roller in rotating to the left makes contact in the following order: I, III, IIII, II. By marking these numbers on the fibre it is a simple matter to replace the wires in their proper order. It should be remembered that the rod member should be connected to the timer before the wires are replaced.

Some types of timers are secured to the shaft by set screws, while others are held by a locking nut screwed onto the top of the shaft and over the lever member. If the top of the shaft and the lever mechanism are marked as shown in the drawing before displacing the timer, it will be a simple matter to replace it without going to the trouble of retiming it by the location of the piston or crankshaft.

In explanation, it may be stated that with four-cylinder motors the crankshaft makes two complete revolutions to one of the timer shaft, and that a cylinder explodes every quarter-turn, or 90 degrees, as represented by the travel of the roller. Ordinarily the roller would be approximately between two blocks, the I and II, as indicated in the drawing, for example. If the timer is replaced on the shaft so that the two lines coincide, the original timing will be observed. In replacing the timer care should be exercised to see that the spark lever is fully retarded.

Showing How a Timer May Be Marked to Insure Correct Replacement of Wires, also Correct Timing.

**CLOGGED GAS BURNERS.**

Motorists whose machines are equipped with acetylene for lighting have experienced the annoyance of having one of the burners of the headlights become partially clogged, causing the flame to shoot backward or forward. Sometimes this will result in a cracked mirror. The best method of cleaning a burner is to utilize the needle device manufactured for this purpose, but it may happen that one will be caught without the tool and some distance from the nearest garage. The usual procedure is to employ the tire pump, which often removes the deposit. This will not, however, always prove satisfactory. The following hint is contributed by an owner who states that it has been employed with success:

Remove the burner from the lamp and cover the air passages and one gas outlet by the finger tips, then blow through the burner. By noting the resistance, then trying the other outlet, it may be determined easily which one is at fault. If the passage cannot be cleared by the usual methods, reverse the burner and blow through the gas tip end. Unless badly clogged the gas passage will usually yield to this treatment.

Another suggestion is to tap the metal base of the burner with a pair of pliers. The application of the tire pump to the tubing is not recommended as the pressure is likely to burst the rubber walls.

**DIRECT FACTORY BRANCH.****British Manufacturer of Commer Trucks to Take Over Business in America.**

Commercial Cars, Ltd., Luton, England, maker of the well-known Commer truck, is to establish a direct branch of the company at New York City, with A. C. Platt, formerly connected with the Wyckoff, Church & Partridge firm, as manager. It is stated that arrangements for the manufacture of the truck in this country may be made later.

Mr. Platt explains that he has 18 or 20 trucks now on hand, and he is now seeking a suitable location. When the Commer Truck Company of America was incorporated in March with a capital of \$3,000,000, it was presumed that it was for the purpose of taking over the Commer business in this country, which was interrupted by the failure of Wyckoff, Church & Partridge. The English company decided, however, on the expiration of the contract, that a direct branch here would serve its interests better.

**BORLAND'S RECORD MILEAGE.****Richard Mansell Drives Electric Roadster 97.2 Miles on Single Charge.**

One of the features of the recent picnic of the Electric Vehicle Association and the Electric Garage Men's Association of Chicago at Cedar Lake, Ind., was the remarkable run made by a Borland electric roadster, the product of the Borland-Grannis Company of that city. The distance over the road, according to a Warner speedometer attached to the machine, was 97.2 miles, and this was covered on a single charge of the battery. Several difficult grades and hills were encountered, and the average speed on the level was 15 miles an hour.

A special train carried a large delegation of electric vehicle men to the picnic grounds, while

**Richard Mansell of Chicago on 97-Mile Cross-Country Trip in Borland Electric Roadster.**

several others went in gasoline cars. The festivities were at their height when Richard Mansell, Chicago retail branch manager for the Borland-Grannis Company, drew up in front of the tables in his roadster. Immediately, the entertainment programme was suspended to hear the report of the trip.

The car used was a regular stock model, equipped with a 42-cell, 11-plate Hycap-Exide battery, made by the Electric Storage Battery Company, Philadelphia. The run created a decided sensation all along the route, and when the electric car men in Crown Point heard of it, they assembled their machines to escort Mansell through the town on his return trip.

Supply men state that figures are being asked for by manufacturers of cyclecars, who will turn out in the neighborhood of 30,000 machines in the first lots of four Detroit factories.

gress of March 3rd, 1879.

## FEDERAL ROAD FUNDS.

The widespread interest which has been created in the subject of good roads is the result of the agitation systematically carried on by motorists. Within the past year there has been a growing disposition to inquire more closely into the methods by which it is proposed to secure the improved highways, the need for which is now generally acknowledged. Automobile owners have every reason for interesting themselves in this aspect of the situation, largely because they are called upon to make substantial contributions for construction and maintenance.

Although several bills have been introduced into Congress, practically the only money which the United States government has appropriated for improved roads was that made available as

a part of the postoffice appropriation act of August, 1912, when provision was made for expending \$500,000 under the direction of the Secretary of Agriculture, in co-operation with the Postmaster-General, for the improvement of post roads. It is required by the act that the state or local sub-division in which the improvement is made shall appropriate twice the amount allotted by the federal government, and that the joint fund thus created shall be spent entirely under the direction of the Secretary of Agriculture.

The office of public roads, a bureau of the Department of Agriculture, is authority for the statement that an effort was made to allot this appropriation equally to all of the states, but this was found to be impracticable. The reason for this decision is not hard to understand, since there are 48 states, each of which would have been entitled to but \$10,000. Instead, the allotments have been made with a view to ascertaining the probable cost of post road construction in various sections of the country. Ohio, for instance, is understood to have drawn \$120,000, or practically one-fourth of the entire appropriation. This is to be expended on the national pike, first constructed by the federal government in 1836 and 1837 as a military post road.

This step is an important one, because of its bearing upon the entire question of federal construction and supervision of highways. It should be followed by motorists and others, because the general public will sooner or later be called upon to make decision as to whether this plan shall be continued or some other method shall be adopted.

Motorists are promised that the subject of uniform motoring laws will receive decided attention at the forthcoming convention of commissioners on uniform state laws, to be held in Montreal. Each state in the union will be represented by duly accredited delegates appointed by the governors of the several commonwealths. There can be little doubt that even an informal discussion of the need for uniform motoring laws among men who are clothed with some authority from the various states will be of benefit. However, it is extremely unfortunate in some respects that whenever conventions of this type are held the delegates from the United States always find themselves absolutely without authority to take definite action.

## STUTZ WINS AT SANTA MONICA.

**Earl Cooper Takes His Third Long Distance Road Race for the Season—Barney Oldfield and Louis Nikrent, Driving Mercers, Finish Second and Third.**

**I**N WINNING the Santa Monica road race of 1913, Earl Cooper not only has created for himself an enviable reputation among the racing drivers of the year, but he has established the Stutz car as a worthy contender for premier honors in a field comprised of some of the fastest makes of machines in the world. This was the third great victory for Cooper and the Stutz on the Pacific Coast this season. July 5, he took the 220-mile race for the Potlach trophy at Tacoma, Wash., only to follow this with the Montamara-thon award, July 7, over the same course, this latter event being for 250 miles.

This year, the road race over the course at Santa Monica, Cal., was for 445 miles, Cooper's

time for the distance being 6:01:52. In this respect the event ranks in importance with the 500-mile contests on the Indianapolis speedway. If memory serves correctly, it was the longest race of this character held in this country. And for this reason, and because the cars

were limited to 600 cubic inches piston displacement, it was not expected that the speed would prove record breaking. Cooper's average was 73.8 miles an hour.

In 1910, Teddy Tetzlaff in a Lozier covered the 202 miles at an average speed of 73.22, which at that time was a new American road-racing record. In 1911, Harvey Herrick in a National covered the 202 miles at a speed of 74.63, a new world's record. Last year, Tetzlaff regained the honors lost in 1911, this time driving a Fiat 303 miles at a speed of 78.5 miles an hour, which figure is still the world's record. Tetzlaff's Fiat had a piston displacement of 904.7 cubic inches, against 400.2 for Cooper's Stutz this year. Cooper

was a contender last year, also in a Stutz, and was running in fourth place when the race was called.

Barney Oldfield, driving a Mercer, finished second in this year's race, his time being 6:07:45. Louis Nikrent in another Mercer was third, in 6:28:17. Four other cars were running when the race was called immediately after Nikrent crossed the finish line. Frank Verbeck in a Fiat completed 49 laps in 6:23:17; E. F. McConnors in a Speedwell, 43 laps in 6:23:14; Charles Soules, Cadillac, 39 laps, 6:07:11, and T. J. Beaudette, Cadillac, 36 laps, 6:24:44. The race was for 53 laps of the course, and the other cars entered were: Gaston Morris, Berlin special; Harris

Hanshue, Apperson; Teddy Tetzlaff, Fiat; Dave Lewis, Stutz; John Opsahl, Buick; Frank Goode, Apperson, and Frank Siefert, National.

It was a great race from start to finish, with nearly all the California favorites in the running. Hanshue won the first Santa Monica with an

Apperson. Tetzlaff had been a winner twice. Verbeck was fresh from his victory in the Los Angeles-Sacramento event of July 4. Even Barney Oldfield was there. The spectators were assured of all the speed of which the cars were capable.

Oldfield and Cooper took part in a splendid battle for leadership. With less than 100 yards separating them on the next to the last lap, the Stutz slowed up at the pits for a tire change. The Mercer rounded the turn almost on two wheels and went into the straightaway with a rush. For the first time Cooper lost his cool composure when his mechanic failed the third time to send the rim home. Jumping from the car,

**Earl Cooper, Winner of the Fifth Annual Santa Monica Road Race, Crossing the Finish Line in His Stutz.**

**Barney Oldfield and His Mercer, Second Place Combination, Taking the Straightaway in Pailsades Avenue.**

Cooper took the rim and sent it into place with a jerk. In the meantime Oldfield had met with similar trouble on one of the back turns, and the Stutz rolled home a winner by nearly six minutes.

While the two leaders were battling for first place, Nikrent in a second Mercer, Goode and Hanshue in Appersons and Beaudette in a Cadillac, were fighting for third place. The pace proved too much for the winner of the first Santa Monica, however, and he was forced to withdraw. Goode then took the lead in this section and seemed to have an excellent chance of finishing something better than third.

The next round of the course Goode failed to appear. The wait stretched into minutes, and still no Apperson. At last Goode drove up to the pits, exclaiming, "It's all off. I took on gasoline on the back stretch out of a control pit, and I failed to ask the referee for permission."

His friends urged him back into the race, and soon he was under way again. He finished in fourth place, right behind Nikrent in the Mercer. Then arose the question of his disqualification, and several of the drivers were ready to enter a protest. Referee Wadhams settled the controversy by declaring, "You were automatically disqualified." When the situation had cleared somewhat, it was realized that Goode had played the part of a true sportsman, and all talk of protest was dropped at once.

Last year, Earl Cooper and the Stutz were entered in six

events, in four of which he finished in first place. One of his victories was a 150-mile race at Tacoma, Wash. The Stutz and Mercer teams have been striving for premier honors during the past two seasons. Cooper appears to be doing his full share toward placing the former at the head of the list. In view of his splendid achievements thus far this year, it will not be at all surprising to see him at the wheel of a Stutz car in some of the big races yet to be held, notably the Elgin events of Aug. 29-30, the speedway meet at Corona, Cal., Sept. 9, and the Vanderbilt Cup and Grand Prize races in Savannah, Nov. 24 and 27.

### WILBUR WINS FREE-FOR-ALL.

#### Rickenbacher in a Mason Takes Three Events in Chicago Meet.

The race meet at the Libertyville track, Chicago, Aug. 9, was well attended and some interesting races were run. Eddie Hearne in a Case proved a winner in the event for Chicago cars, F. C. Wilbur in a Mercer took the free-for-all and Eddie Rickenbacher in a Mason returned a victor three times. The summary:

#### Five Miles, Chicago Cars.

| Car    | Driver | Time    |
|--------|--------|---------|
| Case   | Hearne | 5:43.05 |
| Mercer | Wilbur | .....   |

**Frank Verbeck in Fourth Place Flat, Trying to Pass Louis Nikrent in Third Place Mercer.**

### PROVIDENCE WINS AWARD.

**Waite Auto Supply Company Gets Capital Prize in Weed Tire Chain Contest.**

In the contest concluded by the Weed Chain Tire Grip Company, New York City, in which 12 prizes were offered, totalling \$250, for the best trimmed windows arranged by supply and accessory dealers, the first prize of \$100 went to the Waite Auto Supply Company of Providence, R. I. This concern dressed its window to represent a village with houses, roads, railroads and dangerous grade crossings, a snow scene and other effects. In this setting was woven the

DePalma in Mercer Leading Wishart in Another Mercer and LeCain in Stutz at the Finish in Recent Brighton Beach Meet.

DePalma in a Mercer car took five of the six events, and Spencer Wishart in another car of the same make took the sixth. Mercers also finished in second place four times and in third twice. It was not a Mercer meet, exactly, since several other makes of machines competed in each of the six events. The results follow:

|   |          |         |

danger of skidding and the safety of Weed chains. Following is the complete list of winners:

First, \$100, Waite Auto Supply Company, Providence, R. I.; second, \$50, Bannister & Pollard Company, Newark, N. J.; ten prizes of \$10 each, Tri-State Supply Company, White Plains, N. Y.; Albert E. Goodby, Providence, R. I.; Hamilton Hardware Corporation, Waterbury, Conn.; Blue Ribbon Garage, Bridgeport, Conn.; Herr & Co., Lancaster, Penn.; Post & Lester Company, Boston, Mass.; Louisville Auto Supply Company, Louisville, Ky.; Dayton & Walker Hardware Company, Paterson, N. J.; Ferris-Dunlap Auto Supply Company, Dallas, Tex.; Bl-Motor Equipment Company, Boston, Mass.

Moved to action by the apparently increasing motor car accidents caused by speeding automobiles, Commissioner of Motor Vehicles Lippincott of New Jersey has urged the co-operation of all the police departments of the state in letters which he has sent out, setting forth that it was impossible for him to do more than exercise general supervision over the principal highways.

## RECENTLY ANNOUNCED 1914 MODELS.

### Packard Adopts Worm Bevel Gear Drive—Church Features Pneumatic Transmission— Marion Brings Out a Six—Two-Speed Rear Axle on Cadillac.

**W**HILE The Automobile Journal desires to present full details of the season's new models as early as possible, lack of space prevents extended comment on each of these immediately after they are announced by the manufacturer. In addition to those more fully described in this issue, the following announcements have been made recently, attention being directed particularly to the more important features:

**Packard**—The Packard Motor Car Company, Detroit, is soon to produce new 38 and 48 horsepower models which will incorporate a new type of worm bevel gear drive. It is explained that this drive will comprise a bevel gear and pinion having teeth which bear the same relation to ordinary bevel gear teeth as do the teeth of

full floating rear axle; tires, 36 by 4.5 inches; wheelbase, 128 inches. Equipment includes Westinghouse electric lighting and starting systems, demountable rims and one extra rim.

**Abbott-Detroit**—Abbott Motor Company, Detroit. Belle Isle model, three-passenger roadster and seven-passenger touring. Motor, six-cylinder, rated at 50-60 horsepower. Standard equipment includes electric lighting and starting, with separate motor and generator units, and magneto ignition. Other models in the line will include 34-40, four-cylinder, five-passenger touring car and roadster; 44-50, four-cylinder seven-passenger touring, five-passenger demi-tonneau and three-passenger roadster.

**Allen**—Allen Motor Company, Fostoria, O. Model 40 five-passenger touring car. Motor, four-cylinder, en bloc, 4.125-inch bore, five-inch stroke; unit power plant, three point suspension; thermo-syphon cooling; constant level splash lubrication; Splitdorf dual magneto; multiple disc clutch, lined with Raybestos; three-speed transmission; full floating rear axle; semi-elliptic springs forward, three-quarter rear; 34 by four-inch tires; left hand drive,

**Allen Five-Passenger Touring Car, Having Four-Cylinder Block Motor, Rated at 40 Horsepower.**

the now familiar spiral or helical spur gears to ordinary spur gear teeth.

**Church**—The Church Motor Car Company, 2019 Michigan avenue, Chicago, has placed in the market a new car embodying the Church pneumatic system. The motor is a four-cylinder, two-cycle unit, cast en bloc, with bore of 3.5 inches and stroke of five. Connection with the propeller shaft is through a rotary air pump, which takes the place of both clutch and transmission, at the same time precompressing the air used in the motor cylinders, the fuel being injected later. Two bodies, a four and a six-passenger, will be fitted. Equipment includes electric lighting, air starter, tire inflator, air jack, etc.

**Palmer-Singer**—Palmer & Singer Manufacturing Company, Long Island City, N. Y. Model K Brighton Six; two-passenger roadster, four-passenger toy tonneau, five-passenger touring. Motor, six-cylinder, cast in three, four-inch bore, five-inch stroke, rated at 45 horsepower; ignition, Eisemann dual high-tension magneto; lubrication, combined splash and pump system; three jet carburetor; multiple disc clutch, three speeds forward and reverse;

centre control; Auto-Lite electric starting and lighting, demountable rims with one extra rim. Roadster will be built on same chassis.

**Marion**—Marion Motor Car Company, Indianapolis, Ind. Marion Six models G5, five-passenger touring, and G2, two-passenger roadster. Motor, six-cylinder, L head, cast in three, 3.75-inch bore, 5.25-inch stroke; lubrication, combination force feed and automatic level splash, in which conventional breather pipe is eliminated; Westinghouse lighting and starting system, with drive direct to the front end of the crankshaft through silent chain at a reduction of 15:1; magneto ignition, multiple dry disc clutch, Marion type rear system with three-speed transmission rigidly bolted to differential housing, left hand drive, centre control.

**Cadillac**—Cadillac Motor Car Company, Detroit. The chief feature in the new model is the use of a two-speed direct drive rear axle, which has a low speed ratio of 3.66:1 and a high speed ratio of 2.5:1. It is maintained that with an engine speed of 700 revolutions a minute the low gear direct drive will give a car speed of 21

miles an hour and the high 30. The change in speeds is effected by means of an electric switch. Other details have not been made public as yet.

**Victor Cyclecar**—Victor Motor Car Company, 271 Diamond street, Philadelphia, Penn. Two passengers, side by side. Motor, four-cylinder, water-cooled, 3.25-inch bore, four-inch stroke; cone clutch, three speed selective sliding gear transmission, bevel driven rear axle, wire wheels, 30 by three-inch tires, wheelbase 90 inches, tread 52. Equipment includes top and windshield.

**Downing-Detroit Cyclecar**—Downing-Detroit Cycle Car Company, Detroit. Two passengers, tandem. Motor, two-cylinder, air-cooled, V, 3.5-inch bore, 3.67-inch stroke, rated at 12 horsepower; ignition, Bosch high-tension, armored type magneto; carburetor, Schebler; transmission, two speeds forward and reverse; semi-elliptic springs front and rear; tires, 28 by 2.75 inches; wheelbase, 103 inches; tread, standard, 56 inches.

### RUBY PORTABLE GARAGE.

**Constructed Entirely of Steel to Provide Against Fire, Weather and Theft.**

The practicability of the portable garage is demonstrated by the fact that something over 35,000 are being used throughout the country.

Two Views of Ruby All-Steel Portable Garage and Method of Assembling the Various Sections.

Extended service also has indicated the value of these structures as permanent buildings, since by their use the probability of the garage being a total financial loss should the home be sold, is eliminated, the building being transported readily and having a market value at all times.

The Kolb Sales Company, United States Rubber building, New York City, is distributor for the Ruby all-steel garage, which is of the sectional type. The buildings are very complete, including provisions for windows, doors, work bench frames, etc. The material is heavy galvanized steel, 28 gauge stock being used in the side and end walls and 26 gauge on the roof. The sections are formed by electrically welding the galvanized steel on one by one-inch steel angle frames. The sections or panels are grooved in the frame and are fitted into place by stationary clips on the horizontal rail which forms the tongue. The edges of the sections also engage on the tongue and groove principle, forming airtight joints. No bolts or screws are used, ex-

cept two locking bolts at the extreme ends of the wall.

The doors of the standard garage are eight feet high by seven feet wide in the clear. The swinging doors are each hung on three six-inch extra heavy pressed steel hinges. The windows are of approved fireproof construction and occur in two of the sidewall sections. These are 21 by 34 inches, set in a galvanized steel frame, and are glazed with four nine by 16-inch lights .3125-inch thick, ribbed and run in fine wire mesh. Inasmuch as the sidewall sections are interchangeable, the windows may be placed where desired.

It is interesting to note that these buildings can be furnished to meet almost any requirement, being made practically to specifications. The standard sizes run all the way from nine feet eight inches by nine feet eight inches to 21 feet four inches by 28 feet four inches, and to accommodate from one to six cars. They also are made to house motorcycles, motor boats, etc. No

flooring is supplied, this usually being constructed of concrete, but substantially everything else is furnished, including a Yale burglar proof padlock and keys.

C. M. Smith, a theatrical man in San Francisco, Cal., recently left Los Angeles for New York City, as the result of wagers aggregating \$7500 that he would not reach the Atlantic port within 60 days. The machine is equipped with Miller tires, made by the Miller Rubber Company, Akron, O., and one of the wagers is based upon the ability of these tires to carry the car the entire distance without puncture or blow-out. Mr. Smith is accompanied by his wife and R. E. Hilton, the latter being official observer and representative of the other parties to the wagers. He expects to arrive in New York about Sept. 10.

The ministers of Lima, O., are planning a unique religious campaign in which motor cars will be used for pulpits on street corners, etc.

## CORRESPONDENCE WITH THE READER.

**Mercer Piston Rings.**

(1631)—Will you inform me as to the number of rings used on the piston of the Mercer cars, and the way the wristpin is secured?  
Waco, Tex., Aug. 15.

SUBSCRIBER.

The pistons of the Mercer motor differ from conventional practise in that only two rings are fitted, but the company points out that the design and method of fitting these members is one of the factors entering into the efficiency of the motor. The rings are placed above the wristpin, as will be noted by the illustration presented at Fig. 1. Instead of being turned eccentric they are the same thickness all the way around, then peined in a special machine which automatically provides an even tension at all points. In addition to improving the compression the construction makes for a lighter piston, which is of cast

**Fig. 1—Showing Two-Ring Piston Utilized in Mercer Motor and Method of Retaining Wristpin.**

iron, ground to size. The wristpins are hollow, of an alloy steel, hardened and ground, and oscillate in bosses. The piston attached to the connecting rod, also displaced and with rings removed, is shown in the illustration.

**Leaks in Pressure Feed System.**

(1632)—Some time ago I purchased a second-hand car having a pressure feed fuel system. I find it difficult to keep the pressure up to a pound even when the machine is running at good speed. Although it has been worked on by several repairmen, the results obtained are satisfactory for a short time only, and I have to use the hand pump every few miles. Can you suggest some remedy?  
Cranston, R. I., Aug. 11.

C. T.

With a pressure feed system it is essential that all joints and connections be perfectly tight. The fact that the pressure falls off rapidly indicates a faulty connection which probably vibrates loose, as the system worked satisfactorily after

it was overhauled and repaired.

An excellent method of locating the leak is to pump up the pressure to about two pounds and mix up a solution of soap and water. Apply the fluid with a brush to each joint and connection and note if any bubbles are given off. If any exist, disassemble the part and examine it, replacing with new if found faulty.

It may be that the check valves are dirty, especially if the system provides for utilizing the pressure of the exhaust gases. Remove the pipes and test them, also clean the valves. Generally, pressure feed systems have a regulating valve, adjusting which may cure the trouble, providing leaks are not discovered by the soap treatment. The check valves may be tested with gasoline. Excessive lubrication of the motor may be responsible for some of the trouble mentioned.

**Adjustable Valve Tappets.**

(1633)—Can you suggest some method whereby I can make my valve tappets adjustable? I have tried several devices advertised for this purpose, but have not had any success. The tappets are very noisy. Is there any method of eliminating the clatter?  
Bayonne, N. J., Aug. 13.

NEW READER.

The easiest repair would be to fit new parts, but this would involve more or less expense, depending upon the design of motor, which was not mentioned. Three methods of converting tappets into adjustable members, as well as making fibre inserts to eliminate noise, are shown at Fig. 2, and the suggestions may be of service.

The sketch at 2 shows a method of making a tappet adjustable. In this instance the tappet guide extended above the crankcase and the pushrod was of solid construction. The guide was shortened slightly and the tappet annealed to permit of cutting off a section, also to drill and tap a thread as illustrated. A hex set screw was screwed into the tappet and locked in the desired position by a lock nut. The head of the screw was recessed, as shown by the dotted lines, to take a piece of fibre. This material was placed in the screw member and hammered until hard, then smoothed up with a file. Of course, care should be exercised in reducing the length of the tappet, and the thickness of the screw member, lock nut and fibre insert must be considered. With this method it will not be necessary to reharden the tappet unless the temper has been completely drawn.

Another method of quieting a noisy tappet is shown at 3, which also depicts the fitting of a non-adjustable tappet, with means for setting.

Here the tappet is drilled, as shown by the dotted lines, and the fibre turned for a drive fit and forced into position, after the material is trued up with a smooth file. This method is preferable where the head of the tappet member is larger than the diameter of the valve stem, and where the latter strikes in the centre of the tappet.

While at first glance it would appear that on some types of motors, there is insufficient space to permit of the addition of a set screw and locking nut, it usually can be accomplished by cutting off the pushrod bushing, if it extends above the crankcase wall, or by shortening the rod or valve stem and valve spring. This can be determined by measurement. If there be space enough it will only be necessary to remove the pushrod and bushing or guide, and to treat these members

make the work easier. Start with the top ring, removing this member by slipping it over the tin strips. The other rings are removed in order. In replacing them the order is reversed, the lower ring being put on first. The rings should be replaced in their original positions.

#### Jacks for Car.

(1635)—Am using my machine but once a week, employing it to run between my country residence and the depot. I understand that it is best to jack up the wheels to save the tires. As it would involve some expense to buy jacks I would be pleased to have you suggest some method of constructing an inexpensive jack. Unless I am mistaken, you published an illustration of a home-made jack some time ago, but I cannot find it in my files of The Automobile Journal.

F. E. T.

Charlestown, R. I., Aug. 17.

The article referred to was published in the issue of The Automobile Journal for Jan. 25, in

Fig. 2—Illustrating Methods of Inserting Fibre in Tappets to Eliminate Noisy Action, also Plan of Converting Tappets into Adjustable Members.

as described. Drawing at 1 shows another method. In this instance small discs of fibre were inserted in the plunger or tappet and the valve readjusted. After inserting fibre and running the car for some time, it will be necessary to readjust the tappets, as the fibre will be contracted more or less by hammering of the valve stems.

#### Displacing Piston Rings.

(1634)—What do you consider the best and safest method of removing rings from a piston?

Baltimore, Md., Aug. 16.

AMATEUR.

The removal of piston rings requires care, as they are very fragile and easily broken. There are several devices marketed for the work, but the writer favors using strips of tin. These are cut to suit the piston and inserted between it and the ring. Three will serve, but four will

the serial on equipping the private garage. The axle support or jack is reproduced at Fig. 3 and is made easily by following the working plan. Two-by-four joists are utilized, six pieces being required. The first step is to cut two members and fasten together as shown at A. The member B is recessed at one end, as indicated, and the wheels measured to provide for the proper height. This may be accomplished by measuring from the centre of the hub cap to the ground and adding about three inches, so that the tires will clear the floor when the supports are placed in position.

Four of these supports are necessary, one for each wheel, and when the chassis is raised from the floor they not only relieve the tires from all weight, but will be decidedly handy when working on the steering gear, motor bearings, etc.

The plan of jacking up the car when not in service is to be recommended.

#### Second-Hand Cars.

(1636)—Am contemplating buying a second-hand automobile and read the advertisements very carefully. I note that second-hand Fords, model T, are scheduled at prices considerably out of proportion to their cost; that is, the seller asks within \$200 of the first cost. I note that a number of other makes which originally sold for \$2000 and \$3,000, for example, can be bought for less than one-quarter of the first cost. Why is it that a Ford car brings more money second-hand than the machines mentioned? Is it because it is a better car and the others are not as good?

Boston, Aug. 16.

BUYER.

The law of supply and demand, especially the latter, may be applied to the point in question. The price obtained by any make of second-hand car depends largely upon the demand, and according to dealers in second-hand machines, there is a ready market for the Ford product; in fact, some dealers advertise for these. The

Fig. 3—Working Plan of Support for Axles When Car Is to Be Jacked Up.

other cars mentioned are listed at a low price because they do not find a market as readily as the smaller machine. It will be noted that there are always certain makes which are valued higher by a second-hand dealer than machines originally listing at the same price and more. This is largely due to the fact that there is a greater demand for the first-named cars.

#### Warren-Detroit Parts.

(1637)—Are there any companies manufacturing parts for the Warren-Detroit "30"? I understand that the concern is in the hands of a receiver.

Media, Penn., Aug. 11.

R. A. H.

The plant of the Warren Motor Car Company was sold at auction to W. C. Rands of the Rands Manufacturing Company, Detroit. It is possible that parts could be obtained from this concern,

or information secured as to where they could be purchased.

#### Spark Plug Troubles.

(1638)—Am having considerable trouble with the spark plugs in my motor, which is of the T-head type. The ignition system is a double one—batteries, timer and a coil for the plugs over the exhaust valves, and a true high-tension Bosch magneto for the intake valve plugs. The latter give but little trouble, but those over the exhaust members get badly sooted and covered with oil. This makes it difficult to start the motor, as I cannot spin it on the magneto. As a result I have to keep cleaning plugs. A repair man says I am using too much oil, which may be true, but I do not dare to use less and am following the instructions of the car maker. Can you suggest any remedy?

W. K. A.

New Britain, Conn., Aug. 14.

The repairman is doubtless correct in his diagnosis—too much oil. It may be that the mixture is too rich, which with excessive lubrication would cause the trouble referred to. If the plugs over the exhaust valves foul rapidly and are covered with oil, it would indicate that too much lubricant were being used or that the grade of oil did not best meet the requirements of the motor. If the trouble is present in all cylinders, it may be assumed that the amount could be cut down with safety. If the plugs of the front cylinders do not give trouble, it may be assumed that the rings leak or the crankcase of motor is lower at the rear than at the front, causing flooding of the rear cylinders. Place the car on a level floor, remove the inspection plates and examine the height of the lubricant in the crankcase under first and last cylinders. This suggestion is made in the event the oiling system is of the splash type.

The proper location of the spark plug is important; that is, the gap should not extend too far into the combustion chamber or be pocketed. By running the motor on the battery a few minutes before stopping the car may burn off the deposits on the plugs, and make starting much easier. Difficult starting is not always due to the plugs.

Six weeks of touring in Europe over 3000 miles in Italy, France, England and Wales was a journey recently completed by F. H. Wellcome, of Minneapolis, Minn., in a White seven-passenger touring car. Mr. Wellcome was accompanied by five passengers and a chauffeur, and his car carried six suit cases in addition to a trunk in the rear. Speeds as high as 65 miles an hour were made on some of the fine roads in southern and central France. The longest day's run was 175 miles, crossing the mountains between Avignon, on the Rhone river, and the town of Ambert. Mr. Wellcome reported that no trouble had been experienced throughout the entire journey.

## WITH THE MOTORING INTERESTS ABROAD.

### Bablot Takes the Sarthe Cup in a Delage Car---New Electric Motor Starter Recently Produced in Great Britain---Argyll's Comparative Fuel Test.

**B**ABLOT, a well-known French driver, won the 336-mile race for the Sarthe cup, under the auspices of the Automobile Club de France, Aug. 5. Bablot drove a Delage car, his time for the distance being 4:21:50, and his average speed 76:98 miles an hour. Guyot, who competed in the last 500-mile race on the Indianapolis speedway, driving a Sunbeam car of British make, was second in another Delage, his time being 4:26:30. Pilette, still another Indianapolis contender, was third, in a Mercedes, in 4:27:53. Five other cars finished in the following order: Salzer, Mercedes; Duary, Delage; Lautenschlager, Mercedes; Thoms, Schneider; Elashamp, Mercedes.

Just before the start of the race the two Peugeot cars which finished first and second in the Grand Prix of last month were withdrawn. Boillot and Goux, who drove these machines in the Grand Prix, were slated to pilot them in this event, which was held over the Amiens course. No reason was given for the action, but with these machines out of the running the event narrowed down to a contest between the Delage and Mercedes entrants. The latter was seen in a French road race for the first time since Lautenschlager won the Grand Prix of 1908. All of the cars which finished were fitted with Bosch magnetos, and seven of the eight used Bosch plugs.

#### LEYLAND PUMPING ENGINE.

#### Interesting Machine Built in England for Service in Shanghai, China.

Only a few years ago, the school geographies and books of travel did much to impress the gen-

eral public with the idea that conflagrations in China were fought with the old-fashioned hand cart, which was dragged through the streets, accompanied by a man beating a peculiar kind of drum. The accompanying illustration should help dispel this illusion, since this machine is the very latest type of gasoline pumping engine, made by the Leyland Motors, Ltd., Leyland, Lancashire, England, for the fire department in Shanghai, China.

The chassis is the standard gasoline model produced by this concern, although the company is somewhat better known as a manufacturer of steam carriers, having been engaged in that branch of the industry for many years. The

Leyland Gasoline Pumping Engine with Rated Capacity of 450 Gallons, for Service in Shanghai, China.

motor is a four-cylinder unit, with bore of five inches and stroke of 6.5, rated at 55 horsepower. This not only propels the machine, but drives the Reese-Roturbe rotary pump through a geared layshaft from the top of the transmission casing. The pump is of the four-stage centrifugal type and has provision for taking three lines of hose. It has a rated capacity of 450 gallons of water a minute.

The equipment is complete in every way, provision being made for carrying a full crew of men, as well as a supply of regulation fire hose, ladders, etc.

## BRITISH ELECTRIC MOTOR STARTER.

**S**TATISTICS of the last Olympia show at London, England, revealed the fact that electric motor starting was not favored by the English manufacturer of accessories or equipment. It should be borne in mind that the purchaser is expected to buy his equipment, a practise decidedly in contrast to the methods in vogue in this country. In view of the attitude toward motor starters in England, the announcement of the United Motor Industries, Ltd., London, of an electrical unit is of interest.

The U. M. I. Magician starter, as it is termed, does not employ clash gearing, roller clutches or ratchets, nor is it permanently connected by means of gears or chains to the rotating parts of the motor. As will be noted by an accompanying illustration, a friction roller is moved into contact with the periphery of the flywheel of the engine through depressing a pedal, which also

U. M. I. Magician Electric Motor Starter, an English Design Utilising Friction Roller for Rotating Fly-wheel of Engine.

actuates a switch. Releasing the pedal cuts off the supply of current to the electric motor, the friction wheel oscillating back out of contact by means of a tension spring.

The motor is of .5 horsepower capacity, 10.5 by 6.75 inches, and is located as convenient on the chassis. Current is supplied by a 12-volt battery, and the motor rotates at about 2700 revolutions a minute. A reduction gear, reducing the speed to about 18:1, is utilized, and drive is taken through a shaft fitted with a universal joint connected with a free wheel. The friction roller is brought into contact with the periphery of the flywheel by means of a cable connection with the pedal. The crankshaft of the motor is rotated at about 150 revolutions a minute. Beyond

this rate, and when the motor operates under its own power, the friction wheel rotates idly because of the free wheel. A complete release of the pedal cuts off the current and the roller returns to normal position as explained above.

It is stated by the maker that the system is applicable to any gasoline car; that the shaft may be made any desired length, and that the friction roller may contact with any rotating part of the car engine. Another feature claimed is that it may be fitted without alteration to the power plant or transmission housing.

### COMPARATIVE FUEL TEST.

#### Interesting Demonstration with Argyll Sleeve Valve Car on Brooklands Track.

On the occasion of the recent visit of the Imperial motor traction congress to Brooklands track, England, an Argyll sleeve valve car, made by Argylls, Ltd., Alexandria, Scotland, ran a comparative test on gasoline and benzole. The model selected was a 15.8 horsepower roadster, a duplicate of the chassis which recently created world's records on the same track. The machine ran a half-hour on gasoline and immediately afterward another half-hour on benzole without adjustment or alteration.

It was arranged to maintain an average speed with a full complement of passengers, the object being not to make a speed demonstration, but to elicit figures which would interest the ordinary motorist. With gasoline, the distance covered was 15 miles, 3.5 quarts being used, and with benzole the distance was 15 miles, one furlong, the fuel consumption being 2.5 quarts.

### CREATES WORLD'S RECORDS.

#### British Humber Car Makes New Marks for Distances Up to 200 Miles.

An 11 horsepower Humber car, made in England, Tuck driving, recently created new world's records for its class on the Brooklands track, Weybridge, England. It already held the shorter distance marks in the British class B, which has piston displacement limits somewhat less than any American class. There are no American records for the smallest class (less than 160 cubic inches) for distances greater than 20 miles.

The Humber exceeded the records formerly held by an Arrol-Johnston for distances from 50

to 200 miles, and but for the failure of water circulation and a broken valve spring, it is assumed that it would have had little difficulty in making a new 300-mile mark. It also took the records from one to six hours, its performances being tabulated as follows:

| Miles | Time       | M.P.H. |
|-------|------------|--------|
| 50    | 46:08.80   | 65.01  |
| 100   | 1:28:56.02 | 67.47  |
| 150   | 2:13:56.71 | 67.19  |
| 200   | 2:57:05.57 | 67.76  |
| Hours | Miles      | Yards  |
| 1     | 66         | 286    |
| 2     | 136        | 134    |
| 3     | 203        | 546    |
| 4     | 272        | 1606   |

#### NEWS NOTES FROM ABROAD.

At the completion of the new transportation building at Hastings park, Vancouver, B. C., it will be opened Aug. 30, with an automobile show.

It is announced that the international automobile convention has been ratified by the government of Montenegro and that international travelling passes are now valid for cars touring in that country.

For the last three years the annual export of ball bearings from Goteborg, Sweden, to the United States has increased at a remarkable rate, the values being \$12,042 in 1910; \$35,000 in 1911, and \$196,705 in 1912. A great deal of the machinery used in the manufacture of these bearings is of American make, including the gas forges, lathes and grinders.

An American consular officer in a European country reports that a well-known representative of various machinery houses desires to secure the agency for a first-class American automobile. He wishes to correspond with manufacturers and only those who build cars upon a large scale. Information may be obtained of the bureau of foreign and domestic commerce, Department of Commerce, Washington, D. C., by referring to file No. 11,453.

The members of the British Institution of Automobile Engineers who took part in the recent visit to the United States have now all returned to England. A paper will be read at the November meeting of the Institution embodying the result of the observations of the various members of the party, and it is expected that several members of the American Society of Automobile Engineers, who will be in London on a visit to the motor show at Olympia, will be present at the meeting to take part in the discussion.

The various city departments of Birmingham, England, own and use 28 motor cars, which cost, with accessories, \$58,656, or an average of \$2093 each. The estimated yearly cost of running, including wages, uniforms, etc., is \$14,133. Including depreciation, the total cost is calculated at \$32,518 a year, or an average of \$1161 for each car. It is calculated that these machines average 9434 miles each and cost 12 cents a car-mile. They have displaced seven men, six horses and nine vehicles at an annual saving of \$7619.

The Royal Automobile Club of England announces that the next Tourist Trophy race will be held in the Isle of Man in June, 1914. The regulations will be issued shortly. These are to be in accord with the views of the club and the Society of Motor Manufacturers & Traders and have been approved under the bond of the society. The race will be a two-day event for cars fitted with four-cylinder internal combustion engines, about 300 miles being run each day. The rules call for stock cars, with minimum wheelbase of 108 inches, tread of 54 inches, body width, 40 inches. Any kind of fuel will be permitted, a sample of which must be furnished to the club 14 days previous to the race.

A daily motor service has been inaugurated between Huelva, Spain, and Ayamonte, a town on the Portuguese

frontier, whence connections may be had for the southern railways of Portugal. The distance is 37 miles, and at present but one trip is made daily, although this may be increased. Hitherto the only means of transportation has been by stage coach, and the new service doubtless owes its installation in part to the efficient, popular and profitable operation of a similar line between San Fernando, near Cadiz, and Algeciras, Spain.

The Coupe de l'Auto race will take place on the Boulogne circuit, Sept. 21. The entries closed July 31, but additional entries will be received until Aug. 31 on the payment of double fees. Two cars have been entered by the Sunbeam Motor Company of England, and in addition to the Sunbeams there will be three Peugeot machines, one driven by Bollot and the other by Goux; four Koechlin cars, one of which will be piloted by A. G. Koechlin, and three Th. Schneider machines, the drivers of which are not named. There also will be two cars each of Delage and Zenia makes, the drivers specified for the former being Guyot and Babilot, and for the latter, Guyot and Briard.

#### INTERNATIONAL AVIATION RACE.

##### Weymann and Kantner Expected to Represent America—Rules for 1914.

While the Aero Club of America has until 24 hours before the running of the fifth international aeroplane race for the Gordon-Bennett cup at Villacoublay, France, Sept. 29, it is pretty generally conceded that Charles Terres Weymann, winner of the third race, and Harold Kantner of Meadville, Penn., will represent the United States. Each country is entitled to three representatives. Weymann flies a Nieuport monoplane, while Kantner is now abroad engaged in the construction of a Kantner-Moisant monoplane for this flight.

An important conference of the Federation Internationale Aeronautique was held recently in Scheveningen, Netherlands, at which America was represented by Cortlandt Field Bishop, Charles Terres Weymann, Campbell Wood and Dr. Eberhardt. The object of the meeting was to consider rules for the sixth international race in 1914. Mr. Weymann suggested that competitors be required to pass a preliminary test consisting of a straight flight over a course of two kilometers and return, the speed to be taken both ways, the result to be a mean speed of not more than 70 kilometers (42 miles) an hour. This test is expected to demonstrate the safety of the machine. The suggestion was adopted.

The federation also ratified the draft of the treaty regulating international aerial traffic adopted at the Brussels meeting, and a committee reported that the Belgian government had forwarded the treaty to the French government with the request that it consider the desirability of calling an international conference to consider the subject.

## MOTORIZING LAWS AND THEIR ENFORCEMENT.

Connecticut Press Expresses Its Views on New Universal Lighting Statute—Patent Association Enters Protest Against Oldfield Bill in Congress.

CONNECTICUT has a new law covering the use of lights on all vehicles using highways during the hours of darkness. Connecticut is the "Land of Steady Habits." The new law exempts vehicles without springs, in which respect it differs somewhat from similar statutes in other commonwealths. In some other respects, the new requirement is meeting with the same objections as those which have prevented the enactment of such safe and sane legislation in other sections. The new law went into effect Aug. 1, and reads as follows:

All vehicles, other than motor vehicles, having springs or rubber tires while in use in the public streets and highways, except highways or portions thereof lighted all night by any municipality, shall show, from one hour after sunset until one hour before sunrise, a light or lights so placed as to be visible from the front and rear of such vehicles. Such light or lights shall be of sufficient illuminating power to be visible a distance of 200 feet. Any person driving or directing any such vehicle upon a public street or highway between the hours aforesaid without a light shall be fined not more than \$5. The court before which the accused is tried may suspend judgment or remit the penalty provided herein whenever in its judgment the circumstances will warrant such action.

It would appear that extreme care had been taken by the legislators to insure that no injustice should be done. It is of interest, however, to note the different views upon the subject held by the press of the Nutmeg State. Says the Hartford Courant:

Hereafter (automobiles being already covered by existing law) all vehicles on highways, if they have springs, must show lights, visible from front and rear at least 200 feet, from one hour after sunset to one hour before sunrise. Heretofore legislatures have refused any such law because the members from the country said it meant lights on haycarts. As the modern haycart has no springs and also is seldom out after dark, it follows that such are immune. But, when the hired man hitchies up the old mare to go and see his girl, he must rig a couple of lights or run the risk of a fine. This new law is the plainest sort of common sense. Maybe we shall some day have swimming set down as a compulsory course in our public school system. We're coming along, even if slowly.

The Hartford Courant is regarded as a very conservative organ in the "Land of Steady Habits." So also is the Ansonia Sentinel, which comments in this manner:

The new law requiring spring vehicles to carry lights will not be a very popular one hereabouts. In the first place, owners of such vehicles claim there is no need of such a requirement, except for vehicles equipped with rubber tires. The law already, and for a number of years past, covered that point. A vehicle equipped with steel tires inevitably makes sufficient noise to be heard approaching, even over the smoothest roads. There is little or no danger of them colliding with autos, motor-

cycles or other vehicles travelling at high speed, if the latter carry lamps as they are required to do, it is argued. Collisions between rubber-tired vehicles and those carrying steel tires do not happen as a result of darkness if the rubber-tired vehicles carry lights.

Still another view of the matter is taken by the Meriden Record, as shown by the following:

Such a law is but the natural outcome of the continual innovations in means of locomotion and transportation. It was absolutely necessary that hard and fast rules should be employed regarding lights on motor cars and with their increase the corresponding need of lights on horse-drawn vehicles became apparent. Life in general will be made more safe by the new law, and any opposition to it must result from short-sighted selfishness not capable of realizing the mutual benefit that must accrue.

### IOWA LAW A SUCCESS.

State Treasurer Reports That Over \$700,000 Was Collected During the Year.

"Iowa's automobile tax now amounts to nearly three-quarters of a million dollars a year," the state treasurer's office is quoted as saying, and by that same token it is taken for granted that the law passed in 1911 and amended in 1913 is a success. The total amount received from the registration of motor cars, under its provisions, for the year ending June 30, was \$711,229.07, of which \$520,464.74 was collected since Jan. 1. The number of automobile registrations for the year was over 63,000.

The Iowa law provides a registration fee of \$8 for cars of 20 horsepower and under, and 40 cents a horsepower for larger machines. Eighty-five per cent. of the money so raised is distributed among the various counties as a county motor vehicle road fund. The state highway commission gets eight per cent. and seven per cent. goes to the office of the state treasurer to pay the expenses of handling the money. This means that the motorists of Iowa have contributed \$604,544.71 for road construction during the past year.

### FOR UNIFORM LEGISLATION.

Convention of Officials Interested to Be Held in Montreal, Canada.

In view of the widespread interest in uniform motoring laws, it is anticipated that this subject will be discussed at some length before the an-

nual meeting of the commissioners on uniform state laws, to be held in Montreal, beginning Aug. 26. Every state in the Union is to be represented by three or more commissioners appointed by the governor, and while all phases of uniform legislation will be considered, it is announced that motoring will find a prominent place on the programme.

Charles T. Terry, president of the Uniform Law Commission, with headquarters in New York City, has been working actively for years toward securing greater uniformity in automobile matters. As chairman of the American Automobile Association's legislative committee, he drafted the federal automobile bill, which was introduced into Congress a few years ago. Mr. Terry will represent the commission of which he is the head and will take an active part in bringing the subject of motoring laws before the convention.

### PATENT BILL OPPOSED.

#### Patent Law Association of Chicago Presents Statement to the Senate.

A thorough statement prepared by the Patent Law Association of Chicago has been presented to the Senate at Washington by way of comment upon the Oldfield bill for revision of existing patent laws. Naturally, the statement is somewhat lengthy, covering as it does the many features of the situation. After citing the alleged evils of the present patent system and the suggestions for their removal, the association submits what it believes to be satisfactory arguments against these features of the bill. Particular objection is made against the proposition for compulsory licenses and the elimination of retail price restrictions. Considering the former the statement is in part as follows:

The Oldfield bill provides for compulsory licenses, the avowed object being to prevent the shelving of competitive patents. The theory of the amendment seems to be that an inventor may hold more than one patent relating to the same subject matter so long as he does not contract or agree with others to suppress one or more of his patents. The report justifies this by an argument that the inventor is presumably meritorious and impecunious, and must enlist outside aid to bring his inventions before the public, but assumes that the assignee of a plurality of patents relating to the same industry is attempting to create a monopoly of monopolies and that such ownership is without justification. Of course, the bill ignores a large class of cases where the inventor himself takes out numerous patents relating to the same industry and manufactures under some, but not all, of them. It does not operate against the individual patentee unless and until it has been shown he has agreed with some one else to suppress one of his patented inventions or that he is suppressing a competitive patent acquired by assignment from another.

\* \* \* \*

As to the compulsory license feature of the bill, we do not find from the evidence adduced before the House

committee, nor from any other source of information, sufficient justification for a resort to this scheme, which is wholly antagonistic to the basic principles of the American patent system.

The Oldfield bill, in providing for compulsory licenses, seeks to introduce the idea of a working requirement; but does it by indirection, possibly because of the apprehension that a direct requirement would be unconstitutional.

Regarding price restrictions, the following argument is set up:

If a patentee has a monopoly in the making, using and selling of an article, and has the right to suppress the invention wholly and to exclude others wholly, it follows that he has the right to suppress it in part or to admit others on such terms and conditions as he may fix. Of course, it may be argued that under the constitutional provision it is still within the province of Congress to fix conditions and limitations affecting the exclusive right which the constitution mentions, but the reasoning of all of the decisions up to the present time points to the conclusion that when the constitution used the word "exclusive" it meant just that, and that the constitutional provision could not be avoided by fixing conditions and limitations upon the exclusive right which impaired or lessened its scope. This, of course, does not mean that patent property like other property is not subject to other provisions of the constitution and to the laws of the land, as for example to the police power of the states and the laws relating to the conservation of the public health and the public morals. But the provisions of the Oldfield bill, at their face value, take away from the owners of patented property the right of contract which is enjoyed by owners of unpatented property. We can not see any justification for prohibiting the patentee from fixing in the terms of his contract as one of the conditions of a license the price at which the article shall be resold, if that be necessary to the preservation of his monopoly and if the restriction be imposed as a condition of the license.

### AUTOMOBILE CUSTOMS FIGURES.

#### Interesting Statistics for the Port of New York During the Past Decade.

Statistics prepared by the New York custom house for the period of 10 years ending June 30 last, show that from the port of New York there were exported 40,062 American cars, valued at \$47,069,641. Imports of European cars for the decade numbered 8774, appraised at \$22,507,615. Manufacturers of American machines sent out of New York for foreign use five times as many automobiles as were received from European makers. Unfortunately the bureau of statistics at the New York port has no figures dealing with the number of machines exported during the first three years of the decade, although their valuation is available. One authority at the custom house thinks that perhaps 2000 machines were exported during 1904, 1905 and 1906. This would make the exports for the decade over 42,000 cars.

The official report shows that during the fiscal year ending June 30, 14,383 machines, valued at \$13,122,218, were shipped from the New York port. The statistics for the three preceding years are: 1912, 11,468 machines, valued at \$10,216,162; 1911, 6010 cars, worth \$6,397,307; 1910, 3275 automobiles, valued at \$5,151,428.

## IN THE COMMERCIAL VEHICLE FIELD.

### Some of the Newer Developments Among Motor Driven Farming Implements---Hauling Milk Long Distances by Mechanical Transport--Road Oiling Work.

**B**ECAUSE of the success which has attended the use of tractors on the large farms of the West and Northwest, several designers have been busy in the effort to produce similar equipment adaptable to many different kinds of work in order to take the place of horses and have the same utility on the small farm. This has resulted in the recent announcement of at least three decidedly new developments in the automobile industry.

The Parker motor plow is the invention of Joseph N. Parker of Bedford City, Va., and is the result of experimentation covering a considerable period. The Parker Motor Plow Company of that city has been organized by three brothers, for its production, it being maintained that its practicability has been demonstrated in sod, soft ground, loam and sand.

The chief feature of the invention lies in the method of control, the operator walking behind the plow, or harrow, cultivator, wheel hoe, seeder, etc., as when horses are employed. In addition, fittings are supplied with which it is possible to utilize the motor as a stationary engine.

The whole equipment is light and easily managed. The control mechanism is located on the handle so that it is possible instantly to throw the motor out of engagement, lift the machine over any obstruction and as readily replace it in operation again.

The motor is a two-cylinder, air-cooled, nine horsepower motorcycle type, and is installed midway between the frame side members over the working attachment. Ignition is by Bosch magneto. This engine drives, by shaft and gear reduction, two spiked wheels, and it is claimed that the suction created by the plow holds these driving wheels to the ground and that the spikes prevent them from slipping.

The Holmes Tractor Company, Port Clinton,

O., has brought out the Holmes Little Giant tractor, which is designed for the orchardist, the man with a small farm or anyone who has use for a machine that will do the work of four horses. The motor is a Dice two-cylinder, opposed unit, rated at 12 horsepower. The bore of the cylinders is 5.5 inches and the stroke five. Cooling is by water, the capacity of the system being 40 gallons. Lubrication is by mechanical oiler and splash. Jump spark ignition is employed, utilizing batteries and coil. The Schebler carburetor is supplied from a tank of 25 gallons capacity, and the motor is governed to a predetermined speed.

The planetary type of transmission is used, affording two speeds forward and reverse. The low speed is utilized only for starting and turning in close quarters, it being maintained that the machine can be turned in

a 24-foot circle. The high, or working speed, is rated at from 1.5 to 1.75 miles an hour. Drive is taken from the transmission to a differential gear by a jackshaft, the final drive being by chain.

The frame is of steel channel, braced and hot riveted at the corners and cross members. The rear

end of the frame, which carries the greater portion of the weight, is spring mounted. The front axle is fitted with the automobile type of steering knuckles and is pivoted at the centre to allow for unevenness of the ground without twisting the frame. The front wheels are 36 inches in diameter with five-inch face, and the rear members 78 inches diameter with 10-inch face. The height over all is 54 inches, width six feet and length 11 feet six inches. The weight complete is 4060 pounds.

A machine that is distinctive in appearance, at least, is the Detroit tractor, made by the Detroit Tractor Company, 807 Scotten avenue, Detroit. Perhaps the chief feature is the method of control, this being by means of reins, three of which

Parker Motor Plow Utilizes Twin-Cylinder Motorcycle Engine.

**Holmes Little Giant Tractor in Orchard Work.**

are held to be all that is necessary, although a fourth is added to operate the brake when the tractor is to be used in hilly countries. Steering is accomplished by a pull on either the right or left steering rein, which connects the engine by a special friction clutch to the steering gear. A very slight pull is said to be all that is required to make a complete turn. A pull on both steering reins simultaneously releases the main clutch in the engine flywheel, thus stopping the tractor. The third rein is used only to shift the gears from neutral to forward or back.

The main frame carrying the engine and gears is a semi-steel casting. The engine is made especially for this company by the Continental Motor Manufacturing Company of Detroit. It is a four-cylinder, four-cycle, water-cooled unit of the L head type, with bore of 4.125 inches and stroke of 5.25, giving it a rating of 27.25 horsepower under the S. A. E. formula. Lubrication is by a positive plunger pump system with constant oil level, all enclosed within the crankcase. Cooling is aided by a radiator of special design, of the vertical fin tube type. Ignition is by Bosch high-tension magneto. The carburetor is designed to vaporize gasoline, kerosene, distillate and low grade fuel oils, although gasoline is used for starting. The capacity of the fuel tank is 30 gallons.

The clutch is a 16-inch leather faced cone, and power is transmitted through direct gears, two spur gear reductions being all that are required between the crankshaft and the driving wheels. A separate oiling system is utilized for the bearings and gears, when the tractor is in motion. The main axle is

solid, of 2.5-inch cold rolled steel, and the driving wheels are made with wide, flat grouters, which are held not to injure the finest road surface. For field work, detachable cones are furnished, which give the wheels the proper tractive power in soft ground. Extension rims are supplied when desired. The speed of the tractor is given as from 2.5 to four miles an hour.

### NEW TAXICAB REGULATIONS.

#### Enforcement of Ordinance Delayed at Last Moment by Injunctions.

Aug. 1 had been set by the board of aldermen in New York City as the date upon which the new ordinance affecting taxicabs was to go into effect. But at the last moment, 10 temporary injunctions were secured, restraining the police department from enforcing its provisions. As a result of this movement, but 30 of the 2800 taxicabs were operating under new licenses Aug. 1.

The ordinance in question seeks to abolish the private taxicab and hack stands at hotels and other buildings, and to reduce fares very materially. Those who secured temporary injunctions were: The Yellow Taxicab Company, operating over 600 taxicabs; Mason & Seaman Company, 600; Haverty's Cab Company, 50; Universal Taximeter Company, 50, and the New Taxicab & Auto Company, 40. The list does not include the Independent Taxicab Owners' Association, representing some 500 individual cab owners.

In addition to the other provisions, the ordinance requires taxicabs to be licensed, after the meters have been inspected and found satisfactory. Taxicabs also are required to display a rate sheet containing the new list of fares, and the meter must be so regulated as to show the exact fares under this rate sheet. The five companies which sought relief in court maintain that the new rates are confiscatory and they raise ob-

**Detroit Tractor, Steered by Reins, Attached to Farm Wagon for Road Use.**

jection to the section abolishing the private hack stands. In this latter matter they have the cooperation of the Hotel Men's Association, but not of the Independent Taxicab Owners' Association.

### PEERLESS IN ROAD OILING WORK.

#### Problem of Hauling Heated Material Long Distances Is Solved Effectually.

The problem of applying oil to the road surface at a distance of 20 miles or more from the starting point and to spread the material at a heat of 200 degrees or over, is one which has been solved effectually by the road commissioners of Los Angeles county, California, by the use of a Peerless five-ton truck, made by the Peerless Motor Car Company, Cleveland, O. As will be

Peerless Five-Ton Chassis Equipped with Special Body for Handling Heated Road Oil.

noted by the accompanying illustration, the body has been especially designed for the purpose.

The chassis is fitted with a 1000-gallon oil tank, and the latter is covered with a coating of asbestos two inches thick. Oil is run into the tank at a temperature of 350 degrees, Fahrenheit, and, thanks to the heat-retaining quality of the asbestos protection and the speed at which the truck may be driven, it is possible to cover as many as 35 to 40 miles before the oil is too cold for use.

Air pressure of 60 pounds to the square inch is maintained inside the tank by an air compressor operated by the same mechanism as that used to actuate the dumping body for sand and gravel utilized with Peerless trucks. Heat from the motor exhaust is utilized to keep the oil spreader warm so that the material will not thicken and clog up at that point.

### HAULING MILK BY TRUCK.

#### Springfield Dealer Saves Between \$8 and \$9 a Day, and Improves Service.

An interesting example of the economy and efficiency that can be experienced through the use of the mechanical transport in the milk business is that reported by Charles A. Nash, Springfield, Mass. Five years ago he was able to supply his customers among the families of Springfield with bottled milk by three one-horse teams. Today, seven such wagons distribute 3300 quarts of milk and 125 quarts of cream daily.

Practically all of Mr. Nash's supply comes from Gilbertville and Old Furnace, in Worcester county, the former being approximately 33 miles from his plant on Oakland street in Springfield.

Before the purchase of the Alco five-ton truck, this milk was collected from the two stations named and brought to Springfield by train. Its arrival at the freight house depended upon the arrival of the train and the amount of freight it was able to pick up on the road. A contractor was employed to bring it from the freight house to the bottling plant.

Now, one man leaves the Oakland street plant with a truck load of empty cans every morning at 4:30, Sundays included. He drives directly to Gilbertville, where he finds the farmers awaiting his arrival. The wait at this point averages about 20 minutes. Then follows a drive of 4.5 miles to Old Furnace, where the same plan is followed, necessitating a wait of about 15 minutes. The 28.5 miles between Old Furnace and Springfield is covered before 1 or 1:30.

The old plan of bringing the milk to Springfield by train and conveying it to the Oakland street plant by contractor occasioned an average daily expense of \$21, this including a freight charge of five cents a can each way. Mr. Nash says that the daily expense of the truck, including the wages of the driver, averages between \$12 and \$13.

### USED MOTZ CUSHION TIRES.

#### That Is the Reason C. W. Crawford Had No Punctures on Transcontinental Trip.

C. W. Crawford of Los Angeles, Cal., recently arrived in New York City after having completed a transcontinental tour without a single puncture. Mr. Crawford drove a five-passenger gasoline car equipped with Motz cushion tires, made by the Motz Tire & Rubber Company, Akron, O. The trip occupied practically 20 days of actual driving.

The route selected lay through the mountains of the southwest, and for some distance in Mexico. For 1500 miles, from Pamo, Cal., to Santa Fe., N. M., almost impassable roads were encountered. In fact, in some places there were no roads at all, in the generally accepted use of the term.

In order to follow the mapped course it was nothing unusual to cross rivers by the way of railroad trestles. Quite often streams or shallow rivers were forded. Several times it became necessary to extricate the machines from sand hub deep, and often the services of a team of mules were required. Small boulders and sharp stones afforded plenty of opportunity to demonstrate the value of the Motz cushion tires, and Mr. Crawford is emphatic in the opinion that they are great time savers, when compared with the use of pneumatics under such circumstances and conditions.

### SHOW DATES SELECTED.

#### Automobile Chamber of Commerce Decides on New York and Chicago Events.

Announcement is made that the national automobile show in New York City will be held in the Grand Central Palace, Jan. 3-10, and that in Chicago in the Coliseum, Annex and First Regiment armory, Jan. 24-31. Both events will be held under the auspices of the Automobile Chamber of Commerce, of which S. A. Miles is general manager. This will be the first time that the New York and Chicago displays have been held under the same management since the so-called Selden patent litigation divided the indus-

try in 1905. Both shows will be for pleasure cars only.

Four floors of the Grand Central Palace will be utilized for the New York exhibition. Automobiles will be shown on the first and second floors, and in the wall spaces on the other two floors. Members of the Motor & Accessories Manufacturers will have their first choice of the accessory booths on the third floor, while accessory makers and jobbers not members of that organization will be permitted to make display in connection with the motorcycle section on the top floor. The total available show space in the building is estimated at 50,000 square feet.

The plans for the Chicago display call for increasing the exhibition space in the Coliseum, by extending the gallery at the sides and ends, adding 5000 square feet. The greater portion of the

C. W. Crawford and the Motz-Equipped Gasoline Car with Which He Crossed the Continent from Los Angeles to New York.

main floor of the armory will be devoted to the exhibition of electric vehicles, as was the case last season.

George B. Sickly, a rural free mail carrier in the Devil's Lake country in Michigan, starts and stops his Buick car 125 times in every 25 miles, every day in the week except Sunday. His speedometer shows 4000 miles, which means a total of 20,000 stops. He kept account of his gasoline for 900 miles and found he used 50 gallons, or an average of 18 miles to the gallon. He reports that the repeated gear shifting has not resulted in any more wear and tear on tires or machinery than in ordinary driving.

Collections of motor car taxes for the first half of the year in Alabama show an increase of \$10,000 over the same period last year.

## COLE STANDARDIZES SERIES NINE MODELS.

**S**IMPLIFICATION and standardization are features of the Series Nine announced by the Cole Motor Car Company, Indianapolis, Ind., maker of the Cole cars. This is particularly true of the power plant, the twin cast cylinders of both the four and six-cylinder models having a 4.25-inch bore and 5.25-inch stroke. The former models, the Series Eight, comprise two similar designs, a 40 four-cylinder and a 60 six-cylinder having a bore and stroke of 4.125 by 4.75 inches, respectively, and in addition a 50 four-cylinder with a bore of 4.5 inches and stroke of 5.25. An increase is noticeable in the horsepower of the two new chassis, especially the larger, which is said to develop 68. The adoption of a standard power plant is in keeping with the policy of the

the small end is fitted with a one-inch diameter phosphor bronze bushing. The split white bronze bushing at the large end is 2.125 inches in diameter. Both bearing surfaces are 2.25 inches long.

The camshaft of the four-cylinder motor is driven by helical gears, but a silent chain is utilized on the six, it being pointed out that a chain can be used to advantage and that a practically uniform torque is provided. Tungsten steel valves are employed, these being located on the left side of the motor and actuated by the roller type of adjustable pushrods, operating in cast iron guides pressed into the cylinder casting. The valve mechanism is enclosed by quick detachable plates. The practise of providing an in-

**Members of the New Cole Family or Series Nine: A, Six-Cylinder Roadster; B, Same Chassis Fitted with Seven-Passenger Touring Body; C, Four-Passenger, Four-Cylinder Touring; D, Four-Cylinder Roadster—The Cylinder Dimensions Are Identical and Standardization of Parts and Dimensions Are Noticeable.**

company, and is of distinct value to the purchaser.

The unit power plant and three point principle of suspension is continued, the front end being supported on a trunnion and the other two points being arms cast integral with the flywheel housing. The bracket carrying the Delco motor-generator is also cast integral with the crankcase and is located on the right hand side. The crankshaft is a drop forging of a high-grade alloy steel, heat treated and accurately finished by grinding all bearings to very close limits. Three bearings are utilized on the four-cylinder motor and four on the six, these being die castings of white bronze and having shims for making easy and accurate adjustments. The connecting rods are also drop forged from a special alloy steel, and

specification plate and marking the flywheel for checking valve timing is continued.

Carburetion is by a Stromberg, located in an accessible position on the left hand side of the motor. A pressure fuel feed is employed, a small adjustable air pump being fitted to the left hand side of the power plant and actuated by an eccentric on the camshaft. The gasoline tank is suspended at the rear of the chassis and has a capacity of 22 gallons. The method of suspension is indicated in an accompanying illustration. The intake manifold is well designed, and that on the six-cylinder model has a water jacket to eliminate condensation of the mixture, as well as to assist in the vaporization of low-grade fuel.

The constant level splash and pump circulation of lubricant is continued, its efficiency and

**Motor of the Cole Four-Cylinder Model, Showing Location of Motor-Generator and Three Point Suspension.**

economy with absence of smoking having been demonstrated in service to the complete satisfaction of the company. The adjustable pump is actuated by a spiral gear on the camshaft, drawing oil from the reservoir, forcing it through a sight feed on the instrument board, thence to the main bearings. Each connecting rod dips into an individual trough cast with the crankcase, and baffle plates prevent other than the desired constant level of the lubricant. All surplus oil is collected and led to the sump to be circulated again. The capacity of the smaller motor is nine quarts, that of the six-cylinder, 12. The construction and operation of the plunger pump was fully described and illustrated in a recent issue of *The Automobile Journal*. Ignition is by the Delco timer device, which has a governor for automatically advancing and retarding the spark in proportion to motor speed, and the conventional control is also provided.

The clutch is of the leather faced cone type, with six separate tension springs concentric with the clutch centre. The aluminum cone is 14.875 inches in diameter and 2.5 inches wide, with a 11-degree face angle. Gradual yet positive engagement, as well as easy release, are features emphasized with the construction. The clutch hub bearing is of the annual ball type and a ball thrust bearing is incorporated in the release mechanism. The clutch springs are mounted on a six point spider supported from the rear extension of the crankshaft, located between the fly-wheel and clutch proper. A leather brake or clutch stop is incorporated to prevent spinning when changing gears.

The selective type of transmission provides the conventional three speeds forward and reverse. The shafts and gears are made of chrome nickel steel and are mounted on annular bearings. A roller bearing is employed where the sliding gear shaft floats in the clutch shaft extension. The speed ratios obtained by the transmission

are: High, 1:1; intermediate, 2:1; low, 3.65:1; reverse, 4.76:1. The axle ratio is 4:1 on both models.

Drive is by shaft, that of the four-cylinder model being 1.25 inches in diameter, and that of the six 1.375. A Spicer universal joint is employed at each end of the shaft. The rear axle is of the full floating type, a Timken, having a nickel steel housing and employing the tapered roller bearings throughout. The design gives the cross section at any point greatest carrying capacity and resistance to driving and road stresses. The drive axles, differential and gears may be displaced readily without removing the wheels, the differential being readily accessible through an ample-sized inspection plate.

The front axle is a Timken of the I beam section type, and its dimensions provide a large factor of safety. It is of a high-grade steel, having two heat treatments, and chrome nickel steel heat treated spindles, arms and knuckles. The spindles are 1.5 inches in diameter. The same size axle is used on both chassis. Adjustable wheel stops are utilized to provide the proper steering angle and to prevent chafing of the tires by contact with the frame. The springs are semi-elliptic in front and three-quarter elliptic in the rear. The front members of the four-cylinder are 37.25 inches long and two wide, and those on the six are 41 inches long. The rear springs are 50.25 inches long on the four and 52.25 on the six.

Continuing its practise of the past, the Cole Motor Car Company fits large-sized brakes. The

**Rear View of the Cole Six Chassis, Showing Sturdy Rear Axle, Fuel Tank and Adjustable Tire Carriers.**

**Driveshaft Speedometer Connection.**

easily adjusted and lined with Autobestine, an asbestos fabric.

Among the changes noted is the placing of the driver at the left with centre control. The Gemmer steering gear of the worm and full gear type is continued, and an 18-inch corrugated wheel is utilized on both models. Provision is made for proper lubrication and adjustment. The frame is unusually strong.

A Mayo cellular radiator is used, as in former practise, and cooling is assisted by a three-bladed aluminum fan driven by a flat belt from a pulley on the pump shaft. Provision is made for regulating the tension of the drive. The centrifugal water pump is located midway of the motor on the right hand side. Large intake and exhaust water manifolds are still employed there, insuring the proper temperature of the fluid under all conditions of service. The wheelbase of the four-cylinder model is 120 inches, that of the six 137, with option of 56 or 60-inch tread.

Firestone quick detachable, quick demountable rims are standard equipment, and provision is made at the rear of the chassis for carrying two spare shoes. The tire sizes are as follows: Four-cylinder, 34 by 4.5 inches; six-cylinder, 36 by 4.5.

**Cole Power Tire Pump.**

two sets operate on the drums of the rear wheels, which are 1.55 inches in diameter and have a 2.5-inch face. The service member is actuated by pedal and the emergency by lever. Both sets are equalized,

with teeth on the periphery of the enclosed flywheel, the operation being effected by pressure on a small pedal located on the footboard. It is necessary before pressing the pedal to touch a button on the instrument board. All wires are carried in brass conduits, which is claimed to prevent possible short circuits, etc. The ignition equipment of the system is located on the left hand side of the power plant near the front and is driven by spiral gears from the camshaft. One of the features of the new Delco system is the utilization of a circuit breaker in place of fuses. The starting, lighting and ignition switch is a unit and is fitted with a Yale lock. Included in the system is an electric horn, which is operated by a button on the centre of the spark lever on the steering column.

An interesting unit in the equipment is the power tire pump shown in an accompanying illustration. It is mounted on a bracket on the right

**Unit Power Plant of New Cole Series, Having Centre Control, Power Tire Pump and Standardized Features.**

side of the motor and is driven by gears actuated by the fan belt. The gear driving the pump proper is controlled by a lever conveniently operated. It is a Taylor Nail pump, which was fully described and illustrated recently in these columns.

Another innovation is the method of driving the speedometer. The gearing is attached to the forward universal joint housing, where it is fully protected from dust, etc., a design making for a quiet drive and a more flexible connection than heretofore. The cowl board carries the ignition and lighting switches, oil sight feed, air gauge, air pump speedometer and clock and these control units are within easy reach of the driver. Both clutch and brake pedals are adjustable.

Roomy streamline bodies are fitted, the four-cylinder model being available with two, four and five-passenger types, while the six is provided in three types, seating two, six and seven passengers. The upholstery is deep and lux-

urious, long grain hand-buffed leather being utilized over deep, flexible springs and genuine curled hair. The front and rear doors on the four and five-passenger four-cylinder models are extremely wide, being 24 inches, while on the six and seven-passenger, six-cylinder types these are 24 inches in front and 26 in the rear. The auxiliary seats of these models are operated easily without disturbing the occupants of the tonneau, may be folded in compact form, and are so located that exit and entrance is not affected.

The running boards are exceptionally clean. The battery box is suspended under the front floorboard and is very accessible. The equipment is complete, including a cloth lined pantasote top fitted with Collins curtains, which fold into the top. A trouble lamp, also a light for the tonneau is included in the lighting equipment. A complete outfit of tools is carried in a drawer under the front seat. The windshield is of the rain vision type, securely mounted, and is practically a part of the body.

### THE LINCOLN HIGHWAY.

#### Vice President Fisher Hopes Portions May Be Completed by 1915.

Vice President Carl G. Fisher of the Lincoln Highway Association, when interviewed recently, emphasized the many benefits to be derived by a community through being located on the proposed Lincoln memorial transcontinental highway. He said that it was evident that the selection of the final route could only be governed by three or four factors. Those most vital were: The directness of the route from New York to San Francisco; the points of scenic beauty and historic interest which could be reached advantageously without too many or long detours, and the character and amount of support offered to the association by the local communities which would be direct beneficiaries of the highway.

Mr. Fisher noted that some sections of the Middle West had taken it for granted that the Midland trail had already been designated officially, as a portion of the route. He stated that in view of the fact that President Joy of the association went through Cheyenne to Salt Lake City on his recent trip across the continent, the Indianapolis tourists had determined to go to the Pacific Coast through Denver and over the Midland trail to Salt Lake City, in order that a detailed report of the conditions in this section might be secured.

He further expressed the thought that if quick action and hearty response followed the appeals of the association, inside of a year, the entire fund could be completed and that many stretches of the proposed highway could be built before the opening of the Panama-Pacific exposition in San Francisco in 1915.

### DETROIT ELECTRIC'S TRIP.

#### Washington to Baltimore and Return on One Charge of the Battery.

An interesting demonstration of the ability of an owner of a Detroit electric car, made by the Anderson Electric Car Company, Detroit, to make a moderate tour resulted from a trip between Washington and Baltimore and return, in which two Washington men recently took part. The distance between the two cities, over the

Detroit Electric on Recent Washington-Baltimore Trip.

route selected, is 41 miles, and therefore the entire distance covered was something like 82 miles. The car left Washington at 7:40 in the morning, and four hours later was in the down-town district of Baltimore. The return trip occupied an hour longer, detours being necessary on account of road repairs.

Part of the state highway had just been heavily oiled, and this materially checked the speed of the machine. At another point, heavy sand was encountered, but the electric experienced little difficulty in extricating itself. Upon the return to Washington, the entire trip having been made on one charge of the battery, the car was found to be in excellent condition, with sufficient current remaining to travel a number of miles further. This car already has been driven 6213 miles with the same equipment.

## THE REPAIR SHOP AND THE GARAGE.

### Suggestion for Constructing a Light Stand Operated from Either End of the Work Bench—Rack for Retaining Valves in Proper Order.

ONE of the chief requisites of the repair shop is a well-lighted work bench. The majority of installations provide a drop light, and

Working Plan of Adjustable Light for Work Bench: A, Showing How Light May Be Moved as Desired; B, Supporting Arm; C, Pulley; D, Lamp; E, Cable Carrier.

if the bench is very long, two or more of the lamps may be fitted. The disadvantage of a fixed light is that the workman is often obliged to move the work under the lamp, and when he wishes a tool at the other end of the bench must swing the light in the direction of the object sought.

In an accompanying illustration is shown a method of constructing a light rack over the bench, the sketch at A depicting the operation of the light, and it will readily be seen that it is possible for the workman to be at the extreme right of the bench and roll the lamp to him by means of the cable located under the bench, as shown in the drawing. Some benches would not be adaptable to its use.

The rack is easily constructed and the material required is not expensive. It consists of small gas piping, two standards and a like number of elbows. This material could be replaced by round iron, drilling and threading the parts to fit plates which are secured to the ceiling or to the wall, according to the location of the work bench.

A supporting arm is shown at B, while the pulley member is illustrated at C. The latter is provided with a hook for attaching the lamp cord and has an extension on the opposite side to retain the pulley on the rod. It is not necessary to fit the cable carrier shown at E, as the light could be moved by hand as desired. The cable was fitted in the installation noted by the writer, and the inventor of the plan states that it was extremely handy when he wished the use of the lamp at the other end of the bench. In addition

to making for convenience, the device makes for economy, as one light may be utilized in place of two or more.

#### VALVE RACK.

The complete, and sometimes the partial, overhaul of the power plant includes the removal of the valves, and when these members must be laid aside for any length of time, they are apt to become mixed if the work is intrusted to a green helper. The usual practise is to leave them in the cylinders, but this has its disadvantages in that care must be exercised in handling the units.

In an accompanying illustration is presented a suggestion for a valve rack which can be constructed of wood and may be made a permanent fixture on the work bench or a portable unit as desired. All that is required is to drill 12 holes to take the valve stems and the openings are marked from 1 to 6. For T head motors the upper row of holes could be utilized for the exhaust valves and the lower for the intakes. The rack also is adaptable for four-cylinder motors of the L head type, as well as other constructions.

Harry W. Wood, district representative of Enoch Morgan's Sons, with Cleveland, O., as headquarters, says that any travelling salesman who covers the grocery trade can increase his scope fourfold by using an automobile. Mr. Wood makes this statement as the result of his own experience in covering Ohio, Indiana, Michigan and Illinois in a Studebaker car, made by the Studebaker Corporation, Detroit.

Suggestion for a Valve Rack to Simplify the Work of Replacement in the Overhaul of the Motor.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**T**HE ideal tire pump is the power driven member, but many small garages are not equipped with electricity, and the business does

Fig. 1—Globe Tire Pump.

not warrant the installation of such systems. The Globe Manufacturing Company, Battle Creek, Mich, is producing what is termed the Globe Dead Easy tire pump, which is not only moderately priced, but is stated to inflate a 34 by four-inch tire to 75 pounds pressure in 90 seconds and with very little exertion.

The pump, which is shown at Fig. 1, is five by 8.5 by nine inches,

with the handle in two sections 16 inches long. It is designed for a permanent fixture or for carrying in the car, and when used in the garage may be clamped to a suitable portable base. The equipment includes 12 feet of hose, Globe self-retaining acorn nipple, which holds the tire valve open, and a registering pressure gauge. It is finished in nickel and black enamel.

A sectional view of the pump is shown at Fig. 2, and it will be noted that there are two pairs of cylinders, the smaller being placed above the larger, which are 3.5 in diameter. These are secured to a base. Each pair of cylinders has a two-stage piston and are connected by means of links to a pivoted rocker arm, to which is attached the operating lever or handle.

When the lever is moved to the right, as shown by the dotted lines, the right hand piston moves downward, the left hand member travelling in an opposite direction, forcing the air from the large cylinder through a connecting tube into the opposite small cylinder and producing the first stage of compression, which, it is stated, does not exceed 40 pounds to the square inch. On the reverse movement of the lever, the left hand piston moves downward, while the right travels upward, forcing the air out of the small cylinder

and producing the final stage of compression.

It is claimed that the link and rocker arm construction, and toggle action, results in each piston travelling rapidly at the beginning of its stroke, and when the load or resistance is very light. As the stroke advances and the load increases, it is stated that the travel is slower. It is pointed out by the maker that when the stroke is finished and when the load is the greatest, the three pivoting points, A, B, C, or A, D, E, are brought into a straight line, producing considerable leverage at the time it is most needed.

### LIGHTNING REPAIR KIT.

Fine threads utilized in motor cars make close and accurate fits imperative, else the efficiency of the part is greatly impaired. The Wiley & Russell Manufacturing Company, Greenfield, Mass., maker of screw-cutting tools, is marketing the Lightning auto repair kit shown at Fig. 3, which is designed for model T Ford, Maxwell, Metz and all medium-priced cars.

The screw-cutting assortment is very complete and was designed with special reference to the screw threads found on the machines above mentioned. It comprises 16 taps, 16 dies, two stock and two tap wrenches, permitting of the cutting of threads from 18 to 32 an inch, also pipe threads; in fact, the equipment is adapted to a large variety of work and different makes of cars, etc.

The assortment comes in a genuine goat skin leather case, having compartments to protect the

cutting edges of the tools, and the container is not only compact but very durable. The same high-grade material and workmanship for which the product of the Wiley & Russell Manufacturing Company is not-

Fig. 2—Sectional View of Globe Tire Pump Showing Stages of Compression.

Fig. 3—Willey & Russell Lighting Auto Repair Kit Containing Complete Assortment of Screw Cutting Taps, Dies, Etc.

ed are incorporated. The company has a very interesting proposition for the trade.

### NEW BEARD AUTO JACK.

The Beard Auto Lift Company, Pleasant Lake, Ind., has brought out a new jack. The frame member is made by forming a piece of channel steel with the flange edges toward each other, and is held together near the top by a flat cross piece. Between the two upright pieces is a perforated standard, permitting of varying adjustments. This part is constructed of a piece of flat steel turned over at the top, making a standard of double thickness. On top is a swivel support. The hand or foot lever is also made double, and when it is clear down the upper part is in line with the fulcrum. All parts stand in a perpendicular position, and all load is carried on the two fulcrums on either side of the main support, which sets directly on the base of the jack. For repair work the jack is fitted with a pin adjustment.

### WINSOR VALVE REMOVER.

The Winsor Manufacturing Company, 55 Eddy street, Providence, R. I., is marketing a patented adjustable valve remover which presents interesting as well as practical features, in that it is adapted to any type of engine. As will be noted by the accompanying illustration at Fig. 4, it is comprised of a barrel A, levers B and C, and a chain. The barrel member carries a threaded spindle which may be raised or lowered as desired. This is inserted through the spark plug opening and adjusted to hold the valve firmly on

its seat. It should be explained that the barrel member rotates freely on the spindle, permitting of operation on motors of varying construction. The method of compressing the valve spring is shown in the illustration, the end of the chain being attached to the lever B and the other end to the lever C. Both of these parts provide means for varying the location of the chain. To displace exhaust valves, the intake cap is utilized. The remover is made to fit all spark plug openings and extra barrels are not expensive. It comes nickel plated and with an enamel black finish. As will be noted, the length of the lever C provides for considerable leverage.

### OIL PACKING PISTON RING.

The Automobile & Accessories Manufacturing Company, Baltimore, Md., is marketing a new type of piston ring, which is claimed to reduce friction, insure perfect lubrication and to fit itself to the cylinder walls. It has three V shaped grooves cut around its face, making the bearing just one-half of the ordinary .25-inch ring. It is claimed that because of the ribs the ring will wear to a fit very quickly, and that after seating the wear will be very gradual. The grooves act as a lubricant retainer, insuring lubrication as well as preventing loss of compression. It is also stated that the construction reduces friction.

On two small order blanks, Purchasing Agent C. J. Reynolds of the Studebaker Corporation, Detroit, recently let the contract for 16,000,000 pieces of material for use in building the first run of Studebaker cars in the fiscal year that opens Sept. 1. The order represented cotter pins and nuts sufficient to last until about Jan. 1.

Fig. 4—Winsor Adjustable Valve Remover Adaptable to Any Type of Motor.

## FROM INDIANA TO THE PACIFIC COAST.

**T**HE following brief story of the recent Indiana-Pacific tour of the Indiana Automobile Manufacturers' Association, written by Elwood Haynes, president of the Haynes Automobile Company, will prove of interest, as indicating the character of roads over which the tourists made their memorable trip from Indianapolis to San Francisco and Los Angeles:

The tour had two objects in view. First and foremost, we wished to interest the public in the scheme for building a highway across the continent. This scheme originated in the mind of Carl Fisher of Indianapolis, and who immediately set to work to put it into execution by inviting the Indiana manufacturers to join together in a tour to the Pacific Coast.

The roads of Illinois were in much better condition than expected; while not all that could be desired were particularly good just at the time we traversed them. We were cordially greeted in St. Louis, which was our first stopping point in the state of Missouri. The roads of that state were fairly good and the people had taken the pains to improve them in many places for our particular benefit. The weather conditions in Kansas were most excellent, and it is reported that 300 miles of highway were made ready for our especial benefit. Certain it is that we made good time throughout the length of this great state.

From Denver onward our journey became more interesting because we were entering the vast Rocky Mountain system, which is not only new to Hoosiers but inspiring to all tourists. Those of us who had been through these mountains before by rail soon realized that going through them in an automobile was an entirely different matter. As the road wound in about these majestic peaks and one after another of the snow crowned summits came into view, we were impressed with the fact that the automobile affords the best means of really viewing these natural wonders that has ever yet been produced. It was with some trepidation that we rolled along on the narrow shelves called roads, from which we could look up at the rocky wall above us and downward thousands of feet into a chasm below. We realized that coolness and precision in the driving of the cars were the sole guarantees of our safety.

Roads of this character were so numerous, however, that we soon became accustomed to the sensation and began to enjoy the beauties which were constantly unfolding to view. Far away we could see some giant peak, its distant snow capped summit glittering in the sunlight, while all around us were mountains of lesser height varying in appearance from solid rock to green clad verdure. It was at the summit of the Rockies at the height of about 11,000 feet that we found a snow bank, near which beautiful scarlet flowers were growing, so that we were able to gather a bunch of flowers near a snow bank. Not far from this point we were able to look down over a nearly sheer precipice upon the terminus of the Moffit road nearly 800 feet beneath.

Soon after leaving the Rockies we entered the Sierras, which, while perhaps not so grand as the Rockies, presented scenes of beauty peculiar to themselves and quite different from anything we had seen before. Between the Rockies and the Sierras were vast stretches of desert land in the states of Utah and Nevada. Through some of this desert the roads were exceedingly bad, while on others they were as smooth as boulevards and we could readily make speeds of from 30 to 35 miles an hour without the slightest shock or jar.

We finally arrived at Carson City, Nev., which is located near the celebrated blue Lake Tahoe. This beautiful lake deserves much more than a passing notice, since there is said to be nothing like it in all the world. The water while not pure has the appearance of liquid sapphire, so intense and brilliant is its color. We were welcomed and given free entertainment at the tavern of Tahoe, located on its shore.

The performance of Indiana machines was highly

creditable, and I feel compelled to say in all sincerity that Indiana has established a great prestige in the minds of the people along this road regarding the character of her products.

I was personally very much pleased with the performance of the Haynes cars. A careful examination failed to show any defects in either the four or six-cylinder machine. Almost no time was spent on cars en route, and the appearance at the completion of the journey, which ended at Los Angeles, was more like that of new cars than of machines that had crossed the continent.

With the Haynes Team in Colorado: 1, The "Lucky Thirteen", Between Colorado Springs and Denver; 2, the Two Cars at Junction City; 3, No. 12, Near Denver.

## IN THE REALM OF THE MOTORCYCLIST.

### Limits of New F. A. M. Districts Defined--Pirate Single and the Master Machine Latest Additions to the List--News of the Industry in General.

THE 1913 assembly of the Federation of American Motorcyclists, at Denver, Col., decided to return to the district form of government and the United States was divided into eight districts, which have been defined as follows: New England, Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut; Atlantic, New York, New Jersey, Pennsylvania and Delaware; South, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Tennessee, Kentucky, Mississippi, Cuba, Porto Rico and Panama; Lake, Ohio, Indiana, Illinois, Michigan and Wisconsin; North Central, Minnesota, North Dakota, South Dakota, Nebraska, Iowa and Missouri; South Central, Colorado,

cycle engine. Full information concerning the Federation of American Motorcyclists is included, as well as all the recognized world's records, and a particularly valuable feature is the list of machines and the grade of Mobiloil best adapted for their use on each. As already stated, the booklet is free to those who make request.

#### The New Pirate Single.

The Milwaukee Motorcycle Company, Milwaukee, Wis., which was organized about the time of the Chicago motorcycle show last winter, is announcing a new 5-6 horsepower single-cylinder machine, which is to be known as the Pirate. The mount is shown in an accompanying illustration, and it is understood that it is to be followed in the near future by a twin, containing many of the same features.

The motor is said to possess a new system of valves that give it increased power. The bore is 3.3125 inches and the stroke four, the unit being termed by the maker a long stroke type. The frame is held to be of modern design, incorporating a fuel tank of three gallons capacity and a one-gallon oil tank. A free engine multiple disc clutch and multiple disc rear hub are among the other features noted. Control is by Bowden wire, concealed in the handlebars. The floating seat-

The New Pirate Single, Made by Milwaukee Motorcycle Company.

Kansas, New Mexico, Oklahoma, Arkansas, Louisiana and Texas; North Pacific, Montana, Wyoming, Idaho, Washington, Oregon and Alaska; South Pacific, Utah, Arizona, Nevada, California, Guam and Philippine Islands.

#### Gargoyle Mobiloil Booklet.

The Vacuum Oil Company, Rochester, N. Y., is distributing among riders who make application therefor an interesting booklet containing information about motorcycles and their lubrication. It is maintained that Gargoyle Mobiloils, which have been made by this company ever since motorcycles were first used, are recognized as a standard brand for their correct lubrication.

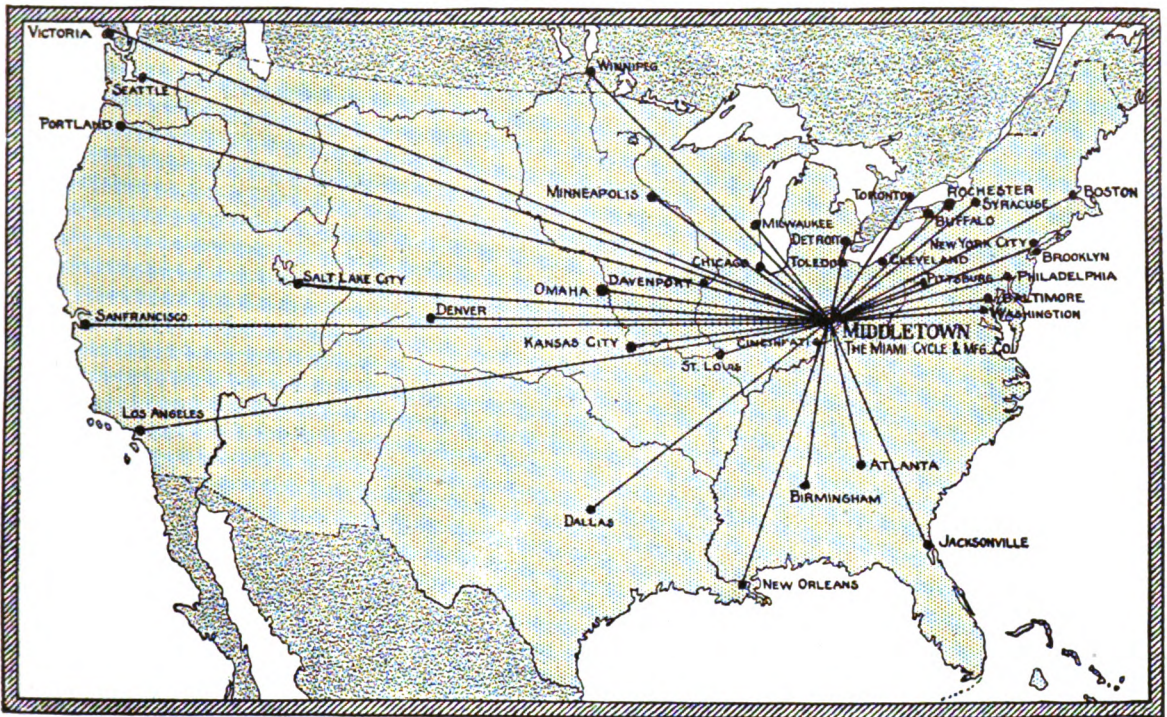

The booklet contains a description of these oils and explains their application to the motor-

post, a special patented design, is expected to make riding the Pirate a real pleasure.

#### Enter the Master Machine.

A company has been formed at Harrisburg, Penn., for the purpose of manufacturing a motorcycle to be known as the Master Machine, the invention of Charles W. Gerhart of Mt. Holly Springs, Penn. The officers of the company are: President, C. W. Gerhart; vice president, Dr. George M. Diffenderfer, Carlisle, Penn.; secretary and treasurer, J. F. Rohrer. Work will be begun at once on a new factory to be located adjacent to the tracks of the Reading railroad at Paxtang, a suburb of Harrisburg. The inventor of the new machine claims many features for his motorcycle not found in other makes.

**THE CENTER OF MOTORCYCLE ACTIVITY  
IN THE UNITED STATES  
is Middletown, Ohio, the home of**

**THE FLYING MERKEL**

The keynote of our 1914 selling campaign will be SERVICE—Service for the dealer, and Service for the rider. With distributing points in all of the principal cities, and dealers in practically every county in the entire United States, Flying Merkel riders can be assured of prompt and satisfactory service at all times.

With our new factory at Indianapolis, and with another \$25,000 addition being built to our plant in Middletown, Ohio, we will be in position to give dealers throughout the country prompt and satisfactory handling of their orders at all times.

After a most careful analysis we predict that the season of 1914 will in every way prove the greatest motorcycle season in the history of the industry, and it therefore is important for dealers to place their specifications early, and for riders to order early from their dealers. We are ready to sign for 1914 now.

Next season as was the case this year, the popular slogan will be, "If it passes you, it's a Flying Merkel."

N. C.; Bond Bros., 212 Walnut street, Muscatine, Ia.

Louis J. Tetley, 4 Mechanic street, Red Bank, N. J., and J. F. Tucker, Pennville, Ind., have been appointed county commissioners by the state commissioners of their respective states. The former is for Monmouth county and the latter for Jay county.

The membership of the F. A. M. was increased during the month of July by 519, divided according to states as follows: New York, 65; Ohio, 56; Indiana, 49; Massachusetts, 48; Illinois, 43; Kansas, 36; Oregon, 35; Colorado, 21; Connecticut, 20; Nebraska, 14; Texas, 14; California, 13; Pennsylvania, 12; New Jersey, 11; Montana, nine; South Dakota, eight; Michigan, seven; Oklahoma, seven; Wisconsin, seven; Maryland, six; District of Columbia, six; South Carolina, four;

thanks of the association for his valuable services and was rewarded by being elected unanimously to the position of general manager of the association, with complete direction of the motorcycle shows. His compensation will be the surplus from the exhibitions. He reported that the applications for space at the Chicago display already exceed the entire exhibit of last season, and he was directed to take up negotiations with Samuel Miles, manager of the New York City automobile show, for motorcycle space in the Grand Central Palace where the top floor will be reserved for this display.

**Emblem's 2319-Mile Trip.**

Mr. and Mrs. M. E. Gale, Angola, N. Y., made the round trip to the Denver convention of the Federation of American Motorcyclists on their twin Emblem motorcycle, made by the Emblem

Manufacturing Company, Angola, and fitted with a special side seat attachment. The entire trip occupied 13 days, the total riding time being 87 hours, with an aggregate mileage of 2319, or an average of 178 miles a day at an average speed of 27.5 miles an hour.

### Fighting Great White Plague.

As a result of an experiment made by the Wisconsin Anti-Tuberculosis Association, with headquarters in the Goldsmith building, Milwaukee, Wis., last summer, several Harley-Davidson motorcycles, made by the Harley-Davidson Motor Company of that city, are being used to good advantage in the crusade now being conducted in that state. An accompanying illustration shows a lecturer and his assistants in camp, these men being engaged in a rural campaign.

The work consists of placarding the country with health signs and giving talks at creameries, country cross roads and small villages, wherever a crowd can be assembled. A village usually is chosen for an illustrated lecture in the evening, and in working the surrounding country during the day, the health evangelists advertise the lecture. Stereopticon views are a feature of the talks, which are many times given out of doors. The stereopticon is operated from the luggage carrier of the motorcycle, being connected with the gas tank, which also supplies the headlight. The expense of this work is comparatively small, since each machine carries two men and all hotel bills are eliminated.

### Hamilton Resigns from Directorate.

President B. J. Patterson of the Federation of American Motorcyclists has received the resigna-

tion of G. H. Hamilton as a member of the board of directors. Mr. Hamilton states that he is not retiring from the organization, but will continue to take an interest in its affairs.

### Club Notes, Here and There.

P. E. Zimmerman, secretary of the Short Grass Motorcycle Club announces that the club is planning to attend the Chicago motorcycle show in a body. The plan contemplates meeting at Topeka or Kansas City and proceeding thence to the exhibition. The Short Grass Club contains many dealers in its membership.

The Milwaukee Motorcycle Club has secured a clubhouse at 26th and Wells streets, and owing to its size the membership of the organization has been limited to 150. Card rooms, pool and billiard rooms have been equipped

Special Agents of the Wisconsin Anti-Tuberculosis Association and Their Harley-Davidson Mounts in Camp.

and a steward has been engaged, so that when the club is in full running order meals will be served to club members.

The Atlantic City Motorcycle Club is preparing for its annual endurance run, to be held about Sept. 14. The route will extend to a point about 100 miles from the city and return.

The Beloit Motorcycle Club, with 50 members, has been formed at Beloit, Wis., with the following officers: President, R. S. Maxwell; vice president, Guy Carleton; recording secretary, Ray Talbot; financial secretary, Harvey Good; treasurer, Arthur Shevlin; captain, Claude Smith; first lieutenant, Carl Sparks; second lieutenant, Alva Grant.

The Nomad Motorcycle Club, Harrisburg, Penn., has elected the following officers: President, C. G. Sellers; vice president, Claude Baskin; secretary, J. N. Keller; treasurer, H. G. Heagy; executive committee, C. Baskin, Charles Uhler, John Stonnfez, L. King, H. C. Heagy, Harry Seacrist, William M. Patty; road committee, captain, Jean Schaub, B. Hepperly, M. Smiley.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in automobiles, accessories, supplies, etc.

**Anti-Rust Company**, Akron, O.; \$20,000; automobile accessories; C. T. Grant, Frank Rice, Lena Dewey, Bessie Rice, Alexander Sicherman.

**Mecca Automobile Society**, Wilmington, Del.; \$50,000; C. M. Miller, W. F. Vashell, L. T. Layton.

**Axwell Equipment Company**, Pittsburg, Penn.; \$5000; F. Patterson, W. J. Mulvihill, J. R. D. Huston.

**Walser Corporation**, New York City; \$10,000; Charles Pechner, Samuel Sperling, Solomon Strauss.

**Tyre Service, Inc.**, New York City; \$10,000; J. C. Travis, C. L. Clune, M. M. Hovey.

**Barnesboro Auto & Machine Company**, Barnesboro, Penn.; \$25,000; J. L. Berkebile, N. K. Harris, J. R. Musser, W. S. Wheeling, J. M. Crennan.

**Lanpher Rubber Tire Machine Company**, Carthage, Mo.; \$20,000; W. E. Brinkerhorf, Joseph Herrin, Earl Lanpher, John Dermott.

**Chicago Tire Goods Company**, Chicago; \$10,000; Louis Dulsky, Samuel Dulsky, J. E. C. Blake.

**Mount Vernon Auto Station**, Mount Vernon, N. Y.; \$3000; William Bunn, LeRoy A. Preston, Lucy Preston.

**Auto Supplies Export Company**, New York City; \$5000; F. W. Keegan, L. M. Fay, Antranik Aprahamian.

**Wilcox & Herr**, Indianapolis, Ind.; \$300; taxicab and transfer business; H. S. Wilcox, D. H. Herr, B. W. Rout.

**Motor Transportation Company**, Cincinnati, O.; \$250,000; George Schorr, E. H. Hoelscher, W. G. Hoelscher, H. A. Hoelscher, W. S. Vossler.

**Army Tire Company of New York City**, New York City; \$1,000,000; G. W. Griffin, F. H. Kessell, L. J. Roll, M. M. Algere, Jr.

**Howe Engine Company**, Indianapolis, Ind.; \$50,000; to manufacture motor fire apparatus; B. J. C. Howe, L. M. Howe, H. R. Howe, P. G. Howe, W. M. Hopkins.

**Chawck-Smith Automobile Company**, Louisville, Ky.; \$4500; J. T. Chawck, William J. Chawck, H. R. Smith.

**Monarch Auto Company**, Louisville, Ky.; \$10,000; C. H. Pierson, J. Gosnell, G. W. Aydelott, W. L. Kennett, T. G. Summers, A. T. Wingate, C. A. Colley, J. L. Morris, E. Coffman.

**United Traction Improvement Company**, Philadelphia, Penn.; \$100,000; W. J. Spangler, V. H. Conkle, H. S. Trego.

**Gramont Traction Plow Company**, Springfield, O.; \$600,000; A. W. Grant, P. A. Montanus, Oscar Kaser, Walter McKinney.

**Wright Auto Company**, St. Louis, Mo.; \$4000; C. A. Wright, W. B. Wood, A. A. Hopkins.

## GARAGE AND DEALER.

**R. D. Anderson**, Warren, O., dealer in American underslung cars, made by the American Motor Car Company, Indianapolis, Ind., adopted a unique method of advertising in the construction of the new garage and salesroom opened recently. Mr. Anderson so designed his new building that the front is almost an exact reproduction of the front elevation of the American machine, being built to resemble the radiator. The design has been carried out in detail, showing even the eagle which surmounts the radiator filler cap on the car, as will be noted by the accompanying illustration.

**The Hall Rubber Company**, 1402 Ridge avenue, Philadelphia, has taken the agency for Motz tires, made by the Motz Tire & Rubber Company, Akron, O., and will handle this product in eastern Pennsylvania, Maryland and Delaware. L. S. Hall, head of the company, is a veteran in the tire trade, which he knows from every angle.

**The Studebaker Corporation of America**, San Francisco branch, has changed location and is now at the corner of Van Ness avenue and Hemlock street, in much larger quarters.

**The Spiker Supply Company**, Scio, Hamilton county, O., has added an automobile supply department to its business.

**Horst & Streiter**, Rock Island, Ill., has rented the Rogers granary building at Byron, Ill., which will be remodelled preparatory to establishing a garage.

**The Piqua Auto Supply Company**, 133 North Main street, Piqua, O., has opened for business with a complete stock of supplies, accessories and machine shop equipment.

**The Torrington Welding Company**, Torrington, Conn., has been formed to conduct a garage and automatic gas cutting and welding business.

**Z. T. Eagleston** and **A. B. Shanks** have formed the Smithville Auto & Machine Company at Smithville, Tex., and a building on Second street has been rented.

**Glenn E. Brubaker** proposes to open a garage at Litchfield, Ill. A building is being remodelled for his use.

**Kowalke & Doty** is a new concern organized at Benton Harbor, Mich., to do automobile repair work. Its quarters are at 350 Territorial street.

**The Central Garage** is a new establishment opened by Thomson & King at 227 North Centre street, Phoenix, Ariz.

**The Lawrenceville Auto Company** has taken over the business of the Robinson Donaldson Buggy Company of Vincennes, Ind. The company will handle Studebaker, Lozier and Chalmers cars.

**The Cartercar Nebraska Company**, Omaha, Neb., of which W. E. Foshier is president, has secured a location on West Broadway and is to establish an agency at Council Bluffs, Ia.

**H. D. Graves**, who recently took over the Imperial Garage at Hartford, Conn., to handle the Henderson and Lozier cars, has combined his interests with the Capital City Auto Company, at Allyn and High streets, distributor of Mitchell pleasure cars and Stewart trucks. All these cars will now be marketed under the style of the

R. D. Anderson's American Car Agency in Warren, O.—Note Shape of Building Front.

**Claremont Garage**, Chicago; \$2500; J. F. Hutchinson, Jacob Diamond, A. S. Winslow.

**Packard Transportation & Repairing Company**, New York City; \$3000; John Santora, Anna T. Vacarelli, F. P. A. Vacarelli.

**Jenny Gasoline Extracting Company**, Chicago; \$25,000; J. N. Lucas, T. R. Barron, B. M. Osburn.

**Peerless Non-Puncture Company**, New York City; \$600; Maurice Uran, Harry Citret, Frank Eber.

**Turbine Muffler Company**, Chicago; \$2400; Joseph Libal, G. W. Gardner, J. J. Karchelser.

**Electric Auto Sales & Rental Company**, Chicago; \$12,000; Nathaniel Rubinkam, H. F. Tucker, G. C. McLaren.

**Michigan Motor Car Company**, Chicago; \$25,000; W. J. Pierce, E. D. Shuntluff, M. E. Shuntluff.

**National Association of Automobile Engineers**, Chicago; \$2500; commission and brokerage business and automobile, motor boats and accessories pertaining thereto; Leon P. Hutchins, A. L. Pettet, William Roles.

**T. S. Wheel & Manufacturing Company**, Chicago; \$2000; Fred Schulz, T. J. Smulski, Stanley Zukowski.

**Woods Mobillette Sales Company**, Chicago; \$15,000; F. A. Woods, E. F. Blettner, J. C. Long.

**Cincinnati Automobile Clearing House**, Cincinnati, O.; \$5000; Robert Uriche, C. F. Hornberger, A. R. Spangenburg, C. R. Chadwick, S. D. Bromley.

**Warner Detroit Motor Works**, Detroit; \$100,000; H. L. Warner, W. A. Gleesen.

*American Made for American Trade*

# NEW DEPARTURE

## Ball Bearings Throughout and Why

**B**Y the use of New Departure ball bearings throughout the entire Chassis, the manufacturer of this car has reduced power losses, repairing and operating costs to a minimum.

New Departure ball bearings eliminate friction. Friction is expensive, wears away the parts, hastens depreciation, and makes frequent repair necessary.

By eliminating friction New Departure ball bearings waste so little of the motor energy that maximum driving power is transmitted to the rear wheels. By eliminating friction there is practically no wearing away of the parts. The life of the entire car is longer and repairs are fewer.

All of these advantages are secured without sacrificing bearing efficiency. New Departure ball bearings will carry the load under all conditions of service equally as well as any bearing made.

Have you seen our interesting brochure on "Friction Elimination"? If not, drop us a card today and it will be forwarded to you by return mail.

## **NEW DEPARTURE MFG. CO., Bristol, Conn.**

**Western Branch, 1016-17 Ford Bldg., Detroit, Mich.**

When Writing to Advertisers, Please Mention The Automobile Journal.

Capital City Auto Company, of which Mr. Graves has been elected secretary, the other officers being: President, Bernard F. Smith; treasurer, W. F. Dahill.

**The Auto Tire Repair Company**, Oyster Bay, N. Y., has reopened for business following a recent fire. It is now in the Sagamore garage building on West Main street.

**Sharp & Robbins** has opened a garage on South Broad street, Trenton, N. J. The firm also operates a repair shop on South Clinton avenue.

#### WITH THE MANUFACTURERS.

**The Heinze Electric Company**, Lowell, Mass., is planning for the organization of a \$75,000 concern under the name of the Heinze Electric Company, Ltd., of Canada. The concern at Lowell manufactures electric apparatus, including Heinze magnetos and plugs. The new company is being created for the purpose of furnishing coils to the Canadian Ford factory, and will be established at Walkerville, Ont.

**The Bosch Magneto Company**, New York City, maker of Bosch magnetos, is increasing its supply stations throughout the country, and the following are the latest additions to the list: Pennsylvania Rubber & Supply Company, Cleveland, O.; Ozburn Automobile Supply Company, Inc., Memphis, Tenn.; Lemke Electric Company, Milwaukee, Wis.; W. D. Andrews Company, Syracuse, N. Y.; Diamond Motor Car Company, New Rochelle, N. Y.; George B. Wuestefeld Company, New Haven, Conn.; Newport Engineering Works, Newport, R. I.; Sloan & Clapper, Newburg, N. Y.; Hamilton & Bertram Motor Supply Company, San Diego, Cal.; J. G. McCrillis & Son, Manchester, N. H.; Automobile Supply Company, Tacoma, Wash.; G.

has broken ground for an addition to its present factory. The structure will be of uniform construction, with the main building, and will be used for the manufacture of gray iron castings.

**The Pharis Tire & Rubber Company**, Columbus, O., has a large force of men at work on the two buildings being erected as additions to its plant.

**The Evansville Commercial Truck Company**, Evansville, Ind., is negotiating for the plant recently vacated by the Reliance Truck Company at Owosso, Mich. The industrial committee of the Owosso Improvement Association has the matter in charge.

**John N. Willys**, president of the Willys-Overland Company, Toledo, O., maker of Overland cars, has purchased the assets of the Castle Lamp Company, Battle Creek, Mich. The machinery and stock of materials will be transferred to Toledo, where the manufacture of lamps will be carried on to supply Overland machines.

**The Hayes Wheel Company**, Jackson, Mich., has taken over the manufacture in this country of the shock-absorbing hub which was introduced by John Muir, the inventor, to the American trade, according to an announcement made following Mr. Muir's return to London, England. The hub is said to contain a large number of balls which distribute the road shocks before they are transmitted to the axle spindle.

**The Sternberg Manufacturing Company**, Milwaukee, Wis., maker of Sternberg trucks, has broken ground for an addition to the large plant erected three years ago. The new plant will cost \$50,000 and was made necessary because of the cramped condition of the present factory. With recently booked orders for commercial vehicles for American and South American use, an enlargement of

Thirty-Five Owners of King Cars, Recent Guests of King Motor Car Company, on Outing at Lake Orion, Mich.

W. Shroyer & Co., Dayton, O.; J. Edward Newton, Fall River, Mass.; Southern Auto & Supply Company, Chattanooga, Tenn.; G. Norman Baughman Company, Inc., Tampa, Fla.; McGraw Bros. Company, Jacksonville, Fla.; Fox-Shryock Auto Company, Fort Wayne, Ind.

**The King Motor Car Company**, Detroit, maker of King cars, was the recent host of 35 Detroit owners of King cars at Lake Orion, which has been taken by this company for two years, and at which it has been the host for a number of pleasant gatherings this year, including one composed of the men who sell the company parts and accessories. In this party were over 50 men, who enjoyed a two days' week-end outing. At each of these affairs the King company provides ample entertainment, and fishing and bathing form a large part of the amusements on each occasion. An accompanying illustration shows the owners who were present at the recent gathering.

**John D. von der Leith**, for five years connected with the Splittdorf Electrical Company, Newark, N. J., maker of Splittdorf magnetos, has severed his connection with that organization to enter business on his own account. He has formed the Reliable Auto Specialty Company, with headquarters at 306 Mott avenue, New York City, to handle automobile accessories in general, but magnetos, coils, spark plugs, cable and other ignition devices in particular. Mr. von der Leith is an electrical expert of high ability, and he starts on his new enterprise in the somewhat novel method of touring the country in a fully equipped car, demonstrating his goods in service.

**The Pontiac Motor Castings Company**, Pontiac, Mich.,

facilities was imperative. When the addition is finished the company will exactly double its working force and output of trucks.

**The J. I. Case Threshing Machine Company**, Racine, Wis., maker of Case cars, has equipped its new South works at Lakeside, Racine, with machinery. The plant consists of a foundry and machine shop. A power plant is being built and the drive will be electric throughout. Much of the company's motor car work will be done in the new factory.

**The Duplex Power Car Company**, Charlotte, Mich., at its annual meeting elected the following directors: Frank P. Town, M. J. Lamson, Maurice Bolstrom, George A. Williams, Frank L. King, Horton H. Bryan and Truman Gillette. Mr. Town and Mr. Lamson were elected president and secretary, respectively.

**E. J. Kaufman**, Canton, O., is to erect a factory for the manufacture of automobile parts.

**The Allen Motor Car Company**, Fostoria, O., will build additions to its present plant on North street, instead of adding to the Peabody Body Company's plant, as was formerly intended. The addition is to care for the increase in 1914 business.

**The Chandler Motor Car Company**, Cleveland, O., maker of Chandler cars, has moved into its new factory.

**The National Tube Company**, Pittsburg, Penn., announces that it has entered the electrical conduit field. It has contracted with the National Metal Molding Company and the Safety-Armorite Conduit Company, both of Pittsburg, to manufacture and sell this product for it as its agents under their various brands.

## RECENT PATENTS.

**Armored Hose**, William H. Eynon, Cleveland, O., No. 1,068,491. It comprises a tubular rubber body provided with a tubular layer of chain mesh made up of a strip of helically wound chain mesh having its ends vulcanized and spaced from the walls of the tubing.

**Valve Lifter**, Harry C. Rush, Dawson, Penn., No. 1,069,028. A valve lifter having a vertical plate, with its lower part provided with notches and the upper part with recesses adapted to take the operating lever. The last-named object carries a pivoted arm, which engages with the notches, locking the tool to permit of the use of both hands when working on the valve mechanism.

**Lock for Grease Cup**, Robert O. Hughes, Mankato, Minn., assignor of one-half to Bennett Williams of the same place, No. 1,069,071. The cup is formed with a socket on one side parallel to its axis, and the screw plug enclosure is retained by a U shaped locking member, which turns and is held by a spring.

**Windshield Hinge**, Charles H. Jockmus, Ansonia, Conn., No. 1,069,956. It comprises a hinge with a hub and a box adapted to turn on the hub. The hub is provided with a traverse hole and gripping blocks, which engage the hub, a screw passing freely through one block and having a threaded engagement with the other, a spring bearing against the screw and the unthreaded block, and an adjustable locking stop nut being on the screw.

**Signalling Device**, Gustave Fortmann, Philadelphia, assignor to the Auto Safety Signal Company, a corporation of Delaware, No. 1,070,028. It comprises a casing of semi-cylindrical form, having a flared lower end, and a flat transparent bottom secured in the lower section. Horizontal and vertical partitions separate the casing into three sections, in which are placed individual lights. A door closing the casing contains signalling characters in front of the two upper chambers. Provision is also made for a number plate.

**Auxiliary Air Supply Device**, John H. Holton, Lisbon, O., No. 1,070,131. An attachment for installation between the carburetor and the cylinders of a gasoline motor and so constructed that air is drawn into the combustion chamber by the suction of the piston. A valve is incorporated to prevent the air passing in any other direction than to the cylinders. The valve casing is provided with ports for fluids, such as for priming purposes, and there are means for closing the connection between the device and the cylinders, a form of petcock being employed.

## NEW BOOKS RECEIVED.

**What Others Say**, issued by the Duryea Motor Company, Saginaw, Mich. Contains a number of testimonials from various publications and writers bearing upon the two-cycle motor, air-cooling, and other features incorporated in the Duryea Buggyaut, made by this concern.

**New Departure Ball-Bearing Manual**, published by engineering department of the New Departure Manufacturing Company, Bristol, Conn. A treatise on ball bearings, describing and illustrating the removal and replacement of ball bearings, suggestions for proper maintenance, cleaning, enclosure, etc.

**The Flying Merkel Bicycles**, being a catalogue of the bicycles produced by the Miami Cycle & Manufacturing Company, Middletown, O., maker of the well-known Flying Merkel motorcycle. The booklet not only contains a detailed description of the various models produced, but is well illustrated and finely printed.

**A Hand Book on Automobile Electric Systems**, The Electric Auto-Lite Company, Toledo, O. The various electric motor starting and lighting systems are defined and illustrated, and the components explained. Instructions for proper care and maintenance are given very clearly. One of the interesting features of the book is the large chart for locating troubles. The various terms are explained and troubles cross indexed. The book is printed on nice paper and is well illustrated.

**Electrical Installations on Automobiles and Motor Boats**, Packard Electric Company, Warren, O. The contents deals with the various ignition, lighting and starting systems utilized on automobiles and motor boats, and the components and principles involved are explained in a non-technical manner for the benefit of the novice. The book is profusely illustrated, the various wiring plans of ignition systems being plainly lettered and the parts colored to make clear their application. Methods of locating faulty ignition are included in the contents. The laws regulating the operation of motor boats, as well as instructions for care and maintenance of storage batteries, are among the features of the publication.

## BUSINESS DIFFICULTIES.

R-C-H Corporation, Detroit. Security Trust Company, Detroit, receiver. Operation will be continued, to take care of 7000 orders for machines now on file.

Muncie Gear Works, Muncie, Ind. Eugene Vatte, receiver. Liabilities, \$277,061.80; assets, \$204,752.03. Orders now on hand total \$400,000.

Michigan Buggy Company, Kalamazoo, Mich. Detroit Trust Company, Detroit, receiver. Liabilities, \$1,600,000; assets, \$2,000,000.

Webb Company, Allentown, Penn. Robert E. Wilbur recommended to take charge of the business.

Lansden Company, Allentown, Penn. Morton E. Kern, receiver. Liabilities, \$193,000; assets, \$304,046.

Walpole Tire & Rubber Company, Walpole, Mass. Robert C. Fisher, receiver. Liabilities, \$2,773,271; assets, \$4,126,638. Temporarily embarrassed through the failure of the Atlantic National Bank, Providence, R. I., which was carrying some of its paper.

Want Dealers in  
New England  
Cities to Handle  
Planhards

June 30, 1918.

Planhard Mfg. Co.—My engine on Excelsior is a home-made 2 cycle 8 cylinder 4 1/2 x 5 inch. The very best I ever did with the 8 carburetor was 380 R. P. M., and I am now making 625 under the same conditions with a Planhard. Two years ago in the New York to Albany race I used 105 gallons of gasoline in 27 hours 57 minutes. This year I only used a trifle over 65 gallons. I had to sell surplus gasoline at Edgewater for 18 cents that I paid 22 for in Albany, as I had no place to store it, so you see how it worked. The race just completed was splendid, and I should have done better time had I followed the New York M. B. C. courses better, but I disobeyed its instructions and ran on a mud flat above Cossackie. Coming back my timer broke when I was off Fishkill Landing and I limped home, making wooden plugs as fast as they were away. However, with all delays the Planhard enabled me to beat my previous record 1 hour 45 minutes. Thomas Trolsen.

## Best Croxton Could Find

The Planhard Mfg. Co.

May 20, 1918.

Gentlemen—We have decided to adopt the Planhard as "Croxton" carburetor equipment because we find it excels all others in economy, power, speed and most important of all in a pleasure car—flexibility.

We determined to make the "Croxton" superior to any automobile in its class in every way, and only the best accessory of its kind, regardless of price enters into its makeup.

Realizing the importance of the carburetor as the most vital single factor in the operation of a car—especially now with the low and variable grades of gasoline commercially available, we determined that the "Croxton" should be the most modern, dependable and faultless, in this all important respect.

With this end in view, we laid out a series of heart-breaking tests for carburetors that would leave no doubt whatever as to the results of our decision. Your carburetor left all others at the post.

We congratulate you on your possession, and wish you every success.

Very truly yours,

THE CROXTON MOTOR CAR CO.,

J. P. Stoltz, President.

## 25 Miles to Gallon on Ford

North Fairfield, O., May 16, 1918.

Gentlemen—After taking the old carburetor off my Ford car and putting on a Planhard, I increased my mileage from 18 to 25 miles per gallon, and my engine, which was a notorious heater, runs as cool as desirable for the best results. I am using 60 to 62 gasoline, and as I have a hydromoter, I know what I am talking about. A. W. Grandon.

## TRY THE M & M ECONOMIZER FOR SPEED, POWER AND ECONOMY

### HOW ABOUT THIS LETTER!

Moller Bros., Controller & Economizer Co., Lewistown, Pa.: Auburn, N. Y., August 14th, 1918.

Gentlemen:—I am much pleased with the M&M Economizer that I put on my REO touring car a few weeks ago. I am using a carburetor, which gives a very high mileage per gallon, but with the use of your Economizer I get several more miles per gallon, thereby making a marked saving in gasoline.

It also entirely eliminates the use of brakes, except on very steep grades, which saves much wear on brakes, and I believe is a saving on tires also. It takes a few days' practice to become familiar with the use of the Economizer, but any one will be well paid for their trouble in learning to use it. I would not part with mine for several times the price and cost of installing.

Yours very truly,

(Signed) F. LEE RODGERS.

WHAT COULD BE MORE CONVINCING THAN THE ABOVE LETTER! ALSO, the M&M is guaranteed to do just what we claim, and if it proves unsatisfactory within thirty days, YOUR MONEY WILL BE REFUNDED. (Reference—Citizens National Bank, Lewistown, Pa.)

The M&M is guaranteed to save from 40 to 50% of gasoline, and increase the speed and power 20% with less gasoline, and less carbon. It is the only known carburetor adjuster on the market, and RANKS FIRST AS A CARBON ELIMINATOR. For priming the motor, you cannot find its equal. PLEASE BEAR IN MIND—THERE IS NO SCREEN, or any other obstacle placed in the manifold, as this will have a tendency to CLOG THE MANIFOLD, and make it more difficult for the motor to absorb the gas and air.

Price of the M&M—\$3.50 and 17c extra for postage. We include either friction foot pedal, or steering post control, which consists of flexible shaft and wire. Requires 3/4" pipe tap. Elbow will be furnished upon request.

PRICE OF THE MOTORCYCLE SIZE—\$1.25 Prepaid. Size 1/4".

THE M&M ECONOMIZER IS "THE PATENTED ONE." Warning to users, makers and dealers, PATENT NO. 922,528—May 25, 1909.

WRITE US FOR FURTHER INFORMATION AND CATALOG.

FOUR CYLINDER MODELS THE CAR THAT MADE SIX CYLINDER MODELS

Manufacturers of Klaxon Horn say that the reason they recommend Burn-Bostons is because "the ordinary dry cell lasts four to six weeks for ordinary touring purposes before the voltage runs too low"—Burn-Bostons on two test runs conducted by the Klaxon people sounded the equivalent to fifty calls per day for two years.

If your dealer hasn't them send us his name and we'll see that you are supplied

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

# NOTICE

We respectfully call attention to the fact that the Knox Automobile Company is the only other manufacturer licensed to build tractors under the "Martin" patents and other patents owned by Mr. C. H. Martin. These patents, we believe, cover every possible, practical combination of a self-supporting and steerable tractor, with a non-self-supporting trailer. The patents comprise the following: —

|        |            |               |
|--------|------------|---------------|
| Hunter | 670,405,   | Mar. 19, 1901 |
| Hunter | 696,143,   | Mar. 25, 1902 |
| Hunter | 625,953,   | May 30, 1899  |
| Thayer | 678,063,   | July 9, 1901  |
| Martin | 1,018,248, | Feb. 20, 1912 |
| Hight  | 698,836,   | Apr. 29, 1902 |
| Liebau | 655,724,   | Aug. 14, 1900 |

and numerous applications are now pending in the United States Patent Office.

This notice is merely in the nature of general information.

**Care and Repair of Tires**

**GET THIS AUTOTIRE BOOK FREE**

Here is a handy little book brimful of practical points which every automobile owner wants to know. Gives all kinds of information about tires—how to prevent troubles, how to repair best, quickest and at least expense. Tells about the wonderful machine, the

**SHALER Electric Vulcanizer**

"It Makes One Tire Outwear Three." The Shaler repairs any kind of puncture, cut, blow-out, or tear in any outer casing or inner tube. Automatic—makes a perfect weld. Never burns or undercures. For garage or home use, direct or alternating current, or for road use with alcohol. \$10 up. Costs ½ c per hour to operate. Absolutely guaranteed. Send Your Name Today and we will mail our interesting tire book "Care and Repair of Tires." Gives a remedy for every tire emergency. It's free postpaid.

Garage and Repairmen should also write for our money making hand book.

**C. A. SHALER CO., 961 4th St., Waupun, Wis.**

**GOOD YEAR**  
AKRON, OHIO

This name on Automobile Tires and Rubber Accessories signifies inherent qualities of material and workmanship that insure the maximum of service at the minimum of expense.

**THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO (672)**

**Cartercar**

With the gearless transmission—will give better service than is possible for a gear car. Unlimited speeds—climbs steep hills—gives double the usual tire mileage.

**CARTERCAR COMPANY, Pontiac, Mich.** Send for catalog

**Abbott-Detroit**

"The demand of the day is that an organization shall be judged by its product and not by what it claims for itself." Keep this in mind when you examine the 1913 models of the Abbott-Detroit.

PAWTUCKET R.I.

September 10, 1913

Correct automobile lubrication is a serious problem. But its fundamentals are simple. We will cover them in plain question-and-answer form.

**Question:** What moves your car?

**Answer:** Power.

**Question:** What determines your power?

**Answer:** Your motor, your fuel and your lubricant. If any one of these factors falls short in full efficiency, you receive less than full power. The greater part of the power lost is taken up by friction—wear on the moving parts.

**Question:** What will give you the most efficient lubrication?

**Answer:** An oil of the highest lubricating qualities whose "body," or thickness, is best suited to the feed requirements of your motor.

**Question:** Suppose you use oil of lower lubricating quality or of less correct "body". What are the penalties?

**Answer:** Many. Among them are:

(1) Escape of the explosion past the piston rings. (2) Unlubricated cylinder walls at the upper end of the piston stroke. (3) Imperfect lubrication of many of the bearings. (4) Excess carbon deposit. (Due to the oil working too freely past the piston rings and burning in the combustion chamber.) (5) Excessive oil and fuel consumption. (6) Worn wrist pins. (7) Rapid and unne-

cessary deterioration of your motor. (8) Loose bearings. (9) Noisy operation.

**Question:** How can you determine the correct oil for your car?

**Answer:** By consulting our lubricating chart which will be mailed you on request.

**Question:** What assures the reliability of this chart?

**Answer:** The chart is the result of the most far-reaching and most thorough study of automobile lubrication that has ever been undertaken.

It was prepared by a Company whose authority on scientific lubrication is recognized throughout the world—the Vacuum Oil Company.

It was prepared after a careful analysis of the motor of each make and each model of American and foreign car.

The superior efficiency of the oils specified has been thoroughly proven by practical tests.

*If you use oil of lower lubricating quality or of less-correct "body," than that specified for your car, your motor faces unnecessary friction, loss of power, and ultimate serious damage.*

A booklet, containing our complete lubricating chart, together with points on lubrication, will be mailed on request.

## Mobiloil

**A grade for each type of motor.**

The various grades, refined and filtered to remove free carbon, are: Gargoyle Mobiloil "A", Gargoyle Mobiloil "B", Gargoyle Mobiloil "D", Gargoyle Mobiloil "E", Gargoyle Mobiloil "Arctic".

They are put up in 1 and 5 gallon *sealed cans*, in half-barrels and barrels. *All are branded with the Gargoyle, which is our mark of manufacture.* They can be secured from all reliable garages, automobile supply stores, and others who supply lubricants.

## Our Exclusive Feature

We will (at small extra cost) furnish  
our Regular Models with the

# AUSTIN Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.  
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

|   |   |   |           |
|---|---|---|-----------|
| Model "77" Six Cylinders, 4 1-2 x 17    | - | - | \$6000.00 |
| Model "66" Six Cylinders, 4 1-2 x 5 1-2 | - | - | \$5000.00 |
| Model "55" Six Cylinders, 4 x 5         | - | - | \$4000.00 |

**MORE NEW, IMPROVED and DISTINCTIVE FEATURES** than any other car. Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals.

*Write for complete description and any information you may desire in regard to our two-speed axle.*

## Handle the Haynes and auto buyers hunt you up

Few people will buy cars the coming year without seeing the Haynes—America's First Car—with its year-ahead features, including the Electric Gear Shift

Usual customs and circumstances are being reversed this year among Haynes dealers. They have no problem of "scaring up prospective buyers"—whom they may develop through much talking and demonstrating, into buyers, and more often may not.

Prospective automobile buyers are hunting up the Haynes dealer, to see the car they have heard so much about—they are eager to see the Electric Gear Shift and try it for themselves.

## The Electric Gear Shift

draws prospective buyers in crowds to see the

# HAYNES

*America's First Car*

They are as eager to see the Electric Gear Shift and try it for themselves as our dealers are to show them. Everybody has heard about the wonderful Electric Gear Shift. Wonderful is the only name strong enough to fit the device by which the gear lever is entirely superceded—relegated to the tool box—while the shifting of gears is accomplished in the simple, easy way of pressing push buttons, conveniently located on the steering wheel.

Model 27—118-inch wheelbase, 4-cylinder. Biddle & Smart coupe body. Price, \$2700.

When Writing to Advertisers, Please Mention The Automobile Journal.

Everything that adds comfort, convenience and service, is standard equipment in the Haynes.

### Specifications of the New Haynes

**Motor**—Bore 4 1-4 in., Stroke 5 1-2 in. L-head Haynes. Cylinders cast in pairs. Model 26, A.L.A.M., 48.35 H. P., Dynamometer 65 H. P. Model 27, A.L.A.M., 48.35 H. P., Dynamometer 65 H. P. Model 28, A.L.A.M., 29.9 H. P., Dynamometer 48 H. P.

**Weight**—Model 26, 3800 lbs., Model 27, 4000 lbs., Model 28, 3400 lbs.

**Cooling**—Centrifugal pump and pressed steel fan.

**Wheel Base**—Model 26, 130. Model 27, 136. Model 28, 118.

**Ignition**—American Simms' Magneto.

**Carburetor**—Stromberg.

**Lubrication**—Splash and gravity feed.

**Control**—Left hand. Vulcan Electric Gear Shift.

**Transmission**—Selective Type, three speeds forward, one reverse.

**Steering Column**—Worm and worm gear type.

**Clutch**—Haynes contracting steel band.

**Rear Axle**—Full Floating Timken on Models 26 and 27; McCue, Model 28, Gourney Bearings.

**Front Axle**—I-Beam. O. H. steel heat treated.

Hand lever shift optional at \$200 reduction.

**Wheels**—Artillery type. Funk demountable rims.

**Tires**—Models 26 and 27, 36x4 1-2. Model 28, 34x4.

**Springs**—Front Semi-elliptic 39 1/2x2, rear 48x2.

**Brakes**—15 1-4 external and 15 internal Models 26 and 27. 12 and 16 internal on Model 28.

**Finish**—Indiana dark blue body. Pacific Tour gray, optional.

**Gasoline Feed**—Pressure, Automatic feed.

**Upholstery**—Buffed leather. Deep cushions.

**Starting and Lighting**—Leece-Neville electrical system.

**Cowl-board Equipment**—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge and speedometer. Models 26 and 27 have rim wind clock.

**Other Standard Equipment**—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind-shield, Vulcan Electric Gear Shift, two large electric head lights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 12 volt, 80 ampere hour storage battery, speedometer, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim and Collins curtains. Models 26 and 27 have Truffault-Hartford shock absorbers.

# HAYNES

## cars literally sell themselves

They draw large numbers of prospects to the salesrooms of our dealers. We are, also directing to our dealers, dozens of people who have taken the trouble to write us for our nearest dealer's name.

Once a prospect starts investigating the Haynes, he cannot be satisfied with any other car. The pride of owning the Haynes, America's First Car, its reputation for power, speed and reliability, coupled with everything in the way of up-to-date equipment—including electric starting, lighting and the Vulcan Electric Gear Shift—makes the Haynes the most sought-after car on the market.

### The Haynes Automobile Co., 6 Main St., Kokomo, Indiana

Model 27—136-in. wheel-base, 6-cylinder, 7-passenger body. Price, \$2785.

# 60 "SIX" KISSELKAR 60 "SIX"

**The Big Car that Pioneered Downward Prices Maintains Its Leadership as a Car of Unsurpassed Ability, Elegance and Comfort.**

Point for point this powerful, silent, thoroughbred KisselKar 60-"Six" challenges critical comparison. Its symmetry of design, perfect poise and balance, and long, clean, graceful lines appeal irresistibly to your sense of beauty and fitness.

At first sight you feel instinctively that this big KisselKar "Six" is a car that you would be proud to own. Your first road test will disclose the exceptional riding qualities of this "greyhound of the highways." Gliding smoothly along in this superb car of comfort, you realize the utmost limit of motoring delight.

The exceptionally liberal 142-inch wheelbase, the big wheels and over-size tires, shock absorbers and eleven inches

of seat upholstery reduce road vibration to the minimum. And the unusually spacious tonneau and deep pitched seats permit you to recline at ease, unaffected by the "lurches" and sidesway incident to ordinary motoring.

The lighting facilities are strikingly original, especially the illuminated instrument board and special lights that sweep the full length of the running boards, and the "bull's-eye" in the tail lamp, the rays of which directly reach the gasoline gauge. The Golde patent "one man" top, Warner speedometer, Klaxon horn and many other features of the highest priced cars are all found in the KisselKar 60-"Six" equipment.

The KisselKar 60-"Six" at \$3150 is a wonderful value that easily

leads the "big Six" field. Price of the new KisselKar 48-"Six" is \$2350; KisselKar 40-"Four," \$1850. All KisselKars are fully equipped, and are electric lighted and started. They have left hand drive and center control.

## KisselKar Service Contract

The KisselKar is sold under a written guarantee of service to owners—a tangible, definite and specific contract that clearly stipulates the scope of KisselKar Service and provides mechanical care that forestalls trouble and retards depreciation.

**KisselKar Trucks—1500 lbs. to 6 tons—are used in over 200 distinct lines of business.**

**Write for Truck Catalog.**

These new KisselKar Models are now being shown by our representatives everywhere. See your nearest Dealer for demonstration, or write us for complete catalog.

# INVADER OIL

## A PURE OIL

The railroads do not buy their oil by the gallon—they buy it by the mile. The reason is obvious.

The automobilist is apt to think that the selection of a cheap oil is simple. It is the reverse. It is complex.

Into the matter enter such questions as the relation between miles travelled and gallons consumed, and the relation between cost of up-keep and cost per gallon per mile.

Although many different brands of oil are being called to your attention by extravagantly worded advertisements, it is a well-known fact that the scarcity and increased cost of Pennsylvania Crude has lowered the gravity and consequently the quality of lubricating oil, just as it has lowered the gravity and quality of gasoline. This parallel is exact.

Invader Oil is one of the few high gravity, one hundred per cent. Pennsylvania Oils now being marketed and its use will prolong the life and efficiency of any gasoline motor. It is the cheapest because it is the most efficient. It costs less in dollars and cents per thousand miles than any other oil made.

# i-o-c GEAR OIL

## A NOISELESS OIL

I-O-C Gear Oil is the only oil ever made especially and exclusively for the lubrication of automobile transmission gears.

It is absolutely different from any other oil made and possesses certain peculiar properties that cause it to face the gear teeth with a coating that is practically indestructible and prevents wear and reduces noise and friction to a minimum.

It contains no foreign matter such as ground cork, sawdust, etc., but is 100 per cent. OIL, and being free from water and chemicals it will not foam in the case when running or allow the bearings to rust when idle.

Remember, it is only the OIL, which a grease contains that has any lubricating value. I-O-C Gear Oil is not only all oil, but it's the only oil that will eliminate the hum or grind of metal gears.

### A 10 Lb. Can Costs \$1.50

A trial will convince the most skeptical that I-O-C Gear Oil is better than any grease, any dope, any compound, or any other form of gear lubricant ever put on the market.

10 LB. CAN

Compared with the millions of people who ride in motor cars, the number of those who sustain accidents from this mode of travel is a very small percentage. A certain percentage of accidents is inevitable, but it is so small that the most pessimistic person alive does not think for a moment that motor cars as they are built today are unsafe.

But if there is a single stone left unturned to minimize the percentage of accidents, every manufacturer will, sooner or later, make the necessary refinements in his cars. The refinement we point to is the replacement of wooden wheels by steel wire wheels.

Possibly the most likely illustration of this point is found in the way railway companies have developed their trains from the wooden passenger cars to "all-steel" passenger coaches and Pullmans in order to get SAFETY FIRST, with comparatively greater speed and comfort.

We hardly ever think of safety without it bringing to our minds the closely related thought of strength—strength to provide safety.

In every test engineers could conceive that would allow them to arrive at the relative strength of wire and wooden wheels, wire wheels have shown a uniform superiority both as to carrying strength and as to their ability to resist side thrust. The figures which give the best idea of relative strength show that Wire Wheels have a carrying strength from five to seven times as great as wooden wheels, and that their strength to resist side thrust (such as skidding into the curb would be) is nearly 15 times that of wooden wheels.

These tests gave engineers certain data to go upon and the next step taken was to keep the performance of various wire wheel equipped cars under constant observation as they went about in every day use. Invariably wire wheels have lived up to the reputation gained under test.

In the recent Grand Prix Race at Amlens a wire wheel equipped car collided with an embankment and turned completely over. Because one of its rear tires was ripped it was necessary to change a wheel, but the front wheel, which sustained a far heavier blow, was left on and the car continued in the race after having been righted.

So much evidence of their superior strength could be piled up that all question of safety is answered far better by wire wheel equipment than with wooden wheels. It is part of a decided movement which has characterized means of travel toward all-metal construction. Note the increasing number of American made cars which are showing their new models equipped with wire wheels; the movement is almost universal.

## When the Repair man performs the Autopsy

he finds, nine times out of ten, that *poor lubrication* has caused all the costly havoc. Then he asks the simple question,

"Why don't you use

TRADE MARK  
**NON-FLUID OIL** ?"  
REGISTERED IN  
PATENT OFFICE  
UNITED STATES

and he tells in his honest way what he, as a mechanic, knows about the depredations of cheap lubricants.

## Why don't you use **NON-FLUID OIL**?

Get the genuine in orange colored cans.

# Overland

1 9 1 4

**T**HE 1914 Overland is ready for demonstration and delivery. See full description on *opposite* page. Our production for next year has been *increased* to 50,000 cars. This greatly increased production, combined with the natural manufacturing economy of restricting ourselves to *one chassis*, again enables us to make our customary annual offer of *considerably* more car for *considerably* less money.

While the price has gone *down* the value has *gone up*. The motor is *larger*; the wheelbase is *longer*; the tires are *larger*; the tonneau is *roomier*; the equipment is *better*—including such costly additions as *electric lights*; the body is *more handsomely finished*, in rich dark Brewster green, with heavy nickel and aluminum trimmings. In fact, in every single and individual respect it is an *improved* car at a *reduced* price.

We already have applications on file for *more* cars than we could deliver during the month of August. Therefore, it is advisable for you to see the nearest Overland dealer *promptly*, in order to secure an *immediate* delivery.

1914 catalogue on request.

*Please address Dept. 52*

## The Willys-Overland Co., Toledo, Ohio

Flush U doors with disappearing hinges

**MOTOR**—Four cylinders, cast singly and set off center. Bore 4-1/8 inches, stroke 4-1/2 inches. Five bearing crankshaft; three bearing camshaft. Improved type of pushrods and guides, adjustable and easily removable.

**COOLING**—Thermo-syphon, or natural water system, without pump. Radiator has large tubes and all water pipes and connections are extra large, insuring perfect cooling.

**FRAME**—Pressed steel channel section reinforced with angle irons and cross members, hot-riveted.

**CLUTCH**—Leather-faced cone, with new type brake to permit noiseless gear changing.

**TRANSMISSION**—Selective, sliding gear type, with three speeds forward and reverse. Center control. Gear case, extra strong, cast in one piece, keeps all bearings in line. Main and countershafts are short, preventing any springing.

**LUBRICATION**—Splash system, pump circulated, with sight feed on dash.

**BRAKES**—Double, contracting and expanding on drums on rear-wheel hubs, easily ad-

justable. Either set of brakes will keep car under perfect control at any speed, with full load.

**SPRINGS**—Semi-elliptic front, three-quarter elliptic rear, with bronze eye bushings all around and compression grease cups on all bolts.

**STEERING GEAR**—Worm and gear type, easily adjustable and anchored to side frame member. Column of large diameter. Wheel 18 inches in diameter.

**FRONT AXLE**—I-beam section, drop-forged in one heat, without welding. Timken bearings in front wheel hubs.

**REAR AXLE**—Three-quarter floating type. None of the weight of the car on the driving shafts. Hyatt bearings in rear wheel hubs.

**WHEELS**—Hickory, artillery pattern, with twelve spokes, and bolts in each.

**BODY-FINISH**—Brewster green, with light green striping. All exposed metal finished in nickel or aluminum.

**BODY**—Five passenger; metal reinforced with wood framing.

*Completely Equipped \$950. With Gray & Davis Electric Starter and Generator—\$1075 f. o. b. Toledo.*

## Another Bosch Victory

### —Of Course—

A rigorous test again is given Bosch Magnetos and Plugs and again they prove their superiority over all. ∴ ∴ ∴

**1st Stutz —Bosch Magneto and Plugs**  
**2nd Mason—Bosch Magneto and Plugs**  
**3rd Mercer—Bosch Magneto and Plugs**

Not only did Bosch make its usual clean sweep but the Stutz broke the record for the course and the Mercer for the lap.

There is more vim, vigor and snap in Bosch Ignition than possibly can be obtained otherwise.

## CLEAR PROOF OF THE HIGH QUALITY AND POPULARITY OF MULTIBESTOS BRAKE LINING

is found in the fact that the large and increasing demands for it have forced us to extend our facilities of production and build a new factory. Our two plants at Worcester have been vacated and we are now to be found in our new home at

**Framingham, Mass.**

We hope that our friends will note this change of address for we count the loyalty of a wide circle of friends as our one best asset. It is relying upon a continuance of this loyalty, together with the hope of making many new friends, that we build our hopes of a busy future with many chances to serve—and serve with satisfaction.

One thing we promise—that the same features which have made Multibestos the standard of quality in brake linings in

the past will be maintained and preserved in our future production, and that there will be no change in specifications or basic materials. In our other departments too, provision has been made for an increased production so that we can turn out a full line of woven fabrics for mechanical purposes. We are particularly equipped for the manufacture of clutch linings and friction facings in special forms and sizes and treated in a way to adapt them for any conditions of service.

*Send us your inquiries. You will find our proposition interesting and advantageous.*

## NEW ERA IN FIRE-FIGHTING METHODS.

**Remarkable Impartial Test of Motor Pumping Engines Conducted by National Board of Fire Underwriters in Connection with Forty-First Annual Convention of International Association of Fire Engineers in New York City.**

**A**PPARENTLY the 41st annual convention of the International Association of Fire Engineers, which opened in the Grand Central Palace, New York City, Sept. 1, and came to an end late Saturday night, Sept. 6, marked the beginning of a horseless era in the fire department. In the exposition of fire apparatus, which has been an interesting feature of nearly every convention of the organization, there was

untermers were still very much in evidence, and the prancing fire horse was not yet a generally accepted emblem of the service. Thus the International Association of Fire Engineers has witnessed the

rise and fall of the horse as a necessary factor in fire fighting. The superior possibilities of the motor driven apparatus are now acknowledged, and while there may still be some remnant of distrust concerning the gasoline pumping engine, the ex-

not a single piece designed to be drawn by horses.

The first convention was held in New York City in 1873, when the red shirts of the old vol-

hibits this year demonstrated that the automobile industry is prepared to meet every objection at this point by supplying tract-

**Demonstration of Fire Boats Off Battery Park for Benefit of Visiting Firemen.**

ors capable of hauling the old steamer wherever needed. And the gasoline pumping engines did their full share to convince the assembled firemen of their ability to cope with the situation.

It is estimated that something over 1200 fire chiefs, commissioners and men of various rank were present when President H. F. Magee, chief of the department in Dallas, Tex., called the convention to order. President Magee first introduced Chief John Kenlon of the New York department, who in turn presented Fire Commissioner Joseph Johnson, who delivered the address of welcome in the absence of Mayor William Gaynor on account of illness. The reply was made by Charles H. Henderson, chief of the department in Bradford, Penn. Immediately after these addresses honorary membership was conferred upon Chief M. J. Meier of Amsterdam, Holland; Divisional Chief Arthur R. Dyer of London, England, and Major E. T. Walker, in charge of the fire department in Alexandria, Egypt.

Throughout the week various activities of more or less direct interest to the association as such were held, these including the unveiling of a monument to the memory of those who had given their lives in the performance of duty at fires, in connection with which

many members of the association and veteran firemen of New York City and many nearby cities took part in a street parade. A portion of another day was taken up with a demonstration of 10 fire boats off Battery park, and a trip to Coney Island. These features of the programme were not permitted to interfere in any manner with a close inspection of the machines on display in Grand Central Palace, certain portions of each day being set aside for this particular purpose. The list of exhibitors included the

following and their products:

American & British Manufacturing Company, Providence, R. I.—Gasoline-electric driven steam fire pump and demonstrator of the same type on the street.

James Boyd & Bro., Philadelphia, Penn.—Combination hose and chemical on White chassis, and four-cylinder, 60 horsepower combination hose and chemical, with squad body and Kanawaha system of chemical discharge.

American-La France Fire Engine Company, Elmira, N. Y.—Two 75-foot aerial ladders and tractor, 65-foot aerial ladder and tractor, type 15 pumping engine, type 10 combination, type 12 triple combination fire engine and tractor, type 14 city service machine, two small chemicals, fire engine and tractor. Also Niagara No. 1 self-propelled steam engine, first to be made in America, rebuilt by this company for New London, Conn., in 1912.

Knox Automobile Company, Springfield, Mass.—Three pumping engines, triple combination hose and chemical, piston pump, single tractor and tractor and converted steam engine from department in Springfield, Mass. Also as demonstrators steamer and 75-foot aerial ladder with tractor.

Seagrave Company, Columbus, O.—Six-cylinder, 146 horsepower pumping engine of 1000-gallon capacity; four-cylinder, 53 horsepower chemical and hose wagon; 75-foot aerial ladder truck and six-cylinder, 80 horse-

power tractor; six-cylinder, 80 horsepower city service wagon.

International Motor Company, New York City—Mack tractor and converted horse ladder truck, hose wagon with turret nozzle for New York City department, hose wagon and combination hose and chemical.

Pope Manufacturing Company, Hartford, Conn.—Shaft driven combination hose and chemical, and chain driven combination hose and chemical.

Robinson Fire Apparatus Manufacturing Company, St. Louis, Mo.—Four-cylinder pump and six-cylinder pump.

Front Drive Motor Company, Hoboken, N. J.—Christie tractor and steam fire pump.

Ahrens-Fox Fire Engine Company, Cincinnati, O.—Six-cylinder pump and combination chemical.

Waterous Engine Works Company, St. Paul, Minn.—Six-cylinder pump.

Luitwieler Pumping Engine Company, Rochester, N. Y.—Four-cylinder, 57 horsepower pump.

Martin Carriage Works, York, Penn.—Type A, four-cylinder combination hose and chemical wagon.

Nott Fire Engine Company, Minneapolis, Minn.—Two four-cylinder pumping engines and one six-cylinder.

There also was a large showing of parts and accessories, among which may be mentioned the patented wheel construction of the Sewell Wheel Company, Detroit; a gasoline storage system, for which special fireproof features were claimed, by the Martini & Huneke Company of America, New York City; fire extinguishers by the Pyrene Company, New York City; fire signals, fire protectors and life saving devices by the McNutt Non-Explosive Can Company, New York City, and products of the Sheldon Axle Company and Timken-Detroit Axle Company, Detroit; Republic

Rubber Company, Youngstown, O.; Dayton Rubber Manufacturing Company, Dayton, O.; B. F. Goodrich Company, Akron, O., and New Departure Manufacturing Company, Bristol, Conn.

Without doubt, the most interesting feature of the convention was the 12-hour continuous test of 11 pumping engines, conducted on the pier at the foot of West 54th street, Wednesday. The approximate capacities of the various machines had been determined at preliminary trials during the previous week, and this test com-

prised the following: Six hours' run at full capacity, at not less than 120 pounds net pressure, pumping through three lines of hose siamesed into one nozzle; three hours' run at not less than half capacity, at not less than 200 pounds net pressure, pumping through one line of hose and nozzle, and three hours' run at not less than 250 pounds net pressure, pumping through one line of hose and nozzle.

Not only was this the first test of this kind ever conducted, but the machines were turned over to a committee representing the National Board of Fire Underwriters, which supplied the officials and conducted every feature of the tests. The results presented in tabulated form on the next page therefore are of exceptional interest.

**Knox Combination Pumping Engine and Hose Wagon with Rotary Gear Pump.**

## DETAILED RESULTS IN PUMPING TEST.

No. 1—Seagrave, 1000 Gallons.

| Hour | Pump pressure | Size nozzle | Nozzle pressure | Mins. in operation | Gals. a minute | Total discharge |
|------|---------------|-------------|-----------------|--------------------|----------------|-----------------|

Grand total discharge.....210,408

First hour valve covers on Nos. 3 and 4 cylinders leaky—started at 6:50; engine working on Nos. 2 and 3 cylinders (ignition trouble); shifted to battery and engine worked O. K. Second hour, radiator steaming badly; carburetor out of adjustment and engine irregular in action; this was adjusted and engine worked O. K. Third hour, engine shut down at 8:54—clutch burned out; clutch set up tight and engine started up at 9:20. Eighth hour, bolt dropped out in cross head; shut down 1:47 to 1:57. Ninth hour, withdrew from test at 2:57; hot bearings.

No. 5—American-La France, 1400 Gallons.

Grand total discharge.....388,635

First hour, engine shut down 6:50 to 6:52 to replace bolt on end of fire pump connecting rod. Second hour, engine stopped 8:27 account of tight bearing; plenty of oil used and engine started up 9:00. Third hour, 9:15, pump bearings heated; cooled by application of water until 9:35; motor missing from 9:17 to 9:25. Ninth hour, pump bearings cooled by application of water at 4:15. Tenth

hour, 4:25 to end of test, pump operating poorly, owing to defective suction valves.

Grand total discharge.....392,716

First hour, valve rocker arm bolts loose on Nos. 5 and 6 cylinders 7:45; engine continued in operation. Second hour, missing on No. 4 cylinder; inlet valve spring broken at 8:00; shut down at 8:16 to replace and started up at 8:45. Third hour, riveted rocker arm pins to prevent loosening, while engine was in operation. Fifth hour, valve rocker arm bolts loose on cylinders Nos. 3 and 4; broke valve rod yoke on No. 3 cylinder at 11:20; this was replaced during first shift of hose at 12:30. Ninth hour, inlet valve springs on Nos. 1 and 2 cylinders broken just before 3:45.

No. 1—Seagrave pumping engine, rated at 1000 gallons at 120 pounds pressure, 500 at 200, and 300 at 250. Net weight, without men or hose, 16,370 pounds; tires, solid, five-inch single forward, four-inch dual rear; tread, 68 inches; wheelbase, 14 feet four inches. Engine, own make, six-cylinder, 7.75-inch bore, nine-inch stroke, 144 horsepower. Gear ratio, engine to pump, 1:3.6. Centrifugal pump, three-stage, 11-inch impeller. One gasoline tank, 60 gallons. Height of pump from ground, 43 inches.

No. 2—Ahrens-Fox pumper with hose body, rated at 700 gallons at 120 pounds, 350 at 200 and 330 at 250. Net weight, 14,520 pounds; tires, solid, six-inch single forward, four-inch dual rear; tread, 66 inches; wheelbase, 12 feet four inches. Engine, Herschel-Spillman, built to plans of Ahrens-Fox Fire Engine Company, six-cylinder, 5.75-inch bore, 6.5-inch stroke; 79.3 horsepower. Gear ratio, engine to pump, 3.11:1 and 4.33:1. Pump, two-cylinder, double-acting, steamer type; 6.5-inch bore, four-inch stroke. One gasoline tank, 45 gallons. Height of pump above ground, 45 inches.

No. 3—American-La France, triple combination, rated at 700 gallons at 120 pounds, 350 at 200 and 325 at 250. Net weight, 8925 pounds; rear wheels, 5395 pounds; tires, Dayton airless, 4.5-inch single forward, 4.5-inch dual rear; tread, 62 inches; wheelbase, 13 feet two inches. Engine, own make, six-cylinder, 5.5-inch bore, six-inch stroke, 72.6 horsepower. Gear ratio, engine to pump, 1.66:1 and 3:1. Pump, rotary gear; displacement, 1.25 gallons a revolution. Two gasoline tanks, 11 and 28 gallons. Height of suction, 33 inches.

No. 4—Luitwieler, combination pumping engine and hose wagon, rated at 600 gallons at 120 pounds, 300 at 200 and 200 at 250. Net weight, 10,200 pounds; rear wheels, 6200 pounds; tires, solid, four-inch single forward, five-inch single rear; tread, 58 inches; wheelbase, 11 feet seven inches. Engine, Trebert, four-cylinder, six-inch bore, 6.5-inch stroke, 57.6 horsepower. Gear ratio, engine to pump, 11.78:1, 24.79:1 and 36.14:1. Pump, three-cylinder, double-acting, six-inch bore, 12-inch stroke, displacement, 8.581 gallons a revolution. One gasoline tank, 30 gallons. Height of suction, 25 inches.

No. 5—American-La France combination pumping engine and hose wagon, rated at 1400 gallons at 120 pounds, 700 at 200 and 640 at 250. Net weight, 12,770 pounds; rear wheels, 6760 pounds; tires, solid, five-inch single forward, five-inch dual rear; tread, 63 inches; wheelbase, 14 feet six inches. Engine, own make, six-cylinder, 7.125-inch bore, eight-inch stroke, 126.2 horsepower. Gear ratio, engine to pump, 2.15:1 and 4:1. Pump, rotary gear;

Grand total discharge.....392,320

Second hour, water from radiator cap was blown by fan against spark plug, so belt was taken off. Fourth hour, No. 6 cylinder missing at 9:50; operator said cylinder was cracked; occasionally No. 6 cylinder would operate. Seventh hour, No. 2 inlet and No. 6 exhaust valve springs broken. Eighth hour, 2:00, No. 6 inlet valve spring broken. Ninth hour, 2:25 till time of shut down (4:57) plunger packing leaked. Tenth hour, engine shut down at 4:57 account pump trouble, caused by leaky valves.

Grand total discharge.....364,440

First hour, engine varying in speed, missing occasionally; carburetor popping, due probably to air in gasoline line; settled down to good action in about two hours.

displacement, four gallons a revolution. Two gasoline tanks, 28 and 15 gallons. Height of suction, 36 inches.

No. 6—Knox combination pumping engine and hose wagon, rated at 600 gallons at 140 pounds, 400 at 200 and 325 at 250. Net weight, 14,010 pounds; rear wheels, 7330; tires, solid, five-inch single forward, five-inch dual rear; tread, 70 inches; wheelbase, 14 feet four inches. Engine, own make, six-cylinder, five-inch bore, six-inch stroke, 60 horsepower. Gear ratio, engine to pump, 6.47:1 and 3.77:1. Pump, two-cylinder, double-acting; five-inch bore, eight-inch stroke. One gasoline tank, 30 gallons. Height of suction, 32.5 inches.

No. 7—Nott combination pumping engine and hose wagon, rated at 600 gallons at 120 pounds, 300 at 200 and 250 at 250. Net weight, 12,300 pounds; rear wheels, 6800 pounds; tires, solid, five-inch single forward, six-inch rear; tread, 71 inches; wheelbase, 11 feet 8.5 inches. Engine, own make, four-cylinder, 6.5-inch bore, eight-inch stroke, 67.6 horsepower. Gear ratio, engine to pump, 1.2:1. Pump, rotary roller, dual or single-acting; displacement, .98 gallon a revolution. One gasoline tank, 40 gallons. Height of suction, 46.5 inches.

No. 8—Robinson, combination pumping engine and hose wagon, rated at 750 gallons at 120 pounds, 400 at 200 and 300 at 250. Net weight, 11,600 pounds; rear wheels, 6160 pounds; tires, solid, five-inch single forward, six-inch single rear; tread, 60.5 inches; wheelbase, 14 feet four inches. Engine, Buffalo Gasoline Motor Company's, six-cylinder, 6.25-inch bore, 6.75-inch stroke, 93.7 horsepower. Gear ratio, engine to pump, 3:1. Pump, three-cylinder, single-acting; six-inch bore, eight-inch stroke; displacement, 2.938 gallons a revolution. One gasoline tank, 30 gallons. Height of suction, 39.5 inches.

No. 9—Nott combination pumping engine and hose wagon, rated at 800 gallons at 120 pounds, 400 at 200 and 360 at 250. Net weight, 14,360 pounds; rear wheels, 8150 pounds; tires, solid, six-inch single forward, five-inch dual rear; tread, 71 inches; wheelbase, 11 feet 8.5 inches. Engine, own make, six-cylinder, 6.5-inch bore, eight-inch stroke, 101.4 horsepower. Gear ratio, engine to pump, 1.3:1. Pump, rotary roller, dual or single-acting; displacement, 2.63 gallons a revolution. One gasoline tank, 40 gallons. Height of suction, 46.5 inches.

No. 10—Robinson combination pumping engine and hose wagon, rated at 900 gallons at 120 pounds, 500 at 200 and 350 at 250. Net weight, 11,150 pounds; rear wheels, 5890 pounds; tires, solid, five-inch single forward, six-inch single rear; tread, 60 inches; wheelbase, 14 feet five inches. Engine, Buffalo Gasoline Motor Company's,

six-cylinder, 6.25-inch bore, 6.75-inch stroke, 93.7 horsepower. Gear ratio, engine to pump, 2.5:1 and 3.75:1. Pump, three-cylinder, single-acting, six-inch bore, eight-inch stroke; displacement, 2.938 gallons a revolution. One gasoline tank, 30 gallons. Height of suction, 37.75 inches.

No. 11—Waterous combination pumping engine and hose wagon, rated at 700 gallons at 120 pounds, 350 at 200 and 300 at 250. Net weight, 13,830 pounds; rear wheels, 9060 pounds; tires, solid, five-inch single forward, four-inch dual rear; tread, 69 inches; wheelbase, 11 feet four inches. Engine, own make, six-cylinder, 6.5-inch bore, seven-inch stroke, 101.4 horsepower. Gear ratio, engine to pump, 2.23:1. Pump, four-cylinder, single-acting, 4.75-inch bore, eight-inch stroke; displacement, 2.455 gallons a revolution. Two gasoline tanks, 20 gallons. Height of suction, 23.25 inches.

At the conclusion of the test the motors were inspected, all the bearings, pistons, cylinders, valves, etc., being found to be in good condition except the following: No. 4, no inspection, as machine was withdrawn from the test; 7, gasket leaks on No. 2 cylinder, nut gone from one valve

The following tabulation shows the total time each machine was in service, the maximum and minimum suction lift and the amount of gasoline used:

| No. | Time |       | Max. Lift |     | Min. Lift |     | Fuel Gals. |
|-----|------|-------|-----------|-----|-----------|-----|------------|
|     | Hrs. | Mins. | Ft.       | In. | Ft.       | In. |            |

During the week several papers were read by members of the association, many of them having to do with subjects intimately connected with

the work of the fireman, and insurance. Motorized equipment was discussed in three of these papers, extracts from which appear in succeeding pages.

The election of officers for the ensuing year resulted as follows: President, Thomas Hanley, Jacksonville, Fla.; first vice president, Hugo Lelphs, Lansing, Mich.; second vice president, Harry L. Marston, Brockton, Mass.; secretary, James McFall, Roanoke, Va.;

treasurer, George Knofflock, Mansfield, O. This action means that the two first named were each promoted one step, and that the last two were re-elected, Chief Marston being the only new member of the official board. The convention was a decided success in every respect, and the results obtained by the tests will mean much to the automobile industry. The 1914 convention will be held in New Orleans.

The Waterous Pumping Engine, One of the Three Which Worked the Full 12 Hours.

rocker arm bolt; 8, Nos. 2 and 3 connecting rods each had loose check nuts on cap bolts, could not come off on account of cotter pins ("holding" nuts tight); 9, one valve rocker arm bolt broken, three valve rocker arm bolts loose, nuts and washers missing, two inlet valve springs broken; 10, leak from water jacket into No. 6 cylinder, allowing water to enter cylinder and crankcase; three valve springs broken.

**Cooper and the Stutz Again**—A dispatch from Corona, Cal., says that Earl Cooper in a Stutz car finished first in the medium car race, 251.97 miles, and the free-for-all, 301.81 miles, at the opening of the motordrome in that city, Sept. 9. His time for the first event was 3:21:29.2, and for the second, 4:02:38.

While practising for the automobile races at Jackson, Mich., Harry Endicott, brother of William Endicott, and one of the best known racing drivers in the country, was instantly killed, Sept. 5. It is understood that Endicott was at the wheel of a powerful 100 horsepower Cutting machine.

## BRITISH MOTOR FIRE-FIGHTING ENGINES.

(Extract from paper read by Divisional Chief Arthur Reginald Dyer, London, England, at the convention of the International Association of Fire Engineers in New York City.)

Before entering on the subject of motor fire appliances, a brief explanation of the system adopted in London of dispatching appliances in response to calls is subjoined, in order that the conference may understand the duties required from the various types adopted.

The area to be protected is 117 square miles, which, with the exception of the public parks and some small areas at the extremities of the Metropolis, is entirely covered with buildings. There are at present for this area 85 land fire stations and three floating stations; of the former 18 are entirely equipped with motors and 12 partially so.

Each station is equipped with a fire escape van carrying a ladder capable of being extended to at least 50 feet and also furnished with supplementary ladders, hose and tools for getting to work from hydrants, and a cylinder holding about 30 gallons of water, fitted with 180 feet of rubber garden hose .75 inch inside diameter, for extinguishing small fires. This appliance, the crew of which is on duty night and day, is ready for an instantaneous turn-out and only attends fires on the ground immediately protected by the station; the distance it may travel to fires rarely exceeds one mile. The yearly mileage of escape vans is about 600 a machine.

Most stations are also equipped with an engine or motor pump, and in a few localities with two engines, all of which carry hose, etc.; these engines besides attending fires in the vicinity of the stations at which they are kept, are considered available for service at any fire in the area protected. The yearly mileage may be taken at 1200 a machine, but in addition they perform heavy duty pumping at fires sometimes for 24 hours without intermission.

Stations in localities where there are many high or warehouse buildings, are equipped with long ladders extending from 75 to 90 feet. These appliances, while intended generally speaking for attending local calls, are considered available in case of serious fires in high buildings within a radius of about five miles. The yearly mileage run does not exceed 1000 a machine.

Other motor appliances in use are lorries (trucks) for carrying on from the central stations, coal and oil fuel for the steam fire engines, petrol (gasoline) for motor pumps, and also additional hose and acetylene water lights, etc., to large fires, and delivering stores regularly to stations; tenders for taking on the principal officers and their orderlies to fires, and also self-contained oxygen smoke helmets, cellar pipes, marine torches (acetylene), etc.; instruction tenders for training the men undergoing instruction in motor driving. These are not the oldest motor appliances available, but modern ones with chassis similar to those in use for pumps, escape vans, etc.

Motor cars for officers have been in use since 1901 and shortly after that an attempt was made to draw an existing land steam fire engine by a motor tractor, the front axle being removed, making altogether a six-wheeled appliance. It was found impossible, however, to travel at sufficiently high speeds with this without undue skid-

ding and the principle was abandoned.

In 1902 an existing steam fire engine was converted to a motor engine by providing a separate engine for propulsion, the steam being supplied by the fire engine boiler; after a time, however, this was abandoned and the appliance was reconstructed for horse traction.

The first success in replacing horsed fire engines and horsed escape vans by mechanically driven vehicles occurred in 1905-1906, when steam motor fire engines and petrol motor escape vans were obtained. With the former it was found that as the appliance had to be ready for an immediate turn-out, a pressure from 80 to 100 pounds a square inch had to be maintained in the boiler, and owing to the excessive vibration on this type of boiler on the road necessitating considerable repairs, and also to the large expense incurred in maintaining this pressure by gas, the steam system was abandoned.

With regard to the petrol motor escape vans the first supplied only gave moderate satisfaction as manufacturers generally had no experience in the running of motors (weighing about 11,200 pounds with load) at speeds exceeding 20 miles an hour to guide them, the principal defects being under-tiring, want of sufficient strength in

Chief Kenlon of New York City inspecting the Seagrave during the pumping test.

the fittings to withstand the excessive vibration, and inadequate springing, indeed prior to 1910 it was considered necessary to have one spare escape van for every one on duty in order to maintain an efficient service, whereas at present only one in five motor escape vans or motor pumps is necessary. The experience with early petrol fire engines fitted with pumps was somewhat similar.

From the first introduction of heavy engines capable of high speed the problem of providing a satisfactory non-skid engaged attention. Some mitigation of the inconvenience was found by utilizing chains festooned diagonally across the tires, but considerable damage was caused to the rubber, which when worn, allowed the chains to come in contact with the iron rims, causing the non-skid chains to break and not unfrequently jam in the driving chains, or to allow the loose ends to tear the mudguards, etc. Other devices were tried to check the tendency to skid, such as studded leather covers and transverse bands of steel studded balata belting fitted into slots cut into the rubber of the tire. The latter were found to be most effective when tires and bands were new, but gave endless trouble when partly worn.

One motor pump was fitted experimentally with a gyroscope behind the radiator, but it was removed as a swaying motion was set up when travelling at high

speeds. In addition to this the steering was rendered uncertain.

One appliance has run for a year without non-skids, but with soft rubber tires of flat tread and extra wide section, single on front wheels, twin on hind wheels; although no skidding has taken place there is still some doubt if fire engines can be safely run under all conditions in London without some non-skid attachment.

Front wheel brakes were tried on the appliances supplied by different manufacturers in 1910 in order (it was hoped) to obviate the effects of skidding, but whilst satisfactory results were obtained on tests they were found unsuitable in practise and have now been removed from the appliances and rear wheel or differential brakes fitted in lieu.

The difficulties formerly experienced have now been fairly overcome as follows: (a) by careful training and the continued experience of drivers; (b) by allowing greater cross section in tires; (c) by extra heavy leather steel-studded covers fitted on two wheels only, one front wheel, one hind wheel.

#### Escape Vans.

The author has up to now referred only to the early attempts to introduce motor traction in the place of horses and the experience gained was extremely valuable both to the fire brigade officials and the manufacturers. It is now proposed to deal only with what may be termed

eight fully laden, at a speed of about six mph or a moderate gradient at 15 mph.

The weight of the appliance fully laden is about 600 pounds more than a corresponding petrol van. Undoubtedly petrol motor escape vans are required for localities where stiff gradients have to be encountered.

The type found satisfactory has the following general features: Four-cylinder engine, five-inch bore by 5.5-inch stroke, giving about 50 brake horsepower; double ignition, Bosch magneto and accumulator and coil; speed about 30 miles an hour.

The engine is started up in the station every four hours, day and night. Where the engine room at the station is not warmed with hot water or gas radiators, electric heaters are hung over the front of the radiator to warm the engine and keep it ready for an immediate start in cold weather.

The appliance weighs about 11,200 pounds fully laden and has 4.5-inch tires on front wheels and 5.5-inch on rear.

#### Pumps.

A modern petrol pump used in the London fire brigade has a four-cylinder engine, five-inch bore and 7.125-inch stroke, giving 58 bhp at 1000 rpm and 65 bhp at 1100 rpm. Speed, 30-40 mph. Weight about 11,200 pounds fully laden with men, gear and hose. Tires are single, 4.5-inch front and single, 5.5-inch rear. The pump is centrifugal (usually termed turbine) and geared up from the engine. It is placed at the rear of the appliance and can be controlled from there or from the driver's seat.

It is now found that for London the two, three or four-stage centrifugal pump is capable of fulfilling all the required conditions and only this type has latterly been specified. The pump gives an output of 500 English gallons (American, 600 gallons,) a minute at a working pressure of over 120 pounds square inch.

There is a considerable controversy among fire engineers in Great Britain as to whether the reciprocating or centrifugal pump is the most suitable for the duty required of fire engines. The mechanical efficiency of the reciprocating pump is 10 to

15 per cent. higher than the centrifugal; the pump can run slower when discharging a small quantity of water at high pressure and can pick up its own water when drawing from a canal or dock without the aid of a vacuum pump, which is necessary for the latter.

The centrifugal pump has to run fast in order to obtain even a small quantity at high pressure. On the other hand when delivering at lower pressures a larger volume can be delivered than from the reciprocating.

One great advantage of the centrifugal pump is the possibility of working two pumps in series when a high pressure is required, or in parallel when a large volume is required for one jet. Under the former conditions an efficient jet was thrown over the top of St. Paul's Cathedral 340 feet above pavement level. The jets commonly obtained from standard large sized American steam fire engines can also be obtained by working two of the smaller capacity motor pumps as described above.

In London it is necessary that in addition to the pump at least 600 feet of rubber lined canvas hose 2.75 inches inside diameter, besides the necessary small gear and five men, be carried. The speed of the appliance is greater than that of motor escape vans.

Although at present in the outlying suburban stations smaller horsed steam fire engines are stationed than those in the central area stations where the fire risk is greater, it has been found best to equip the former sta-

The Ahrens-Fox, Concerning the Work of Which No Criticism Was Offered.

motor appliances at present in use.

Perhaps the most successful type of appliance to be introduced has been the electric motor escape van, for service in localities where only moderate gradients are encountered, the first of this kind being obtained in 1911.

The power is provided by a battery of 84 cells of 195 ampere-hours capacity, giving a normal running output of about 30 horsepower. The appliance runs about 30 miles on one charge if necessary, but owing to the nature of its service it stands fully charged ready to give out the maximum output on receipt of a call.

The motors are in the front wheels, the fields being fixed to the stub axle around which the armature revolves with the wheel. The tires are single five-inch on all wheels.

There are electric brakes on the front wheel motors which are valuable in emergencies, while two mechanical brakes on the rear wheels are sufficient under ordinary circumstances. The control is of the series-parallel type with five notches forward and reverse, and two brake positions.

The weight of the appliance ready for running, but without ladders, hose and small gear and men, does not exceed 8300 pounds, the total weight of the machine complete being 11,800 pounds. A speed of 25 miles an hour is maintained with full load on a level and good road, and the machine is capable of ascending a gradient of one in

tions with the same sized motor pump as in use elsewhere, as the additional pumping capacity is available when an engine is ordered on to large fires, also the additional distance to be covered need not be considered as in the case of horsed engines.

#### Turntable Long Ladders.

At present the brigade is only equipped with two motor turntable long ladders. These can be extended to a height of 90 feet and can be safely used as a water tower at a height of 60 feet. In both cases the system of propulsion is by electric storage batteries and hub motors in the wheels. In one design the wheel motors are interchangeable with those on the motor vans for carrying escapes and drive on the front wheels. In another type the battery is of the same capacity and manufacture, but the motors are fitted to the rear wheels.

It is not considered necessary to specify for these appliances to travel at a speed of more than 20 mph. The total weight of the appliance with ladders is about 13,800 pounds. It is probable that by adopting motor long ladders a number of the existing horsed long ladders will be dispensed with, two of which are being adapted for electric traction.

#### Lorries.

The first lorry to be procured was a standard five-ton (11,200 pounds) machine from one of the largest lorry builders. It is fitted with a four-cylinder engine, 5.5-inch bore and 6.5-inch stroke, having an output of 55 bhp at 1000 rpm, and is capable of a speed of 30 mph. It is fitted with five-inch tires on front wheels and twin five-inch on rear; no non-skids are provided. A covered hood is fixed.

A second lorry has been ordered. This will be one of the standard three-ton (6720 pounds) type, similar in most respects to the larger machine. It will have a four-cylinder engine, 4.75-inch bore and five-inch stroke, giving an output of 45 bhp at 1000 rpm. This machine will be kept at the chief station in one of the districts and will be used in a similar manner to the other appliance.

#### Motor Tenders.

Those at present in use for carrying principal officers to fires and other work are standard chassis by well known makers. In one case large pneumatic tires 35.5 by 5.5 inches (895x135 mm) are fitted, with detachable rims. On this machine four men are carried besides the gear mentioned previously, the total weight being 4410 pounds, and no trouble has been experienced with the pneumatic tires. Indeed the instruction tender, which is of similar pattern and drive, has also been recently adapted for pneumatic tires instead of solid ones.

At some suburban stations motor tenders are allocated in addition to the motor escape van that in the event of the latter being required elsewhere the tender may be at once dispatched with sufficient men, hose, hook ladders, etc.

#### Motor Cars.

The cars in use, of which there are 13, are of standard pattern by well known makers, and are mostly fitted as touring cars. They are used both for inspection work and also for proceeding to fires. The superintendents in each of the six districts are now provided with two-seater touring cars for daily inspection of the stations in their districts, also for taking them on to fires. Smoke helmets are carried in those cars.

## MOTOR APPARATUS; ITS DURABILITY, ETC.

(Extract from paper read by Chief A. V. Bennett, Birmingham, Ala., at the convention of the International Association of Fire Engineers in New York City.)

The desperate rivalry existing between our cities and their mad race to excel their neighbor in population, has prompted the extension of the corporate limits from time to time so as to include vast tracts of sparsely settled territory. This, together with the automobile and the trolley car, has introduced a new condition, and developed new difficulties for those who were charged with the duty of furnishing fire protection.

The automobile has enabled the man of wealth to establish a home in the outlying districts, where he may enjoy the comforts of country life and still be near the scene of his daily activity. The trolley car has made it possible for the man of moderate means to establish himself in the suburbs, where he and his family can live in surroundings that would cost him twice as much were his home in the heart of the city.

The country and suburban movements have grown to tremendous proportions during the past few years, and at the present time we are experiencing the heyday of their popularity. The people who have become commuters and still reside in the city are as much entitled to fire protection as those who reside in the heart of the congested district. In an effort to meet these new conditions, even those municipalities that were erecting new fire stations, and providing additional men and equipment each year, still found themselves confronted with vast expanses of territory that was too far to be reached in time to render efficient service with the horse drawn machine.

To provide means of transporting men and appliances over larger areas fast enough to do successful fire fighting; to provide efficient fire protection for vast stretches of sparsely settled territory, was a problem that again called into service the inventive genius, who, after years of earnest effort, hardship and disappointment, and the expenditure of huge sums of money by the manufacturer, has at last succeeded in giving us the modern, efficient and reliable self-propelled fire apparatus.

The motorizing of a fire department, however, like all radical changes from an established custom, is fraught with many difficulties, and means far more than merely consigning the faithful fire horse to green pastures, and substituting the tireless machine to perform his duty. One of the first, and perhaps the greatest problems with which you are confronted, is the proper training of men to operate the machines successfully. This is especially

true of cities that are too small, or for other reasons, are unable to establish and maintain regular training schools.

To the average citizen, who sees our streets thronged with automobiles driven by women and children and irresponsible men, the driving of a piece of motor fire apparatus to a fire is an act of small consequence, and requires little ability or training. Such, however, is not the case, as is evidenced by the many accidents, fatal and otherwise, that have occurred throughout our country since the introduction of the motor machine.

In the first place, your motor fire apparatus driver is a fireman, animated by all the enthusiasm that permeates the profession. This prompts the desire to reach the scene of fire at the earliest possible moment, that he and his company may give the best account of themselves in the fight which is to be made. This enthusiasm, which, of course, must not be destroyed, has a tendency to recklessness and the reckless driving of a heavy piece of motor fire apparatus through crowded streets is dangerous to the public, and ruinous to the machine and sooner or later results disastrously.

After you have succeeded in training a member of your department to be a careful and successful driver of your motor machine, you have taught him a new trade, and his services are immediately in demand by owners of commercial vehicles, who are in position to pay better salaries or to offer shorter hours, with the result that your best men are often lost to your department when their services are most valuable.

The useless racing of the engine while the car is standing; the engaging of the clutch with the engine racing in starting the car, causing extreme and unnecessary strain on every part of the apparatus, even to twisting the frame work; the engaging of the transmission gears before the clutch has ceased to revolve, and the engaging of the reverse gear while the car is in forward motion; the too rapid driving of the machine to the immediate scene of the fire, or to quarters on returning, necessitating the too rigid application of brakes, subjecting the car to useless strain and costly repairs to wheels and tires; the reckless driving of the machine around street corners, causing unnecessary strain on all the parts, inducing skidding and resulting in many unnecessary accidents; fast driving over cobblestones, grade crossings and rough streets, which tends to crystallize axles, steering knuckles, etc., are a few of the things that your inexperienced driver is apt to do. In the motorizing of your fire department, many other problems are to be solved, but the durability, efficiency and economy of operation of your machine depend almost entirely

on the care, judgment and skill of the driver in the handling of the car.

#### **Durability.**

The durability of the motor machine, if properly handled, should be almost indefinite, since its radius of action is comparatively small, and its mileage a year in many instances less than 100 miles, and in very few cases exceeding 500 miles. In the majority of alarms answered the entire distance to and from the fire is over paved or well kept streets, which reduces the wear and tear of the machine to a minimum.

#### **Efficiency.**

The motor's chief claims to efficiency is its speed and ability to continue indefinitely without tiring. By its speed we are enabled to extend its radius of action over a territory two or three times as great as that covered by the horse drawn machine and still obtain efficient fire service.

We have, on several occasions, covered a distance of three or four miles with our motor machines, and extinguished fires with small damage, originating in ordinary frame residences. Of course, this does not mean that the number of companies or the number of men employed before the installation of the motor should be reduced, for in the handling of large fires, in your congested district, you will unquestionably require the services of as many men and as many pieces of apparatus as formerly.

**The Two Nott Engines, Six-Cylinder in Front and Four in the Rear.**

Nor does the motorizing of your department mean that you will only be required to establish engine houses in a radius of three or four miles of each other in your densely populated residence section. But it should mean more efficient service in all sections of your city and that engine houses will not be required in the immediate vicinity in order to furnish protection to your sparsely settled territory.

The motor machine perhaps in no way more clearly demonstrates its efficiency than in the prompt manner in which second alarm companies reach the scene of the fire. This is especially true in the residential sections of the smaller cities, where second alarm companies have a great distance to traverse. Their prompt arrival on the scene is always a source of gratification to the officer in charge.

#### **Reliability.**

The reliability of motor apparatus has been a question of grave concern among fire department officials and others interested in fire protection. Such questions, as, Will the motor negotiate steep hills? or muddy streets? or deep sand? soft and hard snow? have been the subject of much correspondence between officials whose cities had already bought, and those who were contemplating buying the modern equipment.

By actual tests, the motor has proven to be as free from break-downs and delays, if properly handled, as the

horse drawn machine, and should be considered equally as reliable and trustworthy under all circumstances. In negotiating hills, your motor will climb grades with comparative ease that it is impossible to ascend with the horse drawn machine. In muddy streets, through sand or snow, if your motor machine can get traction it will plow through bad stretches that with one pair of horses hauling your heavy fire apparatus would be sure to fail.

#### **Economy of Operation.**

The cost of operating motor fire apparatus is rather difficult to determine accurately as yet, because of the uncertainty of depreciation and necessary repairs due to actual wear and tear. The expense of operation, however, is largely controlled by the ability and care of the driver in handling your machine, who will raise the cost to abnormal proportions, or lower it decidedly below that of the horse drawn machine doing the same work, proportionately, as he exercises skill and judgment in his driving.

Tire equipment will necessarily be one of the factors in the cost of operation. The pneumatic tire possesses many advantages, such as resiliency and traction; is less liable to skid and protects the machine against rough driving, but the ever present danger of a puncture or blow-out, often putting the machine out of commission to change or repair tires, and the expense of frequent replacements renders the pneumatic far from being the

ideal tire. The solid tire too has its advantages and disadvantages. The danger of punctures and blow-outs is entirely eliminated, and this equipment is durable and thoroughly reliable. With dual tires on the rear wheels, sufficient traction is obtained to carry the machine where you might reasonably expect to go, but the vibration to which your machine is subjected while being rapidly driven, especially over rough streets, necessitates many repairs and sooner or later sends the car to the shop for a general overhauling.

The cushion tire combines many of the good qualities of both the pneumatic and the solid, but does not possess the durability of the latter, and is correspondingly more expensive.

The actual cost of operating motor apparatus, exclusive of wear and tear and depreciation, is very small as compared with the horse-drawn machine. We have cars in service on which the cost of operation has averaged less than \$3 per month since their installation, which was nearly three years ago. We also have machines in service which during the last 18 months have not required one penny's worth of repairs.

The march of progress cannot be halted. Self-propelled fire apparatus, as the product of this progress, is rapidly making mighty inroads on the old methods of the fire fighting service. The growing favor of the motor car is in no way more concretely illustrated than in the recital of the fact that my home city, Birmingham, Ala., less than three years ago, with its 24 pieces of motor driven fire apparatus, ranked first as far as equipment of this kind in relation to population was concerned. But, today, what a change! With the same number of pieces in service she has dropped down to 36th.

This wonderful increase in the use of the new equipment is not due to a mere desire to get in line, to be more modern than our neighbor cities, but to far more substantial reasons. It has been brought about because it is more economical; because it is more sanitary; because immediately after our longest, hardest runs, it is ready to respond to the next call; because it will continue indefinitely without tiring.

## THE GASOLINE MOTOR PUMPING ENGINE.

(Extract from paper read by Charles S. Demarest, chief of construction, New York Fire Department, at the convention of the International Association of Fire Engineers in New York City.)

The motor pumping engine is yet a broad subject for discussion, but when we consider the standards set for it by the steam fire engine, which required a period of 60 years to bring it to its present state of perfection, we must all agree that the development of the motor pumping engine in the past two or three years has been wonderful. The New York department has so few pieces of motor pumping apparatus that actual service conditions will not be discussed to any large extent; however, experience with the large amount of other motor fire apparatus, and the rigid inspection of motor pumping engines made while taking part in tests of about every make on the market, have convinced the writer that the motor pumping engine cannot be classed, with its present design, as giving the same reliability as the steamer, although its performances in most every other respect have about equalled that of the steamer for the period of time during which they were run. We are all familiar with the performances and reliability of the steamer, and there is no reason in my mind why the motor pumping engine should not be just as reliable for fire service if the manufacturer would make a more exhaustive study of the conditions that actually exist at fires.

A motor behaves well in clear weather and many behave well on the road in a severe rain storm, but it has been our experience with several pieces of apparatus that they could not continue in service under conditions of rain and water liable to be encountered in fire service. Even with pleasure vehicles trouble is encountered; on July 28 of this year we had a severe rain storm which lasted for about one hour; during that storm, between 59th and 115th street, there were six automobiles that were stalled, due to the ignition systems not being water proof or not being properly protected against a severe rain storm.

It is not an unusual condition in fire service to have eight to 25 engines at work, with hose lines running on all sides and probably underneath fire apparatus; a burst hose near a pumping engine, a deflected stream from a nozzle or heavy spray may completely drench a motor. Now, is the motor pumping engine, its magneto, ignition system and carburetor, so well housed that it will continue to perform under such conditions? There is no reason why these important parts of the motor cannot be so housed that the chances of the motor going out of commission are very remote when hit with a stream of water. It may be possible that a motor must have a certain amount of air current while running on the road, but this does not apply when the motor is pumping water, as all motor pumping engines are so constructed that you may regulate the cooling water from the fire pumps.

Recently the motor for a water tower could not be started after several hours service at a fire; on investigation it was found the spark coil, one of the best on the market, had got wet and would not operate; the water in this case had worked through the front, indicating the need of not only water proofing all parts of the spark coil, but of housing the front in such a way that water

cannot reach it. If this had been a motor pumping engine it would have been put out of service, probably at the most critical stage of the fire.

Water proof magnetos are on the market, but do we get them on fire apparatus? Very few of the present makes are equipped with them, yet we learn of pumping engines failing at test because of water from leaky radiators being sprayed on them, and we know severe rains will put them out of service. Spark plugs, heated by long runs, have been known to have the porcelain insulation so badly cracked by water as to short circuit. The effect of water blowing into the carburetor would be serious, but no effort has been made to eliminate the danger and many are set in such a way as to invite water. It has been argued that because of the hood, the probability of water getting to these parts is very small. This cannot be accepted as a satisfactory statement with the present apparatus on the market; there is not today any motor pumping engine which can run for several hours without having to lift the hood to oil some moving part or refill an oil tank. In addition to having the above parts completely water proof, why should we not have

The Two Robinson Pumping Engines; Monarch in Front and Jumbo in Rear.

all other parts so designed as not to have the cover touched during a long run? The carburetor for fire service should have very few adjustments and these adjustments should not become disarranged or have to be changed after properly adjusting. The oiling system should be so designed and located that it would not be necessary to raise the engine hood for oiling purposes while working at a fire.

From the repair standpoint there should be borne in mind three very important factors: No apparatus should be bought which is too complicated for the chauffeur to make minor repairs, or for the foreman of the repair shops to take to pieces and put back again; no apparatus should be purchased which is so built that it is hard to get at its parts and requires a partial or total disassembling to make most repairs, and no machine should be constructed with its parts so heavy that they cannot be readily handled.

That these three features are not always followed is evident to anyone having to do with the repairing of many of those on the market. The cost of repairs in many cases is excessive, due to unnecessary complications. For example, in some apparatus it is necessary to take down the entire transmission and jackshaft housing in order to replace a jackshaft, but if the jackshaft were of the full floating type all this unnecessary labor

would be eliminated; in certain types, in order to get at the timing gears the entire motor has to be taken out; to put in a gasket on the exhaust manifold it should not be necessary to take down the steering column and dash; this is faulty construction and should be eliminated. A unit power plant is preferable, as it is not as liable to get out of line and is easier to handle when making repairs, as it can be taken out as a whole or can be taken apart.

The starting dog on the crankshaft should be keyed on as well as fastened with a pin; the shearing off of the pin, which has occurred in several cases where that was the only fastening, has resulted in serious injury to the timing gear.

Drip pans should be made more readily removable; in many instances it takes an hour or more to remove this when some minor repair is necessary.

The method of transmitting power from the motor to the pump should be positive in its action and there should be no chance of slippage between the motor and pump when increased pressures are required. Some recent accidents seem to indicate that the driver has gone from full speed ahead direct to reverse; this should not be possible, and usually a simple stop of some kind can be attached without changing the design of the shift.

The multiple disc clutch is unsatisfactory because of

the gasoline tank should be made of copper and of sufficient capacity to run the engine at full capacity for four or five hours, and gasoline supply to carburetor should be by the gravity system so the tank can be replenished without interrupting the motor. There should be no soldered joints in the gasoline line and this line should have a shut off close to tank and easily accessible, as well as a drain valve; the gasoline tank on pumping engines should have an arrangement whereby the operator can observe at all times the amount of gasoline in the tank.

The question of combined gasoline-electric drive is approached with limitation, as the manufacturers have gone to large expense in getting up this type of apparatus, presumably to meet the demands of fire chiefs. However, it is the writer's opinion that it is not the logical development and is certainly not desirable for the smaller places, where extensive shop facilities are not available and an electrician cannot be maintained. Besides increasing the first cost to a figure much beyond that for a tractor drawn piece of apparatus, it introduces the complications of extensive electric wiring; few men attached to repair shops can properly care for such apparatus and it is very unlikely that the operator will know even the first principles of maintenance of such apparatus.

As a broad statement, resulting from experience with

all types of motor apparatus for fire service, it is evident that if the manufacturers do not pay more attention to their design as affecting reliability and ease of repair, it will be necessary for the fire chiefs to draw up more rigid specifications and detail drawings, which will require the manufacturers to modify their stock plans.

In buying motor fire apparatus a city, particularly a small or moderate one, should stick to one make that will give the desired results, or at any rate adopt certain things to be standardized and make all bidders put those things on according to your standard. If tractors are bought, they should be required to be interchangeable, the bolted connection, turntable, or whatever is used, to be the same in each. There is no reason why wheels,

axles, springs, brakes, carburetors, magnetos, batteries and spark plugs should not be standardized, thus cutting down the extra parts necessary to carry and make it easier to repair the apparatus; this will usually mean the employment of a mechanical draftsman to draw plans of these things, to be inserted in the specifications, but every up-to-date repair shop should have such a man, or should be able to employ one from the outside for the time needed. For the larger shops a graduate mechanical engineer, with about five years' experience, is almost a necessity; in our budget for next year we have asked for the creating of this position.

Continuing its policy of co-operating with the owner, the Willys-Overland Company, Toledo, O., maker of the Overland automobiles, has issued its annual book containing directions for the operation, care and adjustment of the new model 70, which is described in this issue. The book is considerably larger than its predecessor, which dealt with two models, and includes instructions as to the care of the electric lighting and motor starting system. Each component of the chassis is carefully explained and illustrated, and the directions for making adjustments are complete in each detail. The brochure appears in a durable dark green cover and the contents are indexed. One of the valuable features of the book is the lubrication chart.

The Smaller of the Two American-La France Machines in the Test.

the necessity of oiling and oiling just right; the cars so equipped in this department have given a great deal of trouble from these clutches being too dry and the gears being stripped when a change of speed was attempted. To oil and fix this type of clutch usually means putting the car out of service for quite a time and requires the removal of all hose on the apparatus. Although very satisfactory for touring car service, for fire service it should never be used.

Are the steering knuckles, cross steering tubes and their connections made of the best material and of sufficient strength to withstand fire service? With several makes of apparatus they have failed while responding to fires, and this failure is too serious to occur under even very severe conditions; the apparatus is out of service and probably sustains considerable damage, and, more important, the lives of the men are jeopardized. The wheel spindles, steering knuckles, cross steering tubes and their connections to the steering wheel should be stronger than on commercial apparatus, as the road conditions are more severe.

A heavy bumper should be provided on all fire apparatus, and it will more than pay for itself within a short time.

Besides the above, a study of accidents and repairs has brought out the following:

The oiling systems should be positive and reliable;

## GENERAL NEWS OF THE INDUSTRY.

### Palmer & Singer Manufacturing Company Announces Adoption of Magic Motor, Transmission and Wheel for 1914--New Buildings and Department Heads.

**A**T A special meeting of the board of directors of the Palmer & Singer Manufacturing Company, Long Island City, N. Y., held Aug. 27, Charles A. Singer, Sr., resigned as president to become first vice president. Clyde D. Knapp, who formerly held the office of first vice president, was promoted to the presidency. Incidentally, it is announced that demonstrating models of the Palmer-Singer car, equipped with Magic motor, transmission and demountable wheel, will be in the Broadway showrooms of Druet & Page, New York City agent, this fall, and that the company expects to be in a position to fill orders for these in the late spring, probably about June 1.

The change in officials has been made in order to permit Mr. Singer to devote his entire energy and valuable engineering knowledge to the engineering and production end of the company's business. Naturally, this will mean the development of the new motor, transmission and wheel as applied to the new Palmer-Singer models. The company recently acquired the right to manufacture these products, under license from the Motor & Gear Improvement Company, which owns outright the United States patents.

The Magic motor is termed a silent slide crescent valve engine, and was given extended tests by engineers of the industry in Detroit some months since. It is maintained by the Palmer & Singer Manufacturing Company that it will give greater power and efficiency with less vibration and at less cost than other types. The transmission is of the internal gear type, while the wheel has special quick demountable features which are expected to make a decided appeal to the owner.

#### MOON IN THE MIDDLE WEST.

#### New Manager and New Building for Headquarters in Chicago.

The growth of the business of the Moon Motor Car Company, St. Louis, Mo., in the Middle

West, under the management of E. N. Sanders, is best exemplified by the fact that the former quarters of the Moon Motor Car Company of Illinois at 2728 Michigan avenue, Chicago, have proved entirely inadequate. Accordingly, the company has acquired the former home of the Lozier Motor Company at 2612 Michigan avenue, where the new manager, Harry M. Newman, is now installed.

It may be added in this connection, that Mr. Sanders has been promoted to become western sales manager, having complete jurisdiction over the sale of Moon cars in the states lying west of the Rocky mountains. Like so many other successful salesmen in the automobile business, he is a graduate from the bicycle industry. He also

New Home of the Moon Motor Car Company of Illinois on Michigan Avenue, Chicago.

is an engineer of marked ability and previous to his appointment to the Chicago post, which embraces the states of Indiana, Michigan and Wisconsin, as well as northern Illinois, he became thoroughly familiar with every detail of Moon construction. He has been in charge of the Chicago office for the past four years, and prior to that period he was sales manager of the Centaur Motor Company of that city.

Mr. Newman has been associated with Mr. Sanders in building up the business in the Chicago territory. He became sales manager in March, going to the Moon company from the Washington Automobile Company, Washington, D. C., of which he also was sales manager. The branch, under his management, will occupy the

entire building shown in an accompanying illustration. The ground floor front will be occupied by the salesroom, while the rear will be fitted as a Moon garage and service station. The second floor front will be utilized as a showroom for used cars, and the rear for the storage of new machines.

---

#### WITH ESTERLINE COMPANY.

---

#### W. McK. White Leaves Marion Concern to Become Its Sales Manager.

---

Some little surprise was occasioned last month by the announcement that W. McK. White had left the Marion Motor Car Company, Indianapolis, particularly as no statement was made

W. McK. White, Sales Manager, Esterline Company.

concerning his future plans. It transpires that he is to become sales manager for the Esterline Company, maker of electric lighting and starting equipment, which recently removed its plant from Lafayette to Indianapolis. It also is stated that this is the first move to be made by President J. W. Esterline in an effort to increase

considerably the scope of his company.

Mr. White has achieved a reputation among motorists and throughout the industry as an advertising man of prominence. During recent months he has been in the limelight, so to speak, because of his success as tour manager for the Indiana-Pacific tour of the Indiana Automobile Manufacturers' Association. He first came to Indianapolis four years ago, returned to New York for an intermediate year, and then assumed new duties in the Hoosier capital. His wide acquaintanceship among automobile manufacturers, representatives and owners will be of immense benefit to the Esterline Company.

It is stated that Mr. White will direct his attention largely to the distribution of the Golden

Glow lamps, as well as motor starters and complete lighting systems, while the electrical instrument business will be in charge of Mr. Hansell, as formerly.

---

#### PROMOTION FOR E. A. SCHEU.

---

#### Becomes General Manager and Sales Manager of Invader Oil Company.

---

His many friends throughout the industry will be glad to learn that E. A. Scheu, Boston branch manager of the Invader Oil Company, has been promoted to become general manager and sales manager of the company with headquarters in New York City. In the near future he will make an extensive trip throughout the West for the purpose of visiting territorial distributors and appointing new agents.

Mr. Scheu was connected with the Packard Motor Car Company and its Boston agency from 1903 until 1908, when he became the first agent for Invader oils in that city. At that time, and until early in the present year, this business was owned and controlled by Chas. F. Kellom & Co., and Mr. Scheu was its Boston branch manager. When the Invader Oil Company was organized to take over this business he was retained in that position, and later became still more intimately connected with the company in a financial way.

---

#### ASSUMES INCREASED RESPONSIBILITY.

---

#### Chief Engineer Heaslet Becomes Studebaker's General Superintendent.

---

While he will not release his position as chief engineer of the Studebaker Corporation, Detroit, James G. Heaslet has assumed additional responsibilities in accepting the appointment as general superintendent of the company's automobile plants. In this position he will receive direct reports from Production Manager Max Wollering, to whom the superintendents of the various plants in the system will make report.

The enlargement of Mr. Heaslet's responsibilities is directly in line with his Studebaker experiences, as he has at various times taken charge of Studebaker plants and directed manufacturing operations successfully. Of late, however, he has confined his activities to designing. It may be added that he is well known as a designer, having been with the Studebaker Corporation in this capacity for the past four years, and previous to that period with the Autocar, Garford and Rainier concerns.

**POPE HAS GOOD YEAR.****Maker of Pope-Hartford Line Seeks Additional Working Capital.**

The Pope Manufacturing Company, Hartford, Conn., recently announced its intention of devoting the entire time and attention of its pleasure car department to the production of six-cylinder models. This came somewhat in the nature of a surprise, since the maker of the Pope-Hartford line brought out a new four-cylinder machine only last year. The company also produces motor trucks, motorcycles and bicycles. Concerning the business of the past year the Wall Street Journal has the following to say:

The Pope Manufacturing Company, in its fiscal year to July 31, is understood to have made a gain in gross sales of about \$1,400,000, of which \$500,000 came from the bicycle and motorcycle end of the business, and the balance from automobiles. The chief attention of the management is at present concentrated on readjusting the company's finances, liquidating its bank loans and making suitable provision for the maturity next April of \$1,000,000 two-year six per cent. notes. In its last year the company produced a total of a trifle over 1000 automobiles and nearly 60,000 bicycles, the second largest bicycle output in its history.

This statement is of interest in connection with the report from Hartford, Conn., that the company is seeking to negotiate a 10-year mortgage loan of \$2,000,000, the avowed purpose being to have available more ready capital to replace temporarily the large sum which has been used in building up the business.

**DETROIT HOSPITAL PLAN.****Automobile Manufacturers in That City Have Formed Mutual Association.**

Because of the effect of the new employers' liability act now in force in Michigan, and the scarcity of hospital facilities in Detroit, 18 manufacturing concerns in that city have formed the Manufacturers and Mutual Hospital Association. A five-year lease on the Eaton homestead, 484 Jefferson avenue, has been taken and work is in progress toward equipping this for hospital purposes. There will be 24 beds, doctors' and directors' rooms, operating room and general reception room. It is anticipated that about \$25,000 a year will be expended in maintaining the institution.

The concerns forming the association include the following in the automobile industry: Detroit Screw Works, Morgan & Wright, Ireland & Matthews, Detroit Gear & Machine Company, Michigan Steel Castings Company, King Motor

Car Company and Michigan Bolt & Nut Works. Other motor car and accessory concerns are expected to join in the near future.

**A PIONEER ELECTRIC MAN.****Bee Becomes Vice President and General Sales Manager of Edison Company.**

The many friends of William G. Bee will be pleased to learn of his election as vice president and general sales manager of the Edison Storage Battery Company, Orange, N. J. By them it will be taken as a substantial recognition of his work in the electric vehicle end of the industry, and they will congratulate him upon his deserved promotion. Mr.

Bee has been connected with Thomas A. Edison for the past 11 years and has been identified with the automobile industry for 16 years. He entered the electric vehicle field in its earliest commercial stage, going with Col. Pope of Hartford, Conn., about the time of the organization of the Electric Vehicle Company in 1897.

At the beginning of the Spanish war, the following year, he was among the first to volunteer and served as chief gunner's mate on the U. S. S. Gloucester. Returning to the Hartford concern at the end of the war, he spent a year in Mexico in the interests of the company, and was in charge of its exhibit at the Pan-American exposition.

While with the Electric Vehicle Company, Mr. Bee gave Mr. Edison his first ride in an electric machine, this being the latter's first automobile experience. Since the perfection of the new Edison alkaline nickel-iron storage battery a few years ago, Mr. Bee has directed the sales policy, which is said to have resulted in supplying one-third of the batteries in electric truck service, with similar advances in pleasure cars.

William G. Bee, Vice President, Edison Storage Battery Company.

### **PURCHASES SEARCHLIGHT ASSETS.**

#### **Protective Committee the Only Bidder at the Receiver's Sale.**

But one bidder appeared at the receiver's sale of the assets of the Searchlight Gas Company, held in Warren, O., this being the Searchlight Protective Committee, which purchased the property for \$175,000. The committee is said to have been composed of a representation of the creditors and officials of the embarrassed corporation.

The property sold includes a 1.5-story building, about 50 by 100 feet, in Warren, and plants in Canton, O.; Chicago, Minneapolis, Bexar county, Texas, and Harrison, N. J. It was appraised at \$424,000 as a going concern, and was held to be worth \$350,000 as a non-going concern.

### **STEVENS-DURYEA EXPANDS.**

#### **Company Plans Large Additions to Plant Which Will Double Its Capacity.**

The Stevens-Duryea Company, Chicopee Falls, Mass., maker of Stevens-Duryea cars, will build large additions to its new plant at East Springfield, Mass. Work will begin at once, it is said, and many innovations will be made, one of which will be the construction of a half-mile testing track upon which the company's cars will be run, thus obviating the necessity of testing them upon the highways.

With the increase in space available when the additions are completed the company will be able to expand its several departments, which have hitherto been somewhat cramped for room. Whether or not the company will increase its production is not learned, but President Walter H. Whiteside states that the company will double its capacity by the new additions, which were contemplated over a year ago.

### **BUYS CUTTING PROPERTY.**

#### **Move Is Taken as an Indication That Business Will Be Reorganized.**

W. M. Thompson, president of the Jackson City Bank, Jackson, Mich., purchased the entire property of the Cutting Motor Car Company of that city at the recent receiver's sale, his bid being \$30,000 in cash. In addition, the purchaser agrees to assume two mortgages, which with accrued interest amount to about \$25,000.

Although there were about 20 automobile manufacturing firms, private individuals and other interested parties present, the bidding was somewhat slow. The move is taken as an indication that the company will be reorganized within the near future, and this is made somewhat more evident by the fact that plans for a 1914 model are well under way.

### **REMOVING TO DETROIT.**

#### **Sterling Motor Company of Flint, Mich., Takes Old Chevrolet Plant.**

The Sterling Motor Company, Flint, Mich., which recently came under the control of W. C. Little, formerly of the Chevrolet and Little car companies, has removed to Detroit, where it will occupy the plant vacated by the Chevrolet concern. The Sterling company manufactures motors, and the new move will give it some 60,000 feet of floor space, where about 500 men will be employed.

Mr. Little also announces that cyclecar engines will be added to the line already produced by the company. No definite specifications are available at this time. It is understood that beyond assuming the position of general manager, Mr. Little will make no changes in the official personnel at present.

### **AMERICAN CYCLECAR COMPANY.**

#### **Connecticut Electric Manufacturing Company Will Not Change the Name.**

Following preparatory work, which has been carried on in a quiet way for some months, since the incorporation of the American Cyclecar Company, Detroit, comes the announcement that the concern has been purchased by the Connecticut Electric Manufacturing Company, Bridgeport, Conn., which will not, however, change the name of the corporation. Coincident with the transfer of the property, the capitalization was increased from \$1000 to \$200,000. The present officials are: President, A. H. Trumbull; vice president, Harry J. Stoops; secretary and treasurer, I. B. Trumbull.

It is understood that offices will be retained in Detroit, although it is probable that the car will be manufactured in the East. According to an official statement, the machine will have a four-cylinder, water-cooled motor, with bore of 2.875 inches and stroke of four. The wheelbase will be

80 inches and the tread 44. The body will accommodate two persons, seated side by side.

### SECURES HIS OLD PLANT.

#### E. R. Thomas Recovers Possession of Factory Buildings in Buffalo, N. Y.

E. R. Thomas, Buffalo, N. Y., for a number of years prominently identified with the automobile industry in the production of the Thomas car, has purchased the building at 1192 Niagara street, that city, formerly occupied by the E. R. Thomas Motor Car Company. The move was responsible for a number of rumors, having as their basis that he was about to re-enter the industry, either through the production of a light weight motor car or a cyclecar.

Mr. Thomas has seen fit to deny these rumors, explaining that he purchased the property in order that it might not be transformed for tenement or business purposes. He is fitting it for light manufacturing of any kind, although it is explained that it would be available for the production of automobiles without much change.

### TO INCREASE CAPITAL STOCK.

#### Swinehart Tire & Rubber Company Plans a Total Issue of \$1,000,000.

The Swinehart Tire & Rubber Company, Akron, O., maker of Swinehart tires, announces that steps will be taken at the annual meeting for an increase in the capital stock of the company, from \$800,000 to \$1,000,000. In financial circles it is considered probable that the new issue will be preferred stock, although the notice of the contemplated action does not state what form the new financing will take.

The annual meeting has been called for Sept. 24 at the company's general offices at Akron. At this meeting the directors will recommend that the shareholders take the necessary steps to increase the capital. It is probable that the form of new issue will be decided at that time.

### ANOTHER NEW CAR COMING.

#### MacKaye Leaves Keeton Company to Organize Concern for Its Production.

H. D. W. MacKaye, a veteran of the automobile industry, has severed his connection with the Keeton Motor Company, Detroit, maker of Keeton cars, with which concern he was assist-

ant to the president. Mr. MacKaye is the principal figure around which has been organized a new automobile company which will manufacture a car to list for less than \$500.

It is said that the concern has been in process of organization for the past year, engineers having been at work upon the models to be made and other details being worked out. A three-passenger roadster and four-passenger touring car will be built, and it is announced that these will follow so-called French designs.

### MRS. MEIROWSKY GOES ABROAD.

#### Well Known Advertising Manager to Combine Business with Pleasure.

Mrs. Oscar Meirowsky, who as Miss Dorothy Kane was well known in the industry through her connection with the advertising department of the Abbott Motor Company, Detroit, maker of Abbott-Detroit cars, sailed recently for Hamburg, Germany, where she will enjoy a vacation tour of Germany, France and England. Since her marriage, Mrs. Merrowsky has been advertising and publicity manager of the Abbott-Detroit Motor Company, New York City, distributor for this line.

Mrs. Oscar Meirowsky, Advertising and Publicity Manager.

While the European trip has been undertaken primarily as a much needed rest, it will result in the compilation of a route book and general guide for the use of Abbott-Detroit owners. In addition, Mrs. Meirowsky will make a special study of equipment for touring automobiles, a department to which, in her opinion, American manufacturers will do well to pay more attention than in the past.

The dealers in Atlanta, Ga., have decided upon Nov. 8-15 as the dates for the annual Auditorium show in that city.

# MOUNTAIN ROADS OF PENNSYLVANIA.

**An Itinerary Which Takes the Tourist Through the Anthracite Coal Regions, and Visits Many Historic Scenes Both Going and Returning.**

**W**HILE many of the mountain roads of eastern Pennsylvania offer a strong contrast to the touring conditions available in New England, the owner of the modern car does not hesitate to visit country which presents interesting views. It cannot be denied that the district covered by the first portion of the itinerary listed as No. 58 is plentifully supplied with natural beauties, and the section of New Jersey visited offers good roads.

After leaving Philadelphia by way of Fairmount park and passing through Bryn Mawr, the seat of Bryn Mawr College for girls,

Harrisburg from this point is considered the most practical, although the frequent stops at toll gates detract somewhat from the pleasure of the trip.

Harrisburg was made the capital of Pennsylvania in 1812. It is located on the eastern bank of the Susquehanna, which at this point is about a mile wide. The State House is prominently situated on a hill, and was rebuilt recently at a cost approximating \$13,000,000. In Harris park is to be found the stump of a tree to which John Harris, after whom the city is named, was tied by Indians with the intention of burning him

many Wilkesbarre people have their summer homes on its shores. The elevation is 2200 feet, and the lake itself is shut in by rocks and hills, which with the pristine freshness of the woods make it an ideal spot at any season of the year.

Leaving Eagles Mere, the route is well defined, since it is used almost constantly during the summer by motorists from Wilkesbarre who frequently make the trip between their summer homes and their places of business. Upon reaching Nanticoke, the Wyoming valley is followed into Wilkesbarre, in the centre of the coal mining country.

Wilkesbarre was founded in 1772 and named in honor of the two chief partisans of American liberty in the British Parliament. Wyoming valley, of which it is the metropolis, was the Indian Maughwauwama, meaning large plain, and is about three miles wide and 20 long, enclosed by two parallel mountain ranges from 800 to 1100 feet high. The tour enters it through the Nanticoke gap and leaves through the Lackawanna gap.

The entire distance between Wilkesbarre and Scranton lies in the heart of the anthracite coal district, and is marked by collieries and villages of foreign workmen. Nowhere else in America is it possible to study this phase of mining to better advantage. From the driver's point of view the conditions are by no means ideal, since there are many branch railroads and spur tracks, necessitating extreme caution. In addition, the village streets are very narrow and children and animals roam at will.

The route from Scranton to Delaware Water Gap is over the Pocono range, and is one which is followed annually by thousands of motorists. The first portion involves a steady climb up the western slope of the Alleghenys to Tobyhanna. Then follows Mt. Pocono with its numerous sum-

**Washington's Headquarters at Valley Forge, as It Appears Today.**

the tourist has opportunity to visit Valley Forge, famous as Washington's headquarters during the winter of 1778-9. The old farm house which he occupied is still standing, and the entire camp has been reserved as a public park.

Near Pottstown is an interesting group of stones known as the "Ringing Rocks," which emit a peculiar ringing sound when struck. The drive between this city and Reading is replete with splendid views, and near the latter city are two mountains of more than passing interest, Penn and Neversink. The route to

alive. The Pennsylvania railroad's stone arch bridge across the river is said to be the longest in the world.

The road leading from Harrisburg to Eagles Mere follows the Susquehanna river for many miles, affording many rich river and mountain views. In places the way is rough and stony, and at some points caution must be used in crossing the railroad tracks. At Muncy the route turns into the hills for a picturesque drive into the virgin forest about Eagles Mere, or the Lake of the Eagles. This is a favorite spot for fishermen and hunters, and

One of the Interesting Automobile Drives Seen in Fairmount Park, Philadelphia.

mer hotels, and the long descent of Pocono mountain into the valley of Broadheads creek and Stroudsburg. After leaving Stroudsburg the route crosses Mt. Michaels creek, descends Godfrey ridge, and follows Cherry Creek valley to the gap.

The Delaware river is crossed on an old fashioned flat boat attached to a cable, then the valley of the Musconetcong in New Jersey is followed into Hacketts-town. After leaving that city there is a steep grade up Schooleys mountain, but the road has been placed in such condition that little difficulty is experienced. At the summit is a well known summer resort, overlooking the Musconetcong and German valleys, and it is stated that Washington spent a part of a season there in 1793. Good macadam roads take the tourist into Morristown, Washington's winter quarters in 1779-80. The house occupied by him is now maintained as a historical museum.

The night stop is at Elizabeth, within easy access of New York City. Near Freehold may be seen the monument commemorating the battle of Monmouth, June 28, 1778, in which Gen. Lafayette played such an important part in the routing of the British army. Lakewood is one of the most popular summer and winter resorts in the North. Situated amid the pines of New Jersey, near the coast, there are many pretty

walks and drives through the woods, as well as two picturesque lakes, Caysaljo and Maneta.

Following the main route from Lakewood to Atlantic City for a time, the way leads through several of the Jersey coast towns to New Gretna, after which it enters the rich market gardening district of which Hammonton is the centre. The tour passes through the outskirts of Hammonton, at which point a pleasant little side trip to Hammonton lake may be made. The remainder of the distance is with market gardens on

either side, until almost within the city of Camden, where the ferry into Philadelphia is reached.

The Massachusetts state highway commission is making its first test of concrete road surface in North Andover, where about 1.5 miles of this pavement has been laid this year. An additional contract for two more miles has recently been awarded. The road

surface is 18 feet wide, with a substantial shoulder of three feet on either side. It is explained that it is laid in much the same manner as a granolithic sidewalk, except that the finish is not quite so smooth. Someone between Norwich and

Willimantic, Conn., has adopted a novel method of calling attention to a dangerous railroad crossing, having posted a sign reading as follows: "Danger! This railroad crossing is a well designed death trap and is a disgrace to the State of Connecticut."

## VULCAN CHASSIS IS WELL CONSTRUCTED.

**B**ELIEVING that the interests of the agent and prospective purchaser would be best served by not making public the details and price of its product until ready to make actual deliveries, the Vulcan Manufacturing Company, Painesville, O., has delayed its announcement of the Vulcan "27," a popular priced, light weight car, which will be constructed in one chassis having two body styles. These include a two-passenger speedster and a five-passenger touring car, the chassis of the latter differing only in the frame, wheelbase and springs.

Since its inception the efforts of the company have been centred on the production of a simple,

gauges, the master being held at the inspection department and the service being used by the machinists.

Every piece of material which enters into the machine is carefully selected and tested, and drop forgings are utilized wherever possible. Where strength and lightness are desired, pressed steel is employed, and the material is carefully analyzed. All castings used in the Vulcan are made in the company's foundry, which is equipped to produce castings free from blow holes or chilled spots.

The Vulcan motor is of the four-cylinder, L head type, with the cylinders cast en bloc, and it

**Vulcan "27" Speedster Model Has Attractive Lines and Is Built Completely in the Factories of the Vulcan Manufacturing Company.**

durable design, one having ample power to meet the requirements of every day service, capable of being maintained at a minimum cost, and possible to manufacture economically and in quantity to permit a low selling price. All parts and units entering into the construction of the Vulcan are manufactured in the factories of the concern and it has taken several years to equip the plant with the special machinery, dies, jigs and tools necessary for an economical production. The mechanical engineers are men of wide experience in the automobile industry, and the Vulcan shows the result of careful designing, in that the number of parts is reduced to a minimum and each is interchangeable. Every part must pass through a set of limit gauges, which insures accuracy and uniformity, and there are two sets of these

will be noted by accompanying illustrations that it is very simple in design as well as compact. The bore is 3.375 inches and stroke five, which places it in the long stroke class, and the dimensions should make for economy of fuel, also efficiency at low speeds. Although rated at 27 horsepower, this is stated to be conservative, it having developed considerably in excess of this rating in dynamometer tests. The components of the power plant are liberally proportioned throughout. The usual pan or shield is provided. The crankshaft is a heavy drop forging with the flywheel flange forged integral, and is carried in bearings 1.875 inches in diameter. These are extra long, the rear member being 5.5 inches. Both main and connecting rod bearings are fitted with heavy boxes, die cast from non-friction

white bronze, a metal of great durability. The connecting rods and pistons are very long, the latter having three rings above the wristpin and their design is such that they should be lubricated easily, and the oil should be prevented from working into the combustion chamber. The connecting rods are of the split type and are fitted with an oil scoop.

The camshaft is a solid drop forging with integral cams, and is supported at the centre by a wide bearing, eliminating the possibility of springing. All cams are integral and their surfaces are ground true after hardening. The valves, which are located on the right, are 1.625 inches in diameter and are enclosed by a single plate retained by two hand screws. They are very accessible and means are provided for adjustment. The exhaust manifold is a straight one-piece construction, retained by six bolts, and

crankcase. It is positively driven, the same gear actuating the fan pulley shaft.

The lubrication system is a combination of the positive feed and constant level splash type. A plunger pump forces the oil from a six-quart reservoir in the lower crankcase to all bearings and gears, and maintains a predetermined level in the crankcase, into which the ends of the connecting rods dip, splashing lubricant to the working parts. The supply is noted easily by a float gauge at the base of the motor.

The design of the motor and its liberal sized water jackets, outlet and inlet pipes, favor thermo-syphon cooling. The cooled fluid enters at the lower left hand side of the motor and circulates around the valves and head, passing out through a one-piece outlet manifold to a large capacity vertical tube type radiator. Cooling is further aided by a ball bearing 12-inch fan, driven

**Sectional View of Vulcan Chassis, Showing Sturdy and Well Designed Components, Also Unit Power Plant and Low Centre of Gravity.**

its proximity to the well designed intake manifold facilitates carburetion. The exhaust manifold is ribbed to facilitate radiation of heat, which, with an exhaust pipe of large diameter, reduces back pressure to a minimum.

Vaporization of the fuel is aided by hot air, a short flexible tube connecting the air intake with the exhaust manifold. Feed is by gravity, the high position of the tank insuring a maximum flow even when ascending the steepest grade. The fuel tank of the roadster is 12 inches in diameter and 30 long, of round construction, with dished ends and made of heavy gauge, lead coated steel. The joints are lap seamed and soldered, and the container is designed to be leak proof.

Ignition is by a true high-tension magneto located on the left hand side of the motor and mounted on a bracket cast integral with the

by a flat belt and having means for adjustment. The timing gears are carefully cut, insuring quiet operation, and are accessible. Throughout, the power plant is noticeable for simplicity and a small number of exterior parts. Extreme care is taken in the assembly and testing, and the inspection is very thorough.

The motor, clutch and transmission are a unit and the method of mounting differs from conventional practise. The three point suspension is utilized, but the rear cross member is bolted through the centre of the transmission case. This support is liberal in size and is sufficiently sturdy to resist the torsional and thrusting strains of operating over rough and uneven roads. The clutch is of the cone type, 13 inches in diameter, having a facing of leather 1.5 inches wide. Pressure is maintained by eight expanding spiral

springs pressing against the aluminum clutch wheel at one end, and a pressed steel spring spider at the other. Release is effected by a pedal operated yoke, and so easy is the clutch in its action that it can be disengaged by a slight pressure, a factor which will appeal to women drivers. The yoke is provided with tapered roller bearings, which engage in a deep groove in the clutch wheel hub. The clutch wheel is mounted on ball bearings, and the mechanism is fully enclosed but easily accessible through a large inspection plate at the top of the housing.

The transmission is of the selective type, three speeds forward and reverse, and the low gear is such as to make starting easy and gradual. It is also of value in operating over bad and hilly roads, etc. The gears are of a 3.5 per cent. nickel steel, carefully heat treated, and the teeth are

**The Vulcan Motor is Noticeable for its Simplicity and Compactness—It is Carried on a Three Point Suspension.**

tively avoided in the Vulcan universal joint.

The rear axle is of the semi-floating type, the weight of the car being sustained by large ball bearings mounted on the tubular housing. All ball bearings utilized in connection with the transmission of the power to the rear axle are oversize, making for durability.

The main driving gear is machined from a solid drop forged ring of 3.5 per cent. nickel steel, and the pinion from a solid bar of the same material. The teeth, which are extra large, being 1.25-inch face, are planed with a Gleason gear tooth generator, insuring accurate proportions. The teeth on the driving pinion are reinforced by an added brace extending back .375-inch beyond the tooth on the gear hub. All gears are carefully heat treated and hardened. A large New Departure self-contained ball bearing is utilized immediately back of the driving pinion. The axles are 1.1875 inches in diameter.

The gear type of differential is employed, but differs from conventional design in that five pin-

**Magneto Side of Vulcan Motor, Showing Enclosed Fly-wheel and Method of Bolting Cross Member to Transmission Housing.**

wide, being from .75 to 1.125 inches. The engaging gears are chamfered by special machinery, making for quiet engagement and operation. The change speed lever is set in a ball and socket below which is the H cast in the transmission housing, and the lever is of the cane handle type, surmounted by an aluminum ball conforming to the shape of the palm of the hand.

Drive is by shaft through a torsion tube. The front half of the universal joint housing is cast integral with the rear half of the transmission case, forming, with the pressed steel cap bolted to it, the socket for the ball. The last named is of drawn steel, pressed and riveted to the end of the torsion tube. The hollow ball and socket forms a grease tight housing for the universal joint and also transmits the energy of the motor to the rear axle. The two yokes and centre piece constituting the universal joint are heavy drop forgings having large bearings. The maker lays great emphasis on the construction, stating that lost motion after considerable service is posi-

**Indicating the Liberal Proportions of Some of the Working Parts of the Vulcan Motor—Note the Size of the Main Bearings of the Crankshaft.**

**A Section of the Vulcan Tool Room Where Special Tools, Dies, Jigs, Etc., Are Constructed.**

ions are utilized, a construction making for great strength and durability. The pinions are of nickel steel, phosphor bronze bushed, and revolve on a drop forged spider. The bearings are 4.0625 inches in diameter and .625-inch balls are used. The rear axle housing is liberally ribbed and a large inspection plate is easily removed. The wheels are grade A, second growth kiln dried hickory, 12 spokes to a wheel, with malleable iron hubs. Ball bearings are employed, .625-inch balls being fitted to the inner bearings and .5-inch on the outer.

The front axle is tubular, with the usual drop in the centre. The steering knuckles, levers and yokes are extra large, providing a large factor of safety, the knuckles being 1.375 inches in diameter. All are drop froged from a special alloy steel, selected for its great tensile strength. The method of attaching the steering lever to the knuckle is such that the car can be turned in a circle 30 feet in diameter. The clearance under the centre of the front axle is 10.5 inches.

The steering gear is of the rack and pinion type and the dimensions of the parts are such that there is a large factor of safety. The company points out that this type of gear makes for easy steering on the roughest of roads with a minimum of effort. The column is set at a comfort-

able angle, one bringing the 16-inch wheel convenient to the operator. The pinion end of the column is hung to the front cross member just to the rear of the front axle, a location eliminating surplus rods, bell cranks, etc. The front wheels are slightly dished, bringing the point of tire contact in a direct vertical line with the steering knuckle pivot, aiding in steering and reducing road shocks.

The brakes are ample in size and the leverage is so arranged that a gentle pressure is sufficient to stop the car. The service members are of the external contracting type, while the emergency are internal expanding,

operated by the conventional hand lever. Both sets of bands are lined with a high grade material and operate on a large pressed steel drum securely mounted.

The springs of the Vulcan are well designed, have ample clearance, and are so proportioned as to provide easy riding qualities. The front members are semi-elliptic, and the rear, three-quarter elliptic. They are 46 inches long, 1.75 wide, and the steel utilized is a special alloy and very flexible. The spring eyes are bushed with Tobin bronze, the bolts being ground carefully to size, and provided with grease cups. The rear springs are secured to large pads by drop forged clips.

**A Few of the Special Tools and Jigs Utilized in the Machining of Parts Used in the Vulcan Car.**

The frame is U section pressed steel of liberal dimensions, and the three cross members are rigidly braced. A kickup at the rear makes for a low centre of gravity. The wheelbase of the speedster is 105 inches, that of the five-passenger chassis, 115.

Left hand control is employed with the gear shifting and emergency brake levers at the right in the centre. The clutch pedal is at the left, with service brake and accelerator at the right. Clincher rims and 32 by 3.5-inch tires are standard equipment.

The body is not only attractive, but provides maximum room and comfort. It is constructed of live oak reinforced by drop forged body irons, securely bolted, and covered with heavy, bright finished body steel. Fore doors permit of entrance from either side. The seat is unusually wide and the back is high, supporting the shoulders. The relative position of the cushion, back

body is painted in a very attractive shade of dark olive green and the five coats are carefully applied and finished. The trimmings are triple nickel plated, and all black parts, such as screw heads, nuts, etc., are black nickered. The wheels are finished in dark olive green to match the body. The equipment of the Vulcan is very complete and the accessories are high grade, these including mohair top with adjustable curtains, slip cover, speedometer, latest design lamps, tools, tire repair kit, compound pump, jack and high grade windshield.

The company calls special attention to its selling policy, which aims to get its product to the purchaser with the least possible expense. In determining the list price no allowance has been made for the commissions of district sales agents, distributors, etc.—only that of the local dealer. The dealer's agreement is said to be particularly liberal and differs from the usual form in several

**Factories of the Vulcan Manufacturing Company, in Which Each Part and Unit Is Constructed in Large Quantities and to Accurate Proportions.**

and floor board, has been carefully figured out to provide comfort. The upholstery is luxurious and durable, long spiral springs being covered with a thick padding of curled hair.

The fenders and splash aprons are of heavy gauge, bright finish steel with lips and beads to obtain stiffness and permanency of shape. The bracketing combines light weight and rigidity. The headlight and fender brackets are combined by a triangular leverage. The steps on either side are supported by strong angle irons extending across the chassis beneath the running boards. These irons are suspended from the main frame by vertical forgings, a construction eliminating vibratory and twisting strains.

The hood, fenders, gas tank and running gear are finished with two coats of black enamel, baked on over a special metal primer, preventing rust and making for adhesive qualities. The

ways. The sales department of the company is headed by men of wide experience in the automobile industry and all selling expense is reduced to a minimum. The location of the plant is ideal for a quantity production and the shipping facilities are excellent.

The officers and directors of the Vulcan Manufacturing Company are men of wide business experience, each chosen for his special fitness to the work at hand. F. H. Murray, president of the company, is well known throughout Ohio, and R. G. Ewell, the vice president, is conceded an authority on business economics, and has a wide experience in advertising and sales promotion. E. D. Heartwell, treasurer, is well and favorably known in Ohio banking circles. The other directors, H. E. Hammar, J. C. Ward, William Truby, E. E. Lawrence and W. H. Becker, are business men of prominence.

## NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

**Talking Horn.**

A signalling device which presents interesting features, in that it may be utilized as a signalling horn or to produce sounds closely resembling the human voice, is the Talking Horn, manufactured by the Talking Horn Company, Middletown, N. Y. It resembles in appearance the conventional types of signalling members, but is manually operated, a small handle being fitted. When this is moved to certain positions, then rotated to the left, it is stated that it will talk, producing one of three phrases, "Hello Mama," "O Mama" and "Mama." The maker of the device claims that the resulting effect is pleasing to the pedestrians and that sound can be heard for a considerable distance. By rotating the handle anti-clockwise a plain sound is produced. The positions for the different phrases are lettered on a dial under the handle and it is stated that with a little practise one can manipulate the handle without reference to the marks. The device comes finished in brass or nickel to match the car. The company also produces the O. B. horn, similarly operated, but without the talking feature, and one adapted to the motorcycle.

**Cutler-Hammer Switch.**

The Cutler-Hammer Manufacturing Company, Milwaukee, Wis., is producing a neat, compact single switch for lighting purposes, designed primarily for use with low voltage systems. It has a current carrying capacity of 10 amperes at 80 volts; operates with a quick make and break, and is a simple three-piece mechanism. The insulating material is both fire and water proof, and the mechanism cannot jar loose. The position of the push bar indicates whether the switch is open or closed, and a feature of the design is that it may be operated in concealed places, it being possible to tell by touch whether the switch is on or off. Pushing the button opens the circuit, thereby avoiding opportunity of accidentally closing the circuit in the day time and running down the battery when the lighted lamps would not be noticed. The face plates are supplied separately, have bevelled edges and are applied after the switch is installed and without cutting.

**Se-Ment-Oil.**

Se-ment-oil is manufactured by the Northwestern Chemical Company, Marietta, O., and is a colored powder like material which is soluble in water. When poured into a radiator it will dissolve easily and will remain in a fluid state until it comes in contact with a leak in the cooling system, when it will congeal, cementing the cavity. It takes but a short time for the cement to set, after which the radiator is flushed out with clean water. It is a chemical preparation and is held not to injure the cooler or impair its efficiency. Much of the deposits

caused by the use of hard water is removed by its use. It comes in a small package and is inexpensive.

**Noera Oil Gun.**

The Noera Manufacturing Company, Waterbury, Conn., is marketing an improved oil gun which is provided with a crooked handle, facilitating its operation. The gun is 1.25 inches in diameter, eight long, and is constructed of a high grade brass, nicely polished. It will handle equally well, light or heavy oils, and is provided with a double plunger, one set drawing in the lubricant and the other forcing it out to the part to be lubricated. The Noera oil gun is also made with a round handle.

**Old Sol Universal Lamp Bracket.**

The Old Sol universal adjustable lamp bracket is the product of the Hawthorne Manufacturing Company, Bridgeport, Conn., and is designed especially for motorcycles. The maker states it will fit any standard make of machine. The bracket with the rigid truss type of clamps permits of mounting a gas tank, generator or storage battery and all makes of lamps. When the tank bracket is installed the company supplies bands for holding the tank in position. A flat plate punched with a hole and equipped with a locking device and bolts is furnished with the generator type.

**Blue Head Spark Plug.**

The Blue Head spark plug, manufactured by the Perpetual Spark Plug Company, 330 East Drinker street, Dunmore, Penn., is a popular priced plug and differs from ordinary design in that it is practically of one-piece construction. The central electrode is baked in the porcelain and the latter is placed in the shell by a similar process. This eliminates joints, gaskets, etc., making for a gas tight design. One of the features of the plug is the shape and location of the spark gap. The wire is bent upward to within a short distance of the shell, the maker stating that the construction prevents short circuiting by oil, also makes for easy cleaning.

**Greenfield BX Cable.**

The Sprague Electric Works of the General Electric Company, New York City, manufactures the Greenfield flexible steel armored cable, also known as the BX cable. It is a weather proof construction, possessing great mechanical strength, maximum flexibility and ability to withstand chafing. It is constructed with single or twin conductors.

**Berling Magneto.**

A large spark, compactness of design and simplicity are emphasized with the Berling magneto, produced by the Ericson Manufacturing Company, 1119 Military road, Buffalo, N. Y. It is constructed for motor car and stationary engines, motorcycles, etc., and is held to be wa-

Talking Horn

Cutler-Hammer Switch

Noera Oil Gun

Old Sol Universal Bracket

Se-ment-oil

Blue Head Spark Plug

Berling Magneto

ter, oil and dust proof. It is of the true high-tension type, and it is claimed that it will start a motor with the spark retarded and that throughout the best of material and workmanship are incorporated. The frame is a solid unit and all parts are easily accessible. The high-tension cables are so mounted that opportunity for short circuits by water is eliminated. The type N is supplied in one, two and four-cylinder models.

#### Peerless Ford Power Tire Pump.

Power tire pumps on the motor car are a valuable addition to the equipment, saving as they do the work of pumping by hand. The Peerless Accessories Manufacturers, 1926 Wabash avenue, Chicago, is marketing a design for model T Ford cars which is driven from the extension of the crankshaft of the motor and is attached by drilling a single hole. A special fan pulley is furnished to replace the old member, and it is claimed that the power pump may be installed easily. The pump cylinder is cast iron and the piston rings are carefully fitted. All bearings are brass. The pump is operated by a rod extending to the front of the radiator. The company claims it is the first pump to be driven from the engine shaft. It is moderately priced.

#### Gallagher Carburetor.

Among the features claimed for the Gallagher carburetor, made by the Gallagher Carburetor Company, Inc., 1876 Broadway, New York City, are: That it is mechanically operated without springs, cams or balls, and that there are no automatic movements to be affected by fuel and atmospheric changes. The supply of air and fuel is regulated mechanically and all parts are adjustable to meet requirements of service. Two jets are utilized, one being a fixed member, the other a mechanical, the latter coming into service when the throttle is opened. The fuel supply to this jet is operated independently from the fixed member by a mechanical needle which comes in contact with the nozzle when the throttle is closed, but rises when the throttle is opened, admitting gasoline in proportion to the air. The fixed nozzle is supplied with fuel by a set needle valve and it has its own air intake. It is utilized for starting purposes and for low motor speeds. The needle valve controlling the flow of gasoline to the float chamber is adjustable by simply removing a screw cap. Provision is made for hot air or hot water heating, or both. It is stated that the carburetor is easily adjusted and provides maximum efficiency with a minimum consumption of fuel.

#### Pilot Horn.

The Pilot horn is the product of the Nonpareil Horn Manufacturing Company, 75 Wooster street, New York City. It is mechanically operated, dispensing with batteries, wires, etc., and there is no other expense involved than its first cost. It is operated by a small, conveniently located hand wheel, a slight turn of which produces a low

and pleasing tone. The sound may be increased to a loud blast by increasing the speed of rotation, and the maker states that this construction permits a wide range of sound as desired. It is furnished with brackets for attaching to either the right or left hand side of the car, and is also made with a straight projector and a fore door bracket. The finishes are: All black, black and brass, black and nickel. A design for the steering column is constructed, a special bracket being made.

#### Perfect Anti-Rattle.

The Adams Manufacturing Company, Kansas City, Mo., is marketing the Perfect Anti-Rattle, which is designed to be placed between the door and jamb of a motor car body and to eliminate existing rattles due to warping or faulty fitting of the door. The device comprises a barrel member in which is a spiral spring. The design also includes a bumper or plunger as shown in the accompanying illustration. The barrel is constructed of brass and fits tightly into the hole bored in the door jamb. When the door is closed the spring pushes the bumper against the door, holding it firmly and eliminating, it is said, all rattling.

#### C. O. D. Indicator.

The Roller-Smith Company, 203 Broadway, New York City, maker of electrical equipment, has brought out a new current indicating device which is termed the C. O. D., from its three indications, "Charge," "Off" and "Discharge." It is designed for service with electric lighting and motor starting systems and to indicate whether the battery is being charged, discharged or the generator is inoperative. The device is located on the dashboard and has a rectangular dial opening through which in the condition shown appears the word "Off." When current flows from the generator through the indicator to the cells of the battery the word "Charge" immediately appears, no matter how slight the rate of current. When the battery is called upon to supply electricity to the lamps, for example, the word "Discharge" appears. It is claimed that no springs, cams, levers or mechanical multiplying means are employed, there being but one moving part. The circuit through the instrument is of heavy copper strap of a cross section greater than that utilized for the ordinary wiring circuit, so that losses are negligible, and there is no possibility of a burn out.

#### Dalitz Spark Plug Tester.

The usual method of locating a missing cylinder is to short circuit the second wire at the spark plug with magneto ignition or to hold down a vibrator with the coil and battery system. When using a screw driver for testing, one is likely to receive a shock unless care be exercised. The Dalitz Manufacturing & Sales Company, 803 Union street, Seattle, Wash., is marketing the Dalitz spark plug tester and terminal, which is a simple device for attachment to the plug. It comprises a flat strip of

metal, having at one end a terminal for the reception of the secondary wire, and an opening at the other in which is inserted a movable arm of metal. This arm is equipped with a non-conducting handle, preventing any possibility of shocks when using the device. To cut out the ignition to a cylinder the movable arm is slid downward until its end comes in contact with the base or shell of the plug. This effectually grounds or short-circuits the current, preventing it from reaching the air gap. The device may be utilized for a number of other purposes, including that of testing the strength of the secondary current. This is performed by moving the arm in proximity to the base of the plug and noting the intensity of the spark. The tester may also be employed to note the compression of each cylinder when in operation, by the strength of the explosion. Another use for the device is locking the ignition. This is obtained by grounding each arm when the car is left unattended.

#### Dayton Valve Lifter.

The Dayton Malleable Iron Company, Dayton, O., is marketing a new valve lifter which is a U shaped member with integral tapered points. It may be utilized in the conventional manner or to compress the spring by placing the points between the coils. It is operated by a wing headed screw bolt having sufficient leverage to compress the spring with a minimum of effort, and one of the features of the device is that both hands may be used in displacing the locking mechanism of the valve, the tool remaining in a locked position. The maker states that it will fit all types of motors. It is moderately priced.

#### Automatic Gasoline Saver.

A device which is stated will save 25 per cent. of the fuel and increase the efficiency of the motor is the Automatic gasoline saver, the product of the Automatic Gasoline Saver Company, 1777 Broadway, New York City. It is utilized with the carburetion system and comprises a hollow circular metal member having an air inlet at the bottom. A metal ball seats in this opening and normally closes the aperture by the pressure of a spiral spring. The movement of the ball from its seat is regulated by the spring and by the suction of the piston of the motor. Means are provided for suitably tensioning the spring to regulate the amount of air admitted. The principle involved is that of atomizing any particles of fuel not properly vaporized by the carburetor, thus permitting less fuel to be used.

#### Clum Trouble Light.

The Clum Manufacturing Company, Milwaukee, Wis., has brought out a trouble light attachment which is designed for service with its standard model lighting switch, providing a means for attaching an inspection light without any additional wiring. The lamp is oper-

ated by a simple socket and plug connection, as shown in the accompanying illustration.

#### Manhattan Polarity Indicator.

In charging storage batteries, and in wiring some circuits, it is essential that polarity be observed, and this is not always easily determined as the identification marks may be obliterated. The Manhattan Electrical Supply Company, 17 Park Place, New York City, is manufacturing the Manhattan polarity indicator which, when connected in the circuit, will instantly detect the negative and positive poles. It is very compact, being 3.5 by .75 inch, and a nickel plated shell encloses and protects the glass tube from injury when carried in the pocket or in the tool box. It is made for battery service, also for service with current ranging from 50 to 600 volts.

#### A-B Magnetic Trouble Lamp.

The Adams-Bagnall Electric Company, Cleveland, O., is marketing a handy trouble electric lamp that differs from the conventional designs in that it is of the magnetic type. It is equipped with a flexible lamp cord and terminals for attachment to the storage battery, and when the base of the lamp is placed in contact with iron or steel, it will stick. This is due to magnetism and it is claimed that the magnet has a pull of 13 pounds. The device makes for convenience in that it may be placed as desired, to project the rays onto the work and to permit the use of both hands when making adjustments or repairs. The magnet is covered with aluminum and the silver plated reflector is 2.5 inches in diameter. The light weighs but 13 ounces.

#### Hoyt Ammeter.

Owing to the demand for a miniature switchboard type of ammeters and voltmeters, for service with lighting and motor starting systems, motor boats, etc., the Hoyt Electrical Instrument Works, Penacook, N. H., has brought out what is known as the type 22, which is very compact, being but 2.25 inches in diameter. They are designed for service with direct current and operate on the D'Arsonval principle. Jewel bearings are incorporated and they combine all the qualities of the larger instruments for which this company is noted. The voltmeters and ammeters are constructed in four sizes, for 10, 15, 30 and 50-volt systems. The indicating hand registers both charge and discharge with the ammeter types.

#### S & V Ford Rebound Snubber.

Sunvold & Larson, Sacred Heart, Minn., is manufacturing a rebound snubber designed especially for model T Ford automobiles. It comprises a strap, coil spring and a device for attaching to the frame and it is stated that it may be fitted without the drilling of holes, etc. The function of the snubber is to eliminate road shocks and to prevent undue recoil, which results in breakage of the springs. The S & V design is applicable to both the front and rear of the Ford car and comes in pairs or a set of four. It is moderately priced.

## MECHANICAL NOTES FOR OWNERS.

### Explaining Different Wiring Plans of Electric Lighting and Motor Starting Systems--- How Clutch of Model T Ford Is Adjusted---Home Made Terminals.

IN ITS booklet dealing with electrical installations on automobiles and motor boats, the Packard Electric Company, Warren, O., calls attention to the importance to every owner of securing a wiring diagram of the installation of the electric lighting and motor starting system on his car. It is further suggested that he should understand it and be able to trace the path of the current flow over each circuit. He should be able to locate every place where wires are connected, whether to other wires, to switches, fuses, battery, generator, lamps, etc.

In studying a wiring diagram the first thing to determine is whether it is a one, two or three-wire plan. The first named is easily ascertained as the wires are utilized only to lead current to the place where it does its work—that is, the lamps—the return being made through the ground as is standard in ignition systems.

The two-wire plan is shown at Fig. 1, in which it will be seen that one wire, the positive +, leads directly from the battery to the switch, where distribution to the various circuits is made. In tracing the flow of the current it will be noted that it leaves the headlight section of the switch and passes to the connection A, where it divides, part going to one lamp and part to the other. On the return, current from both lamps passes over the same wire. The headlights are connected in multiple; that is, the current does

not have to pass through one lamp then through the other before reaching its return path.

The side light circuit is similar to that of the headlights, but it will be noted that the returning current is led to the same wire used for return from the headlights, as will be seen by reference to B 1 and B 2. The tail light circuit is simple, although here the common return wire is utilized, which is also connected to the return battery wire C. If a horn were to be added, one of its wires would be connected to the feed wire between the battery and the switch, and the other to the common returning wire to the battery.

The three-wire plan is employed when six-volt lamps are utilized for lighting and a battery of higher voltage for starting. A wide range of voltages is used by makers, 12, 16, 18, 24 and even 30-volt being utilized to meet the requirements of designs. While the wiring diagrams of such systems appear complicated to the average car owner, the fundamental idea can be understood readily by a little study of Fig. 2, which shows a 12-volt battery used in connection with six-volt lamps.

Although the battery is a 12-volt member, which is required for the 12-volt electric motor, it will be seen that it is in effect divided into two six-volt members by means of the third wire C, which runs from the centre cell connection to the switch. It will also be noted that there are

Fig. 1—Assembly Drawing Showing Electric Lighting System, Having Six-Volt Battery and Lamps and Employing the Two-Wire Method.

six cells. The voltage of a battery may be determined easily by observing the number of sections on the top cover, each representing two volts. If a one-piece cover be employed, and the terminal posts are brought above it, each pair of posts will represent two volts.

The headlight circuits are traced easily in the three-wire plan. The current leaves the positive terminal of the B section of the battery, flows to the right headlight and returns to the switch, thence by the way of the wire C to point X, which is the negative — terminal of the battery half B. Point X is also the positive + terminal of the battery half A and thus the current leaves X through the wire C to switch, to the left headlight and back to the — terminal of battery half A. It will be seen that the wire C takes care of currents in opposite directions and actually carries only the difference in the two current values.

Fig. 2—Wiring Diagram of Three-Wire Lighting and Starting System Employing 12-Volt Battery Which Is Divided to Permit Use of Six-Volt Lamps—The Starter Is a 12-Volt Motor.

When these are equal, that is, when both lamps are drawing the same amount of current, no electricity whatever flows in C. If one lamp burns out, C carries the full lamp load.

The right hand side light and the speedometer lamp are served by battery half B, while the left hand side light and the tail lamp draw current from battery half A. Only one-half of the switch is shown, the other section being arranged to permit of turning on the headlights, side or tail lamp separately. The starting motor takes the maximum voltage of the battery, as shown by the connections.

### STOP FOR CAR.

A motorist who has owned several cars and who stored his machine in a small garage where

room was limited, evolved a practical plan for placing his automobile as well as preventing injury to it in the event the brakes failed to grip properly. Two pieces of 3x4 joist five feet long were secured together and nailed to the floor within a suitable distance of the wall. Being six inches high, the structure would stop the motion of the car even if the brakes failed. The joists also served to denote the proper position of the machine when entering the garage.

### TAPING GAS TUBING.

The rubber tubing utilized to convey acetylene from the source of supply to the lamps deteriorates in time, owing to the action of the air and light. If the tube is a short one, between the metal pipe and lamps, for example, it may be covered with tape. To prevent crushing the walls

of the tube, a rod is inserted and by winding the tape carefully a neat appearing job may be the result.

This same method may be utilized with success where the tube is secured to the outlet of the generator. The stretching of the rubber causes it to deteriorate quickly and sometimes it is difficult to remove it when a new piece is to be fitted.

### ADJUSTING FORD CLUTCH.

In the August number of the Ford Times, a publication devoted to the interests of the Ford Motor Company, Detroit, is an illustrated article dealing with the adjustment of the clutch. The clutch is normally held in contact or engaged by a clutch spring shown in the drawing at Fig. 3,

and is disengaged by pushing forward a pedal or by utilizing the emergency brake lever.

If the clutch shows signs of slipping, that is, the motor races when ascending a grade or when the load is applied suddenly, it should be remedied. With the motor inoperative and the emergency brake lever moved forward to its maximum position, the floorboards and transmission cover are removed. Directly in front of the clutch spring will be noted three clutch fingers. Each has a cotter pin extending through it, and a set screw. By removing these pins the screws may be rotated.

It is best to give each set screw a half turn, and in order, then replace the cotter pin and try the action of the clutch. If it still slips another half turn should be made. It is important that each set screw be given the same number of rotations to insure proper operation of the clutch. The ends of the cotter pins should be spread as shown in the drawing to prevent their working out and changing the adjustment of the set screws.

### A CARBIDE HINT.

A contributor to a British motoring print suggests a method of handling carbide utilized in generators. It comprises placing the material in a linen or muslin bag for filling the generator. It is stated that it facilitates cleaning the generator and makes for convenience in replenishing the supply as the required amount is always available.

### CARE OF THE COIL.

The writer has frequently noted drivers operating their cars with the cover off the coil box, this presumably being done to adjust the vibrators when the car is running. The machine should not be operated with the coil units exposed as more or less dust is apt to find its way into them and cause short circuits, for which the maker of the system is blamed.

### HOME MADE TERMINALS.

More or less scrap accumulates in the garage and much of the material can be put to a good use—old copper or brass tubing, for example. This may be utilized to make low or high-tension terminals when a broken member is to be replaced with a new one.

Take a piece of tubing about two inches long

and having an inside diameter similar to the thickness of the cable. Remove about an inch of the insulation and spread out the strands, making sure that they come nearly through the tube. Next pinch the end of the tube over the bared wire in a vise or with a hammer. The opening in the end can be drilled to fit over the spark plug terminal or cut with transverse or longitudinal slots, according to the type of plug utilized.

### LOCATE A GANG OF THIEVES.

#### Police in St. Louis Succeed in Making Several Arrests for Stealing Cars.

For a number of months the industry has been convinced of the existence of an organized band of automobile thieves, who steal machines, disguise them by changing or obliterating the factory number, etc., and sell them in the smaller

Fig. 3—Showing Components Utilized in Adjusting Clutch of Model T Ford.

towns of the country. There has been more or less difficulty in securing evidence sufficient to convict in many instances, but the police of St. Louis, Mo., appear to have succeeded in apprehending a number of those responsible for such thefts in the Middle West.

Soon after the Automobile Club of St. Louis offered a reward of \$150 for the arrest and conviction of those responsible for the theft of some 25 or 30 machines in that city during the last few months, eight arrests were made. Three convictions already have resulted from the crusade, which not only revealed the hiding place of those responsible for the thefts, but the existence of "fences" in the smaller towns of Missouri and Illinois, through which disposition of the stolen machines was made. Tools and equipment for making the desired changes in appearance and numbers also were located.

gress of March 3rd, 1879.

## SPENDING AND SAVING.

There is an old proverb which reads, "Spend not where you may save; spare not where you must spend." It is very evident that the two sections are intended to be considered together, and the second portion is quite as important as the first. In fact, it almost may be said that he who spares not where he must spend, is not called upon to spend except where he may save.

Manufacturers of recognized standard articles have a reputation to maintain. Standard articles have become recognized as such because of the demand which has been created for them through extensive advertising campaigns. It follows that the goods which are best known are those which have been advertised best. In pur-

chasing these goods the consumer is protecting his own interests, since he cannot fail to appreciate that the maker has quite as much at stake.

The motorist who lays the emphasis upon the saving, in considering the first cost only, entirely overlooks the second clause in the proverb. The possibility of substituting goods of inferior quality for those of a recognized standard has its inception in increased profit for somebody, and the purchaser may be assured that he is not the one to profit thereby. It not only pays to advertise, but it pays to buy advertised goods.

## MOTOR TRUCKS AND ROADS.

That organized motorists should openly advocate the passage of legislation detrimental to the industry is difficult to believe, yet officials of the New York State Automobile Association are credited with stating that they will work for the enactment of a law limiting the weight of commercial motor vehicles. It cannot be contended that this position represents the opinion of the large body of motorists in New York State.

The movement had its inception in Massachusetts, where the state highway commission urged a law of this character early in 1912. In its latest report this commission renews its suggestion, but in a carefully prepared statement concerning highway conditions in that commonwealth, horse drawn vehicles are credited with having worked the greatest harm to improved roads. In at least one instance cited, when motor trucks were substituted for horses, the road was found to need patching only after three years of service.

The interest in good roads methods, which has become so widespread during the past few months, indicates that the general public is giving this subject the attention it deserves. The automobile is a practical conveyance. This is exemplified most directly in the mechanical transport. Its use means industrial progress. The time must soon come when highway authorities will direct their efforts toward meeting the issues squarely, instead of seeking to delay the inevitable.

Organized motorists would do well to study the proposition in all of its ramifications before taking action that may work decided harm to the industry they presume to represent. And those who have purchased motor trucks in good faith certainly have some rights that must be respected.

## OVERLAND TO BUILD BUT ONE CHASSIS.

**F**OR the season of 1914, the Willys-Overland Company, Toledo, O., maker of the Overland, will offer but one chassis instead of two as formerly. The production plans include more cars than heretofore, and the standardization of parts and manufacturing in quantity has made it possible to reduce the price. The new chassis will be known as model 79, to which will be fitted three types of bodies, a five-passenger touring, a two-passenger roadster and a coupe.

The new chassis is similar to the 1913 model 69, but a number of changes are noted, these being practically in dimensions, as the Overland characteristics of mechanical design are retained. The motor is somewhat larger, the bore having been increased to 4.125 inches, although the stroke is

I beam type, is solid, and in assembling, the wristpin is passed through the opening in the piston wall, thence through the bearing bushing in the upper end of the rod. The connecting rod lower bearings are 1.75 inches in length. The camshaft is carried in three bearings.

The intake manifold has been redesigned, having a smaller diameter to compensate for the lower volatility of the gasoline, and yokes replace the flange method of retention. The inlet water manifold, however, is secured with flanges. Pressed steel is utilized for the lower crankcase, but the design remains the same. The three point suspension is continued.

The oiling system has been improved by the adoption of the constant level splash method, a

**Overland Model 79, Five-Passenger Touring Car, Having Attractive Body Lines, New Type Fenders, Deep Upholstery and Roomy Body.**

the same, 4.5. It develops approximately 35 horsepower. It is of the L head type, with individual cylinders and with the valves on the left. A change is noted in the valve mechanism, a new type of valve plungers being utilized, these having a yoke or dog, which bolts at its centre to the crankcase and retains two plungers for each cylinder. By displacing these drop forged yokes the pushrods may be removed without disturbing the camshaft. Quiet operation of the rods is assured by the use of bronze caps fitted over their tops.

The crankshaft is supported by five plain bearings, and the rear member is nearly twice the length of the others, being 3.125 inches. The lower connecting rod bearing caps are secured to the other half of the bearing by one bolt. The small end of the connecting rod, which is of the

gear driven pump supplying lubricant to the connecting rod troughs through four leads. From the troughs the oil flows into the bottom of the crankcase, where it is filtered, thence to a sight feed on the dash and to the troughs again. The excess of lubricant from the cylinder walls and interior of the motor, drains to a strainer, through which it passes before reaching the reservoir. A model R Schebler carburetor is fitted.

Thermo-syphon cooling is utilized, the same type of radiator being employed as was used on the model 71, but the inlet and exhaust water manifolds are larger. The fan belt is V shaped, instead of flat, and adjustment of its tension is by an eccentric mounting of the shaft carrying the fan and pulley. The eccentric bracket is attached to the crankcase. Ignition is by a dual system, a Splitdorf magneto, dry cells and a coil. The

**Overland Two-Passenger Roadster, Having Cowl Dash, 114-Inch Wheelbase and Baggage Carrying Compartment at Rear.**

frame rail instead of to the cross member as formerly. Both are cut from drop forged blanks and the gear is adjustable to four positions. The steering column is larger and the wheel has been increased to 18 inches in diameter. A lever for controlling the air of the carburetor is mounted on the column below the wheel. The usual cut-out is discontinued. It is fitted to order, however.

leather faced cone clutch with adjustable stop is continued.

Drive is by shaft, which is enclosed in a torsion tube yoked at its forward end, its two arms being hinged to the frame cross member to compensate for varying axle position with respect to the frame, as the tube is bolted to the gearbox at its rear end, and the last named component is rigidly bolted to the axle housing. Radius rods are also employed. Drive is through the torsion tube and springs. The universal joint is considerably larger than that used on model 71, and the ring and slip joint is made entirely from drop forged parts. It may be removed without disturbing other components.

The transmission is located at the rear and bolts through flanges to the axle housing and to the torsion tube. It is of the selective type, providing the three conventional forward speeds and a reverse. The main and countershaft assembly is constructed as short as possible, eliminating opportunity of springing. Imported annular ball bearings are employed throughout.

The rear axle is of the three-quarter floating type and Hyatt high duty roller bearings are utilized. The inner end of the axle shaft floats and the outer bearing is mounted outside of the axle housing, so that the shaft is subjected to no other stresses than of driving. A special thrust bearing takes care of side thrust, and is located at the inner end. The brakes are conventional, of the expanding and contracting type, acting on the wheel drums. The drum diameter is 13 inches, an ample braking surface. Equalizers are fitted.

Steering is by means of an adjustable worm and gear, with the housing anchored to the side

beam section type, a drop forging with integral yokes and spring seats. The steering arm knuckles, tierod ends, etc., are also drop forged. Timken roller bearings are fitted to the front wheels. The sliding accelerator is replaced by the push type.

The frame is of pressed steel and is made heavier, due to the lengthening of the wheelbase four inches. It has been increased from .15625 inches to .1875. Semi-elliptic springs are utilized in front, three-quarter at the rear, all spring ends having bronze bushings and compression grease cups. Although the wheelbase has been increased, the hood has been lengthened but .75-inch and improved fasteners are noted. Right hand drive with centre control is retained.

The fenders are crowned and rivetless, a new design and one adding to the attractive appearance of the car. The rear fenders follow the line of the wheels, while the front members slope away with a reverse curve to meet the long running boards, which are noticeable for their clean appearance.

With the exception of .75 inch, the increase in wheelbase has been given the body, the sides of which are slightly higher. The doors have been changed, they now being of full U shape. The

**Chassis of the New Overland, Having Same Characteristics of Mechanical Design as the 1913 Models.**

**Power Plant of New Overland, Showing Method of Retaining Manifolds, New Retention of Valve Plungers and Location of Gray & Davis Lighting and Starting Units Driven by Silent Chains.**

thickness of the upholstery has also been increased. All hinges are concealed. The five-passenger touring body is finished in dark green with light green striping, and nickel and aluminum trimmings. At the rear of the front seats is fitted a protector strip to prevent injury to the finish by the passengers' feet.

The roadster body is an attractive design, also having a cowl dash and with a 32-gallon fuel tank at the rear. Instead of the sloping deck is a large steel tool compartment. The windshield braces extend rearward instead of toward the front. The tops are hooked to the side light brackets, leaving the front of the car unencumbered and adding to its appearance when the top is in position. The touring car and roadster are equipped with an electric horn, Stewart speedometer, clear vision ventilating windshield, mohair top, side curtains and boot, tools, jack and pump. Current for the electric lights is supplied by a storage battery of ample capacity, and an ammeter is standard equipment. Both models have rear vertical tire carriers.

The Overland coupe comes equipped with the Gray & Davis electric lighting and motor starting system. It accommodates four passengers, all facing forward, the driver's seat being slightly in advance of the others. The upholstery is Bedford cloth and the upper portions of the body are in natural wood finish.

A covered compartment at the rear of the driver provides room for storage of articles. The body is made attractive by the use of plate glass sides, round and sashless, at the right and left of the windshield.

The Gray & Davis system is supplied at a slightly increased cost on the touring and roadster models. This comprises two units, a generator and a motor, which are mounted on brackets integral with the crankcase, and are driven through silent chains. The Gray & Davis system has been described fully in these columns.

### BOSTON SHOW DATES.

**Dealers Will Make Display of Both Pleasure and Commercial Car Lines.**

Although the Automobile Chamber of Commerce, as the national association of automobile manufacturers is now known, has decided to abandon the exhibition of motor trucks and business wagons, the people of New England and the East will have opportunity to study the merits of the various productions in this line at the 12th annual Boston automobile show.

As has been true during the past few years, this exhibition will follow that of pleasure cars in Mechanics building. The pleasure vehicle section will be held under the auspices of the Boston Automobile Dealers' Association, March 7-14, while the trucks and business wagons will be shown under the auspices of the Boston Commercial Motor Vehicle Association, March 17-21. Both shows will be under the personal management and direction of Chester I. Campbell.

**The Three-Quarter Floating Type of Axle Is Continued and the Frame Has Been Increased in Size.**

## WITH THE MOTORING INTERESTS ABROAD.

### Boillot and Peugeot Create New Record in Winning Fifth Annual Mont Ventoux Hill Climb--Mea Magneto Victorious in Ireland--Foreign Notes.

**S**TILL further establishing its reputation as a winning combination, Georges Boillot and a Peugeot car took the annual Mont Ventoux hill climb in France, Aug. 24, creating a new record for the course. The "hill" comprises about 13 miles of steep and tortuous grades. Boillot covered the distance in 17:38, reducing his own mark of 17:46, set last year. Incidentally, it may be remarked that this is the fifth time in as many years that the Mont Ventoux event has been taken by the same machine as that which finished a winner in the French Grand Prix, although it must be remembered that these five times were not in succession, since there was no Grand Prix some years.

The other class winners and their times were:

Lacre Police Patrol in Service in Glasgow, Scotland.

Marsaglia, Aquila Italiana, 21:52; Argentina, Aquila Italiana, 22:58; Gaste, Vermorel, 26:28; Riviere, Metallurgique, 26:42; Juvanon, Schneider, 28:17; Gehin, Peugeot cyclecar, 31:30.

#### LACRE POLICE PATROL.

#### Some Particulars in Which British Product Differs from American.

The accompanying illustration will serve in a measure to indicate some of the points in which the motor driven police patrols made in England differ from those produced in this country. The machine is the product of the Lacre Motor Car

Company, Ltd., Letchworth, England, and is one of the first to be supplied to the Glasgow Corporation, which conducts the municipal affairs of Glasgow, Scotland. The chassis is that of the regular 30 horsepower Lacre, on which the company installs its two-ton truck bodies, and it also is used for ambulances, mail wagons, etc.

It will be noted that the exterior of the body is without windows. Prisoners are placed in cells along either side of a corridor extending from the back of the driver's seat to the door at the rear. Ventilation is provided by barred openings near the top of the cells in the roof over the corridor and in the rear door. Two steps lead from the ground to a landing at the rear and on either side of this platform is a seat for an attendant. Other policemen may be accommodated beside the driver or along the running boards at the side. This type of vehicle not only serves as a patrol wagon in making arrests, but is used as a prison van, the cells being arranged so that it is possible to transfer dangerous criminals or even insane persons without danger to themselves or others.

#### WHAT IS A CHAUFFEUR?

#### British Motorists Undetermined as to Whether He Is a Servant or a Mechanic.

It hardly will be contended that American motorists will be concerned over the legal status of a chauffeur, but the subject appears to be of serious moment, just at present, in Great Britain. In June the county bench at Canterbury, England, was called upon to decide whether a chauffeur is a domestic or menial servant entitled to a month's notice on dismissal, or a mechanic who can be dismissed on a week's notice. The bench decided in favor of the latter definition, and the following comment of a legal adviser in a recent issue of the Autocar, a British motoring print, will prove of passing interest, at least:

It would, of course, be impossible to show that a motor 'bus driver was a domestic or menial servant, but a coachman is if he "lives in," and it seems to me that a chauffeur is on the same footing. In Mahaffy's "Law of Motor Cars" the matter is referred to as follows: "It is now a settled custom that in the case of domestic or menial servants one month's notice is sufficient. It is a little difficult to say whether a chauffeur is a domestic (menial) servant or not, since it has yet to be decided,

but it is here submitted that, inasmuch as a huntsman and a head gardener living upon the estate have been held to be menial servants, and therefore only entitled to one month's notice, a chauffeur must also be included in this division."

After quoting a case showing that to be a domestic or menial servant, the service must be of such a domestic nature as to require the servant to be frequently about his master's person or about his grounds, the writer before mentioned adds: "By the same reasoning a chauffeur is engaged about his master's garage, and driving his master or his family from place to place. It is thus hard to see how a chauffeur can be anything but a menial servant."

In another case, menial servants are defined as those persons whose main duty is "to do actual, bodily work as servants for the personal comfort, convenience, or luxury of the master, his family and his guests, and who for this purpose become part of the master's residential or quasi-residential establishment."

### MOTORING IN IRELAND.

#### Mea Magneto Shows Up Well in Recent Cross Country Endurance Trials.

Within the past few months there has been decided interest in motoring and automobiles in Ireland. The roads in the northern part of the island are particularly good, the British government having done much to place them in better condition during the past year.

That the Irish people are giving unusual thought to the subject is evidenced by the fact that one of the exhibits at the recent exposition of the Industrial Development Association in Belfast was a Belfast made 12-16 horsepower touring car, seating five persons and quoted at \$1680 without hood, windshield, tires or lamps. The motor was a four-cylinder unit, with 3.375-inch bore and five-inch stroke, and the car is said to have demonstrated its ability under severe tests.

Another evidence of the growing popularity of the motor car is found in the recent cross country endurance trials held in the hills of Craiganlet, in which the two first prizes went to a Gregoire and a Nom. Both of these machines were fitted with Mea magnetos, a source of some little satisfaction to the Marburg Bros., New York City, American distributor for this make.

### KEROSENE ON WORLD TOUR.

#### Wisconsin Students Now in Great Britain with Their Henderson Car.

Edwin Kohl and Klaus Bergenthal, University of Wisconsin students, who some time ago announced their intention of touring the world by automobile, starting for New York City from Indianapolis, Ind., on July 1, simultaneously with the Pacific Coast tour of the Indiana manufactur-

ers, have arrived in England. They will tour through that country, Scotland, France, Germany, Switzerland, Italy, Russia, China, Japan, and sail from the latter country for San Francisco. They expect to arrive in Indianapolis in about a year, after having covered approximately 27,000 miles, about 6000 of which will be water travel.

They are driving a Henderson car, made by the Henderson Motor Car Company, Indianapolis, and an interesting feature of the trip to motorists, in view of the high cost of gasoline, is the fact that kerosene will be used as fuel, owing to the equipment of Henderson machines with kerosene-burning carburetors.

### NEWS NOTES FROM FOREIGN LANDS.

R. N. Kelsey started recently from Cape Town, South Africa, for a drive across country to Cairo, Egypt, in an Argyll car with single-sleeve engine, made by Argylls, Ltd., Alexandria, Scotland.

It is reported that in the recent Grand Prix race at Le Mans Bosch magnetos and spark plugs were used in the first seven cars to finish. A Bosch magneto and Bosch plugs also were fitted to the Gregoire car, which won the Coupe de la Sarthe.

The Nachrichten fur Handel of Berlin, states that the employment of motor cars in the north of Spain is becoming more popular. A great many pleasure cars are being sold, chiefly of French manufacture. There are excellent openings in Galicia and Asturia, provided the business is entrusted to capable agents. The gasoline sold in the Spanish market is not very pure. The roads are good and a good trade in motor vehicles might be built up if proper attention were paid to local conditions.

There are 1269 automobiles and motorcycles registered in Nova Scotia. In September, 1912, there were only 971 registered. The Nova Scotian government's programme with regard to roads is not confined to one county, but includes every municipality in the province, and will probably be carried out annually over an extended period. Nova Scotia will have in four or five years roads that will be as good, if not better, than any in Canada.

The Coupe de L'Auto will be run over the Boulogne circuit Sept. 21 and to date the entries have been encouraging, as some of the best drivers in the world are included. There will be three Peugeot machines in the race, two of them being driven by Boillot and Goux; two Delage cars, driven by Bablot and Guyot; four Koechlin's, one being driven by A. G. Koechlin; two Buicks, one driven by Repousseau; three Th. Schnelder; two Zenias, one driven by Briand; two Sunbeams, driven by Chasagne and Resta; two Aldas, one driven by Tabuteau; two Vauxhalls, one driven by Hancock, and one Anasagastt, driven by d'Avaray.

Of the 45,000 people in Aden, Arabia, probably 300 are Europeans, comprising in most part, English army officers, city officials and merchants. Probably 75 per cent. of the Europeans have sufficient income to permit the purchase of inexpensive motor cars. There are 16 motor cars in Aden, of which number six motor 'buses are practically useless. There is one 3.5-ton French motor truck. Only two of these cars are American, but one owner proposes to introduce six Ford machines as public vehicles and has already ordered two. The people there did not formerly take to the low-priced American cars, but of late have conceded their merits. All machines in Aden have been introduced since 1910. Only two or three are sold annually. Their use is largely restricted to about 20 miles of road and this and the climatic conditions make it impossible to push the sale of automobiles with any degree of success.

## CORRESPONDENCE WITH THE READER.

**Flywheel Motor Starters.**

(1639)—I note in an advertisement of a certain car I am interested in, that the motor starter and generator is contained with the flywheel; that it is the U. S. L. system. Is it the same type as that fitted to the Ford, and how does the system operate? Do you consider it as good as some other systems where the generator and motor starter are separate units? Is the U. S. L. adaptable to any car? What is the difference between one and three-wire systems? C. A. S.

Savannah, Ga., Aug. 26.

The system referred to is manufactured by the United States Light & Heating Company, New York City, and in addition to starting the motor and lighting, may be utilized for ignition as well. It differs from the Ford in that it generates a direct current and therefore can be utilized for charging the cells of a storage battery. The output of the U. S. L. is so regulated that the proper charging rate is maintained; that is, a regulator is

Fig. 1—Illustrating the U. S. L. Flywheel Generator and Field Secured to Crankcase of Motor.

utilized for control. The current generated by the Ford device is alternating and cannot be employed for charging a battery, although it is used for lighting purposes.

The U. S. L. has but one moving part, the armature, this replacing and performing the function of the flywheel of the engine. The armature, which is shown at Fig. 1, is bolted directly to the engine shaft flange, while the field or stationary part is secured to the crankcase concentric with the engine shaft. The advantages pointed out in the construction are: Noiseless operation, economy in weight, and the elimination of gears, sprockets, etc., since drive is by shaft.

The regulator mentioned controls the output of the generator, which keeps the battery in a fully charged condition. The cells supply current for starting, and by pressing a button the flywheel device becomes a motor, imparting energy to the crankshaft of the engine. Upon release of

the button or switch member, the motor becomes a generator.

Relative to the second question, it may be said that the U. S. L. is a very efficient system and that the workmanship and material are first class in every respect. Owners of cars fitted with this system have spoken very highly of it to the writer. The system is a manufacturer's proposition.

The difference between one and three-wire systems is explained elsewhere in this issue.

**Sal Soda Solution in Radiator.**

(1640)—I have been experiencing trouble with the radiator of my car getting very warm. The water does not boil, but it gets intensely hot. Have inspected the water pump and oiling system and both work perfectly. Carburetor has not been giving any trouble and the mixture seems to be very good. A friend of mine advised the use of sal soda to clean the radiator. Kindly advise if its use will in any way injure the radiator. C. G. B.

Pittsburg, Penn., Aug. 25.

A sal soda solution properly used will not injure the radiator. The heating is probably due to deposits in the cooler created by the use of hard water containing mineral deposits. In preparing the solution dissolve as much as possible in the water, employing the same amount as contained in the circulating system. After operating the motor, run off the soda and thoroughly flush the cooler with fresh water. It is best to change the water several times to make sure all deposits are carried out.

**Marking Timing Gears.**

(1641)—I am overhauling my motor and find it necessary to remove the magneto for repairs, also the camshaft. The gears are not marked in any manner and I haven't the timing plan, nor do I understand timing motors. What is the best plan to pursue to insure getting the shaft and gear back right? NEW SUBSCRIBER.

Logansport, Ind., Sept. 2.

The gears may be marked easily by removing the housing and by using a prick punch. At Fig. 2 is shown a front view of a motor with the gearcase displaced, and the manner of making the marks is also indicated. It will be noted that two are made on one gear, and that the third is made on the tooth of the adjoining gear, which meshes between the teeth of the first named gear. The same plan may be utilized if other gears are to be displaced.

**Nickel Steel.**

(1642)—In reading the car stories in your book I notice that some makes use a 3.5 per cent. nickel steel. What is nickel steel and what are its advantages over ordinary steel? CURIOUS.

Manchester, N. H., Aug. 30.

The material is employed in motor car construction in the percentage referred to because it possesses valuable properties, these being: Resistance to cracking, high elastic limit and homogeneity. In such places as axles and shafts are subject to fatigue the higher elastic limit of nickel steel makes for durability and long life, as well as offers great resistance to sudden strains of shock.

#### Camphor in Fuel.

(1643)—Is there any advantage in using camphor in the gasoline? A friend of mine, who claims to have considerable knowledge of automobiles, states that much more power is derived by its use. SKEPTICAL.  
Boston, Sept. 3.

According to tests conducted by an English engineer, there is no advantage in the use of camphor in the fuel, and some who have tried it state that they believed that a loss in motor efficiency was discernible. The tests referred to were conducted with two machines, a 10 horsepower Star and a 25 horsepower Vauxhall, having a wide difference in power and weight. The trials took place on a long, fairly steep incline.

A mark was made at the bottom of the grade and another at the top. The incline was sufficiently steep to cause both motors to labor when picking up on the high gear. The bottom mark in all tests was passed at a fixed speed noted on the speedometer and the rate was also observed at the finish. The tests resulted as follows:

First test, using gasoline only in the Vauxhall, the bottom mark was passed at 10 miles an hour and the car accelerated until the top was passed at 30 miles an hour. The test was repeated to make sure that the result was the same. The second test was with the same machine, but the fuel contained one-quarter ounce of the best known camphor to each gallon of fuel. There was no difference whatsoever in the car's accelerating powers on the hill, and there was no difference in the motor's running slowly or in its tendency to knock when the spark was advanced. The third test was with the Vauxhall with the gasoline camphorized to the extent of half an ounce in a gallon of gasoline, and the results were exactly the same. The same tests were made with the smaller car with similar results as to efficiency.

Economy tests were also held and it was found that the car ran further with gasoline than with the camphorized fuel. Speed tests resulted in similarity. The engineer in concluding his remarks states, "Motorists wishing to use camphor in the fuel should bear in mind that the cost a gallon is increased and efficiency is not increased." It would appear from the above that camphor does not add to the power of the motor.

#### Piston Clamp and Valve Seating.

(1644)—I read an account of how to make a piston clamp in one of your books, but it is not quite clear how it can be made as I am not much of a mechanic. If you could supply a sketch showing the clamp and how it is used it would be a great help. I notice that you frequently have drawings in answer to questions asked by your readers. The valves on my motor are in bad condition and grinding does not seem to help much. What is the best thing to do, buy new ones?  
W. A. C.

Hillsgrove, R. I., Sept. 3.

The piston clamp referred to is shown at Fig. 3 B and it will be noted that the ends are turned over as suggested in the article describing its manufacture. The method of using the clamp is shown at A, it being gripped by a pair of pliers after it is slid over the ring. Compressing the clamp likewise compresses the piston ring and permits the cylinder to be slid over easily. It is best to have one person operate the pliers and clamp device while another slips the cylinder on the piston. The sketch shows the clamp being

Fig. 2—Showing How Timing Gears Are Marked to Insure Correct Replacement in the Overhaul.

used on the bottom ring, this being merely to illustrate its use. In service the top ring is first compressed and the cylinder slid over, the remaining rings being fitted in sequence.

The valves are probably worn to a condition similar to the member shown at C. The remedy is to reface them and unless you are familiar with the work it is best to have it performed by an expert, although a valve seater could be procured and employed. At D is shown a method of refacing valves by utilizing emery cloth. A hole is cut in the material and the valve slipped through and rotated. Under the circumstances it would be best to consult an experienced repairman and the cost of placing the valves in first class condition should not be prohibitive.

#### Mora Motor.

(1645)—I am having oiling trouble with the motor of my car. It is a Mora and as the company has gone out of business I am unable to obtain any information as to

the system. Some one told me that the engine was made by the Continental people. Any information would be appreciated.

C. P. T.

Charlestown, R. I., Aug. 28.

The Continental Motor Manufacturing Company, Detroit, advises the writer that it has no record of ever making a motor for the Mora company. Perhaps some of The Automobile Journal readers who own Mora cars will supply data as to the cause of the lubrication trouble.

#### Storage Battery Trouble.

(1646)—Can you inform me what is the trouble with my storage battery? It is a six-volt, 40 ampere-hour. After having it charged it shows 6.25 volts, but after using it a few days in the car for ignition it falls off to about four volts. The charging man says the battery has outlived its usefulness and that it would be cheaper to buy a new one than to have it overhauled. The battery has given good service for over three years.

J. D. W.

New Haven, Conn., Sept. 5.

## CARE OF BALL BEARINGS.

### New Departure Manufacturing Company Issues Book of Valuable Suggestions.

Bearings in a motor car are most important components and the aim of the designer is to eliminate all friction and thereby avoid loss of power, a decided factor in the operation of a car. The repairman is often called upon to replace, adjust and clean ball bearings and the work requires a thorough knowledge of the construction and operation of the bearing if satisfactory results are to be obtained.

The New Departure Manufacturing Company, Bristol, Conn., maker of New Departure ball bearings, has compiled a manual which should be in the possession of every mechanic, repairman,

Fig. 3—Showing the Construction of a Piston Clamp (B) and Method of Operation (A)—C and D, Valve Requiring Refacing and Use of Emery Cloth for Resurfacing.

The fact that the charge does not hold indicates that there is trouble with the plates and these may be badly sulphated, buckled, or the cells full of sediment. The cost of overhauling it would hardly pay and it would be better to purchase a new one as the battery man recommends. If the maker maintains a service station within a reasonable distance, the battery might be sent for inspection and an approximate estimate secured as to the cost of putting it into serviceable condition.

John McCann, driving a 22 horsepower Metz car, made by the Metz company, Waltham, Mass., was a class winner in the recent hill climb at Richfield Springs, N. Y. This is the same make of car which won the Glidden trophy.

owner or operator of an automobile. It contains valuable suggestions for the best methods of removing and installing ball bearings, their lubrication and enclosure. The importance of proper maintenance, including cleaning, is defined, and a large number of illustrations make clear the points emphasized, and the book should prove of decided value as a work of reference.

The book is written in a clear, concise manner, free from technical expressions, all explanations being couched in such simple language as to be easily understood. The brochure also contains description and dimension data on all types of bearings made by the company. The book will be sent free of charge by applying to Department D of the New Departure Manufacturing Company, Bristol, Conn.

## IMPROVED ROADS AND MOTORING LAWS.

### Massachusetts Highway Commission Finds Horses Work the Greatest Damage-- What National Associations Are Doing--Brief Legislative Items.

**I**N VIEW of the position taken by the Massachusetts highway commission with reference to limiting the weight of motor trucks using the highways in that commonwealth, it is of interest to note some of the findings of this board in its annual report, just published. The volume covers 330 pages, and at the risk of omitting some of the points which tend to bear out its assertion that truck weights should be limited and that commercial vehicles should pay a larger license fee, the following is quoted:

The traffic study shows that it is not the number of teams, but heavy teams—two or more horses, and heavy loads on narrow tires—that cause the failure. The failure of roads treated with heavy oil has occurred on a few miles of road at certain places where it was clear that heavy horse drawn teams were responsible.

In two instances it was 50 to 75 ice teams a day, together with the other teams, carrying three tons or more each on 2.5 to three-inch tires. In a month the oil surface began to crumble and break up on the side of the road on which the loaded teams travelled. It lasted three months on the other side of the road, where these teams came back empty. This same road, treated with the same oil, is still in good condition beyond these ice houses; in one case for three miles, in the other for 15 or 16 miles, and the oil is three years old and still only needs patching.

One more instance of interest: The Gloucester state highway covered with a hot oil blanket was rutting and wearing out rapidly in 1909. A coal team was passing to some hotels three or four times a day during the summer, carrying six or seven tons of coal on narrow tires. A motor truck was substituted for the coal team, and the surface of the road, which had been oiled, was again in good condition. It has worn three years and now only needs patching.

### LINCOLN HIGHWAY ASSOCIATION.

#### Aims and Purposes Set Forth in Statement to Governors' Conference.

In order to prevent misunderstanding and to show what the Lincoln highway will be from a national viewpoint, Henry B. Joy, president of the Lincoln Highway Association, addressed the following declaration of plans and ideals to the conference of governors held in Colorado Springs, Col., beginning Aug. 28:

With the authority to plan and the power to execute of the great Napoleon, the Lincoln way might be creditably planned and executed with dispatch from the beginning. Many cities want it to pass their way. Many counties seek that it traverse them, and even great states press for the benefits which will accrue from its passing through.

The idealists who have energetically pressed forward the great project of a Lincoln highway from coast-to-coast have accomplished wonders toward crystallizing a nation-wide demand for the consummation of such a

great and desirable project. A committee of these idealists, after energetically and at their own expense pressing the propaganda to national fame and interest, decided to increase the force behind their efforts, enlist the financial aid of others and thus develop a stronger interest and support of the propaganda.

After much deliberation, they decided to centralize and organize with headquarters at a convenient centre. Some of those whose counsel and enlistment in the work they sought were at first unbelievers—scoffers at such a colossal and impossible project. Be it noted that each and every one approached to aid in forming the permanent association after careful investigation of the merits and possibilities of the project enlisted in incorporating under the laws of Michigan the Lincoln highway, with headquarters in Detroit. The name received finally, out of scores suggested, the unanimous approval of all.

The association then set out to get the consent of all transcontinental highway organizations to the use of the name Lincoln highway. This was willingly conceded in a broad spirit with promises of co-operation and pledges of active support towards whatever might be the trend of the studies and investigations as to route.

Route investigation began. All data were studied and climatic conditions considered. Routes possible and impossible were travelled, and details carefully noted as bearing on the ultimate decision which the Lincoln Highway Association was organized to make as to what route would in its judgment be the most practicable to become the great Lincoln memorial highway.

The Lincoln highway, so selected, if done wisely, will become great. None knows better than those who will assume to select the route that it is not done with Napoleonic authority or power. The force behind the decision will be only the wisdom of it, which it is hoped will give the selection of route the force of Napoleon's dictum. Yes, even a greater force, because it is believed that the route of the Lincoln highway, wisely chosen, will have behind it the patriotic force of the whole people.

The appeals of sections have been heard. The arguments of all interests have been and are being weighed. Shall the Lincoln way be marked on the map from large city to large city? Shall it be from point of interest to point of interest? Shall it be a highway from New York to San Francisco as direct as practicable considering the limitations by nature in the topography of the country?

See America first! With all our force we endorse that sentiment. But a transcontinental highway that would from large city to large city, from one wonder of nature to another, from a memorable battle field to a birth or resting place of a martyr President would indeed be a devious and winding journey in this great America of ours.

It becomes plain that the decision on such a devious and complicated route could not be arrived at in two generations. No concentrated effort could be gained for the execution of the work. It becomes plain that the scope of the work must be within the practicable. It must be such as to immediately upon presentation gain your support and mine.

Then, next, to obtain action, a plan is necessary. To have a plan, decision is necessary. For decision, the hopeless divergence of conflicting interests and opinions must be eliminated, and practical conditions only must be considered. The decision must be confined to one permanent road, across the country, to be constructed first, no matter how desirable others may be and actually are.

Such has become the basic principle guiding the Lincoln Highway Association. It is seeking to decide wisely a matter which must be decided rightly; in order to eliminate the petty hauling and pulling and opposition which would be fatal to the great patriotic work, and which would thus postpone beyond our vision so laudable a project. It seems but yesterday that the Panama canal was begun, and yet almost but tomorrow it will be open to the world. Without dreams the world would accomplish little.

## NATIONAL HIGHWAYS ASSOCIATION.

### Many State Governors Actively Interested in Promoting Its Plans.

In connection with the meeting of the House of Governors in Colorado Springs, Col., last month, it is of interest to note that one of the governing bodies of the National Highways Association, the organization which is advocating the construction of 50,000 miles of national highways by the United States government, is composed of past and present state governors. The board now numbers some 50 men, including the following:

O'Neal, Alabama; Hunt, Arizona; Johnson, California; Ammons, Colorado; Miller, Delaware; Trammell, Florida; Slaton, Georgia; J. M. Haines, Idaho; Ralston, Indiana; Clarke, Iowa; Hodges, Kansas; McCreary, Kentucky; Hall, Louisiana; W. T. Haines, Maine; Goldsborough, Maryland; Foss, Massachusetts; Ferris, Michigan; Eberhart, Minnesota; Brewer, Mississippi; Major, Missouri; Stewart, Montana; Morehead, Nebraska; Oddie, Nevada; McDonald, North Dakota; Sulzer, New York; Craig, North Carolina; Hanna, North Dakota; Cox, Ohio; Cruce, Oklahoma; West, Oregon; Tener, Pennsylvania; Blease, South Carolina; Byrne, South Dakota; Hooper, Tennessee; Colquitt, Texas; Spry, Utah; Fletcher, Vermont; Mann, Virginia; Lister, Washington; Hatfield, West Virginia; Carey, Wyoming; Strong, Alaska; Frear, Hawaii; Colton, Porto Rico, and M. H. Thatcher and Col. Goethals, representing the Panama canal zone.

Already several good roads organizations have amalgamated with this body. The National Oil Trails Association and the Inter-Mountain Good Roads Association have become departments of the national organization and the Ohio Good Roads Federation, the Great White Way Association, the North Carolina Good Roads Association and the Pennsylvania Good Roads Association have become divisions of it.

## ROAD FUND APPORTIONED.

### How the Various Counties in New York Will Benefit from Bond Issue.

John N. Carlisle, state commissioner of highways in New York, has completed the apportionment of the second \$50,000,000, which was authorized in the referendum at the general election in 1912, to be used for the construction and improvement of highways. Under the terms of the vote, \$20,000,000 is available for state roads and \$30,000,000 for county roads, to be apportioned equitably on the basis of population, amount of public highways and the areas of the several counties. These sums have been divided by the commissioner, with the approval of the attorney-general and state comptroller, as follows:

| County       | Apportioned<br>for State | Apportioned<br>for County |
|--------------|--------------------------|---------------------------|
| Albany       | \$427,140.80             | \$640,711.20              |
| Alleghany    | 360,388.80               | 540,583.20                |
| Broome       | 335,741.20               | 503,611.80                |
| Cattaraugus  | 445,184.00               | 667,776.00                |
| Cayuga       | 328,913.40               | 493,370.10                |
| Chautauqua   | 471,615.80               | 707,423.70                |

## EXHIBITORS AT DETROIT.

### Manufacturers and Producers Who Will Make Display at Road Congress.

Plans are progressing favorably for the third annual road congress of the American Highway Association, and affiliated bodies, at Detroit, Sept. 29-Oct. 4. Among the special meetings will be a conference of vehicle makers, horse drawn and motor driven, regarding traffic regulations, having particular reference to the weight of vehicles and tire widths, at the call of George C. Diehl, chairman of the national good roads board of the American Automobile Association. Chair-

man John N. Carlisle of the highway commission of New York State will preside.

A particularly interesting feature of the congress will be the exhibition of road making machinery and materials, in which the following manufacturers and producers will take part:

Acme Road Machinery Company, Frankfort, N. Y.; J. D. Adams & Co., Indianapolis, Ind.; American Car & Foundry Company, Detroit; American Granite Company, Milwaukee, Wis.; American Rolling Mill Company, Middletown, O.; American Steel & Wire Company, Chicago; Austin Western Company, Chicago; Association of American Portland Cement Manufacturers, Philadelphia; Baker Manufacturing Company, Memphis, Tenn.; R. D. Baker & Co., Detroit; Barber Asphalt Paving Company, Philadelphia; Barrett Manufacturing Company, New York City; Bausch & Lomb Optical Company, Rochester, N. Y.; Rudolph S. Blome Company, Chicago; Buffalo Pitts Company, Buffalo, N. Y.; Dolarway Paving Company, New York City; Dunn Wire-Cut-Lug Brick Company, Connecticut, O.; Eureka Machine Company, Lansing, Mich.; Good Roads Machinery Company, Kennett Square, Penn.; Good Roads Supply Company, Detroit; Hastings Paving Company, New York City; Wheeling Mold & Foundry Company, Wheeling, W. Va.; Robert W. Hunt & Co., Chicago; Warren Bros. Company, Boston, Mass.; Chas. Hvass & Co., New York City; Van Duzen, Roys & Co., Columbus, O.; Institute of Industrial Research, Washington, D. C.; Universal Portland Cement Company, Chicago; Iroquois Iron Works, Buffalo, N. Y.; United States Cast Iron Pipe & Foundry Company, Burlington, N. J.; Kent Machine Company, Kent, O.; Knickerbocker Company, Jackson, Mich.; National Paving Brick Manufacturers' Association, Cleveland, O.; Novo Engine Company, Lansing, Mich.; Port Huron Engine & Thresher Company, Port Huron, Mich.; Portsmouth Culvert Company, Portsmouth, O.; Robeson Process Company, Pennington, N. J.; Shannon Self-Locking Metal Culvert Company, Cincinnati, O.; Standard Oil Company, Chicago; Steel Protected Concrete Company, Philadelphia; Tarrant Manufacturing Company, Saratoga Springs, N. Y.; Texas Company, New York City; Thomas Steel Reinforcement Company, Detroit; Trussed Concrete Steel Company, Detroit; United States Asphalt Refining Company, New York City; United States Wood Preserving Company, New York City.

#### LEGISLATIVE BRIEFS.

The license markers in Connecticut during 1914 will carry white letters and figures on a light green background. Instead of a capital C for the state designation, the abbreviation "Conn." will be arranged vertically at the left of the number and the figures 1914 in the same manner at the right.

According to an announcement credited to Robert S. Ross, secretary of the New York State Automobile Association, an attempt will be made to secure the passage of a bill by the 1914 session of the legislature, limiting the weight of truck loads to three tons and to require tires to be of a width proportionate to the maximum weight to be carried.

Montgomery, Ala., has an interesting ordinance, which requires all dealers in gasoline to report to the assistant fire chief daily the names and addresses of customers to whom gasoline has been sold and the amount purchased by each. E. A. Frazer, manager of the Alabama Auto Company's garage, was fined \$10 and costs recently for failure to comply with this provision.

Supreme Court Justice Seabury has vacated the temporary injunctions secured by taxicab companies in New York City against the enforcement of the so-called taxicab ordinance. He holds that the ordinance "must be pronounced a serious and well considered attempt to remedy abuses which have grown to such an extent as to make the application of a remedy imperative." All but one of the companies interested appear to have accepted this decision as final, the exception having established a private taxicab line in an effort to avoid compliance with the regulations.

In order to comply with the new registration law in Pennsylvania, it will be necessary to provide six different classes of license plates. The first class comprises pleasure cars and all others having pneumatic tires; the second, all motor trucks on solid tires, this being sub-divided according to five differing weight classifications, each designated by stars; the third, manufacturers and dealers, carrying an X before the number; the fourth, traction engines, with an E; the fifth, trailers, with a T, and the sixth, motorcycles, with an O.

#### PILOT'S CROSS COUNTRY TRIP.

##### How the Richmond Product Withstood Trials of Indiana-Pacific Tour.

As a result of the performance of the Pilot car, made by the Pilot Motor Car Company, Richmond, Ind., in the Indiana-Pacific tour of the Indiana Automobile Manufacturers' Association, the engineer, who accompanied the tourists, reports there are but slight changes to recommend in the way of improvement. The trip was much harder than was expected, especially through the Colorado mountains and deserts, and the company is much pleased to learn that the strength of its product was such as to meet every road condition encountered. The engineer reports in part as follows:

The trip showed the high quality of tires made by the standard manufacturers, as the Pilot reached San Francisco with the original air in the front tires, placed there at the factory, and we were not obliged to replace the rear tires until the touring party reached Lake Tahoe. In other words, tires gave the full mileage expected in ordinary travel, notwithstanding the difficult road conditions encountered in the trip.

Fuel consumption varied, as would be expected. About eight miles a gallon was obtained in the steep grades in the mountains, and on the ordinary roads 10 to 12 miles a gallon. In a few favored sections, where the roads were exceptionally good, 14 miles a gallon were obtained, which is equal to the best records made by car owners in this vicinity.

On account of the abundance of power in our motor, no trouble was experienced whatever in climbing the steepest grades, even at the highest altitudes, over 11,000 feet, but the trip showed conclusively the great importance and necessity of a carburetor designed especially for the altitudes. A carburetor with an air adjustment from the steering column, which we tried in the mountains, proved of great value.

The tour also showed that all cars sent by manufacturers to the mountains and deserts should have spring steel of the very highest quality and strength to withstand the service there, and particular attention should be given to this matter by all manufacturers selling cars in this territory. To the credit of the Indiana built cars which participated in the tour, it may be said there were few, if any, delays on the road on account of the need of replacements or repairs, due to faulty material or construction, and what few delays there were, were largely due to the roads being made impassable at times by cloud bursts, and over some of these roads, even in their bad condition, speed was made, which only drivers with great confidence in their cars would dare to make.

We naturally feel greatly pleased at the showing of the Pilot in making this long journey without mechanical road adjustments, and the tour will enlighten the public and automobile owners throughout the country as to the general excellence of the Indiana made cars, and the reliability and service which may be expected from any of the cars which met the rugged conditions of this trip so efficiently.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**T**HE advantages of turntables in the garage are numerous. Not only do they permit of utilizing all the floor space, but they make for

**Universal Turntable, Having Ball Bearings and Means for Draining, Is Constructed in Varying Capacities.**

safety, in that accidents due to placing the machine in its proper space on a crowded floor are avoided. This is particularly true where the garage is a converted building and of such dimensions as to compel the driver to make many changes of gears in positioning his car. Considerable time is saved through the installation of a turntable not only in entering and leaving the building, but the washer is able to handle the machine without starting up the motor.

The Canton Foundry & Machine Company, Canton, O., manufactures a wide variety of turntables adapted to both public and private service and in various sizes and capacities. One of the features of the Universal design, shown in an accompanying illustration, is the inexpensive foundation required and the means employed to take care of the accumulation of mud, etc., removed from the vehicle in the washing process. The pit is but 12 inches deep, a concrete base, slightly larger than the turntable, and grooved so as to carry all water and debris from the centre to the periphery of the table and into a concrete gutter or drain, which is covered with removable plates.

It is held that the Universal operates so easily that it may be turned by a child. This is due to the Serpentine, patented, ball bearing race course, so constructed that foreign elements are prevented from interfering with the movement of the balls. By referring to the lower view in the illustration it will be noted that the top of the table rests on seven balls at the summits, the remaining balls revolving in pockets filled with lubricant. As the table moves the balls at the "high spots" roll and are replaced by others coming up, eliminating friction.

The superstructure is of structural steel built in truss form and reinforced. The top plates are No. 7 gauge steel, securely braced. The table has a checkered iron removable centre with No. 7 gauge steel plates extending to the outer rim, neatly fitted and sloping slightly to provide for proper drainage. The 12 top steel plates are removable and are reinforced by angle irons at proper intervals, firmly riveted crosswise underneath and resting on structural trusses. The table cannot tilt, as the slightest depression throws caster wheels on the outer rim to the rim track.

The Universal is made in 12, 14, 15 and 16-foot table diameters, each having a supporting capacity of 8000 pounds, and 16 and 18-foot diameter tables with capacities ranging from eight to 10 tons for truck service. The company makes a specialty of installations and will submit data and specifications on request.

### F. & R. PATENT VISE.

The Fulton Machine & Vise Company, Lowville, N. Y., is manufacturing the F. & R. patent vise in the machinist's pattern. It has the advantage of two complete swivels, a combination of the two giving the most desirable positions for the use of a mechanic. The vise, which is presented in an accompanying illustration, is locked at any angle by two separate methods. One is by clamping the work within the jaws, which tightens the frictions, the other by the use of the position pins. With both in use it is stated that the vise is positively locked in any position. The

**F. & R. Patent Vise Especially Adapted for Motor Car Repair Work.**

jaws are always held in place, when the work is removed, by the position pins, if the operator requires, by the use of which the vise is made sta-

tionary at any angle. Cast steel faced tempered jaws are utilized. The vise is made with openings varying from two to nine inches and in six sizes, the weights varying from 6.5 to 155 pounds.

### EDWARDS PORTABLE TIRE PUMP.

The Edwards Manufacturing Company, Cincinnati, O., is producing the Edwards portable electric tire pump shown herewith. It is designed both for public and private garages, is simple in design, and throughout the best of material and workmanship are employed. The motor, compressor and tank are mounted on a neat base having three wheels and a convenient handle. The air tank is 12 inches long and six in diameter, and is equipped with a petcock at the bottom, permitting of blowing out any condensation that may exist, also for pumping into the tank direct.

The motor is a .5 horsepower unit, constructed for either alternating or direct current, 110 or 220 volts, 60-cycle, single-phase. The compressor is of the air-cooled type, geared to the electrical unit, with pinions fully enclosed. Eight feet of high grade .5-inch hose with gauge, tank pressure gauge and 20 feet of electric cord and socket are included in the equipment. The switch is located on the motor. Lubrication is provided by means of grease cups on the cylinder and crankshaft bearings. It is stated that the outfit will pump a 34 by four-inch tire from flat to 70 pounds in 90 seconds. The weight of the equipment is 130 pounds. The company issues a catalogue on portable tire power pumps, grinders, drills, etc., which will be forwarded on request.

### NEVER LOOSEN LOCK NUT.

L. L. Swenson, Ottuma, Ia., has invented a lock nut device, termed the Never Loosen, which comprises a split nut having threads for engagement with the bolt threads and adapted for binding engagement on the face of the nut proper, preventing turning of the nut. The locking action is secured by the twisting of the locking nut before the threads are cut. The nut proper is constructed of hardened tempered steel so that when applied to the bolt it will have a tendency to resume its normal shape, thereby locking both the nut and the bolt.

### VULCAN CHAIN PIPE VISE.

J. H. Williams & Co., 150 Hamilton avenue, Brooklyn, N. Y., is manufacturing the Vulcan

chain pipe vise, which is constructed of bright steel throughout and is claimed to be unbreakable. It is also compact in design and may be set up readily for service. It has drop forged steel jaws, tempered for file sharpening. The vise is made in three sizes with pipe capacities of from .125 to eight inches.

### SCHWARZ WHEEL SPIDERS.

The Schwarz Wheel Company, Philadelphia, is now marketing its wheel spiders, enabling repairs to be made by the garageman. They are adaptable for renovating wheels which have a number of spokes broken, thereby saving time and the cost of shipping the work to the factory. The spiders are constructed with the Schwarz patent spoke, and these spokes, turned, finished

Edwards Portable Electric Tire Pump, a Simple and Compact Outfit.

and assembled, form a complete filling for the wheel, with the exception of the felloe. In repairing wheels, it is stated that all that is required is to cut on the round tenons, and put on the old felloe and metal rim. The spiders may also be used in producing new wheels by simply applying new felloes amid the metal rims. The centre hole to be bored by the hub is left blank. The spiders are long enough to accommodate any size of tire. The company carries a full line of spiders adaptable to practically every type of pleasure and commercial vehicle.

T. A. Goll recently lowered by 1:05:00 the cross country record between St. Louis and Kansas City, Mo. With three other passengers in a Reo the Fifth he covered the distance in 12:55:00, with an actual running time of 11:25:00.

## THE REPAIR SHOP AND THE GARAGE.

### Suggestions for Clamp for Removing Wristpins from Piston--Gear Puller Adapted to Solid and Spoked Wheels--Suggestion for Building Up Bearings.

THE usual method of removing a piston from its connecting rod in the overhaul of the motor is to utilize a piece of brass and a hammer, driving out the wristpin. This is not held to be good practise owing to the walls of the piston being fragile and the possibility of damage through carelessness. In an accompanying illustration is presented a wristpin drawing tool, which was constructed by a driver who cares for several machines utilized by the concern with which he is employed.

Clamp for Withdrawing Wristpins from Piston.

It comprises a clamp as indicated, which is slipped over the piston. The clamp carries a threaded bolt, the end of which is turned down to a point, and engages with the wristpin when this is of the solid type. By using a wrench, a gentle, but considerable, pressure is brought against the wristpin and it is stated that the most obstinate part may be removed without danger of injury to the piston. When constructed for the repair shop several sizes of pins could be turned out to meet varying designs of wristpins, including hollow members.

#### INGENIOUS GEAR PULLER.

Many times it is difficult to draw timing gears, etc., from their shafts owing to the lack of a suitable tool. Sometimes the wheel is lightly constructed with delicate spokes and to attempt to draw the gear with the ordinary tool usually results in buckling or throwing it out of alignment.

In an accompanying illustration is shown a gear puller, the maker of which was awarded first prize in the mechanics' competition conducted by Commercial Motor, an English motoring print.

It is stated by the maker that it will remove a gear without injuring it, as an even pull is obtained at four separate points of the rim when required. This is accomplished by inserting two three-quarter pins through the arms of the top, on which the wheel can be placed.

When the gears are solid and will withstand more strain, the other end of the dog, with the bent-over legs is utilized in the usual manner. When the gear has openings the reversible dog may be used as well. One of the features of the device is that it may be taken apart and stored easily.

#### DETERMINING STEEL.

A method of determining self-hardening steel from ordinary cast steel is to hold the metal against a high speed emery wheel. If the color of the spark given off be bright red, it can be taken for granted that the material being ground is cast steel. If it is a dull red, however, the steel is of the self-hardening brand, and the sparks made are very much like those given off from cast iron.

#### BUILDING UP BEARINGS.

The following suggestion is made by a workman, for adjusting the small ends of connecting rods where considerable play exists: Press the bushing out of position in the vise and sweat a layer of solder onto the outside surface. After

An Ingenious Gear Puller: A. Showing Construction of Device; B. How Four Points of Contact Are Obtained.

pressing the part into position again it will be found to be smaller than before and the wristpin can be refitted.

## MERCER AND STUTZ EACH WIN ONE.

**Ralph DePalma Takes the Chicago Automobile Club Trophy the First Day, and Gilbert Anderson the Elgin National the Next at Elgin Road Meet.**

**T**HE contest for supremacy, which has been waged between drivers of Stutz and Mercer cars since the opening of the present racing season, remains the same as though the two 301-mile events at Elgin, Ill., had not been run. That is to say, each make of machine secured a victory, Ralph DePalma in a Mercer taking the Chicago Automobile Club trophy Aug. 29, and Gilbert Anderson in a Stutz the Elgin National trophy, Aug. 30. By the law, which appears to be governing the destinies of these two, it is the Mercer's turn to win the next long distance event. The Stutz took the one just preceding the Elgin events—the Santa Monica road race.

In some respects the contest for the Chicago

was called before he had time to finish. He was out of the running at one time for 15 minutes, while his mechanic and helpers made necessary adjustments. The other competing cars and drivers were: Mason, Rickenbacher; Mercer, Wishart; Nyberg, Harry Endicott; Mason, Mulford, and Mercer, Luttrell.

Apparently there was no doubt of the result after the 10th lap, except that the two leaders contested every inch of the way. The other cars were too far behind to admit of their affecting the final result under any ordinary circumstances. Mulford was forced to retire in the 11th lap, because of being struck in the face by a stone, said to have been thrown by a small boy in a corn

**Ralph DePalma and the Winning Mercer at the Finish of the Race for the Chicago Automobile Club Trophy, Elgin, Ill., Aug. 29.**

Automobile Club trophy. Aug. 29, was very like the second 500-mile race on the Indianapolis speedway, May 30, 1912. It will be remembered that DePalma in a Mercedes led the field in that event almost from the first, with Joseph Dawson in a National close behind him. When DePalma was forced to withdraw on the next to the last lap, Dawson became an easy winner. This time DePalma was at the wheel of a Mercer and Dawson was driving a Delta. There was no withdrawing on the next to the last lap and Dawson was forced to be content with second place.

DePalma's time for the 301 miles was 4:31:56. Dawson finished in 4:39:52. Third place went to William Chandler in a Mason, although the race

field on one of the back stretches. Endicott's machine caught on fire and he was so badly burned that he was taken to the field hospital. The other machines which failed to finish experienced some little trouble because of the poor condition of the road surface on the west stretch, between McQueen's and the so-called graveyard turn.

Although the race for the Elgin National trophy was for the same distance as the contest of the previous day, the result was somewhat more interesting from the fact that all previous records for the course were exceeded. Anderson's Stutz covered the 301 miles in 4:13:38, his average speed being 71.5 mile an hour, as against 62.5

for Mulford's Lozier in 1910, 66.43 for Zengel's National in 1911, and 68.4 for DePalma's Mercedes in 1912. Mulford in a Mason was second this year in 4:20:31, and Wishart in a Mercer, third, in 4:29:58. Wishart also created a lap record of 6:38.

There were 12 starters as follows: William Endicott, Case; Rickenbacher, Mason; Mulford, Mason; Anderson, Stutz; Wishart, Mercer; Haupt, Mason; Dawson, Marmon; DePalma, Mercer; Burman, Keeton; Henning, Velie; Bergdoll, Erwin; Grant, Isotta. William Endicott was the first to get away and Rickenbacher the last. The latter was forced to retire on the back stretch while attempting to pass his teammate, Mulford.

Anderson took the lead on the fourth lap, and maintained that position throughout the remainder of the race. Mulford went into second place on the third lap, but was forced to contest that position with Wishart many times during

Gilbert Anderson and His Stutz Finishing a Winner in the Elgin National Road Race, Aug. 30, After Creating New Record for the Course.

the next four hours. At one time Wishart had dropped back to sixth place, but despite his frequent stops on account of tire trouble he kept Mulford busy.

Harry Grant showed some of his old form, although the Isotta failed to indicate the desired speed to make him a winner. He drove 250 miles without stopping, finishing in fourth place, and was the only driver in the contest to go through with but one stop. DePalma and his Mercer finished fifth. Of the 12 drivers in the race only three were compelled to withdraw, these being Rickenbacher, Burman and Haupt. The positions of the leaders and their times at various stages of the race follow:

| 50 Miles.  |                |       |

that Bosch magnetos and plugs won a complete victory. Not only were the Mercer that won the Chicago Automobile Club trophy and the Stutz that won the Elgin National trophy, thus equipped, but every car to receive the checkered flag at the completion of the race as well. It is believed that this is the first important racing event in this country, at least, where the same ignition equipment was utilized on all cars to finish.

After reassembling the transcontinental Cole, C. S. Crawford, chief engineer of the Cole Motor Car Company, Indianapolis, Ind., drove the machine to an elevation of 4800 feet toward the summit of Mt. Hood in Oregon. It is claimed that Crawford's trip extended about two miles further over this mountain road than ever had been traversed before by automobile.

# CHARACTERISTICS OF HEAVY FUELS.

## Part II—Effect of Varying Control of Four-Cycle Motor on the Mixture and Methods Involving Variation of the Cycle—Carburetion of Light Oils.

IN THE previous installment reference was made to the result of varying the control with a four-cycle motor and its effect upon the mixture within the cylinder walls, it being stated that varying the amount of the charge and compression was to vary the temperature of compression.

Fig. 3—Indicator Card of Ideal Engine.

To properly understand that which takes place in the cylinder of a four-cycle engine the indicator diagram at Fig. 3 will be of service. It provides a convenient means of showing what occurs within the cylinder during operation, and its name is derived from the fact that such diagrams can be drawn mechanically for real engines by means of an instrument called an indicator. Such diagrams are very useful to the engineer.

### Pressure-Volume.

The diagram referred to is for pressure-volume, and in the explanation it is assumed that the substance in the cylinder is air. At the start of the cycle the piston has completed the firing stroke and is about to begin the intake or suction stroke. The clearance space between the piston and the cylinder head is filled with burned gases (products of combustion), and the pressure is atmospheric because the cylinder has been in communication with the atmosphere through the exhaust valve, now closed. The condition at this time is shown in the diagram by the point A, which is at a horizontal distance above the vertical axis representing the atmospheric pressure of 14.7 pounds a square inch.

Upon the piston making its stroke (intake) the cylinder is in communication with the outside air and the pressure within it remains atmospheric throughout. The intake is represented on the diagram by the line A-B, which is at the constant height representing the atmospheric pressure, and its length represents the volume of the charge taken in, which is the same as the volume through which the piston moves. The point B represents the condition at the end of the in-

take stroke. Both the intake and exhaust valves being closed the air cannot escape and during the compression stroke is crowded into a smaller volume, while its pressure rises. This continues until the stroke is completed and the charge is compressed in the clearance space, a process represented by the line B-C, which shows the rise in pressure resulting from the compression. A compression of this kind, occurring without the addition of heat to or its subtraction from the gas, is called an adiabatic compression. It is a process similar to that which takes place in the operation of a tire pump, and which causes its rise in temperature.

### Cylinder Pressures.

When the charge attains the point indicated by C, it is ignited, and the heat generated by the explosion raises the temperature and consequently the pressure of the mixture. The combustion occurs so quickly that the piston has not time to start on the next stroke (firing) before the combustion is completed, and the rise in temperature occurs as shown by the line C-D, while the volume of the gas is constant. The products of combustion actuate the piston, and expanding behind it, fall in pressure. This expansion taking place without communication to or from the gas, is adiabatic expansion, and is accompanied by a fall in the temperature of the gas.

The expansion curve D-E is similar to the compression curve B-C. At the point E the stroke is completed and further expansion is not possible. Upon the exhaust valve opening the pressure within the cylinder falls to atmospheric, as indicated by the line E-B.

The diagram, therefore, shows the series of pressure and volume changes taking place in a gas engine, and is such as would be taken by an indicator from a perfect engine. The area B, C, D, E, represents the work done a cycle. The rise

Fig. 4—Indicator Card from Otto Cycle Engine.

in temperature during the explosion depends on the amount of heat that is generated, also on the strength of the mixture and the heat of

combustion of a cubic foot of the fuel.

The above deals with an ideal engine, but there are differences between it and the practical or real engine, occurring in each part of the cycle. During the intake (Fig. 4, line A-B), the pressure in the cylinder is

Fig. 5—Indicator Card with Weak Mixture.

approximately a pound or more below atmospheric pressure. The mixture is also heated by contact with the walls of the cylinder and with the hot gases remaining in the clearance space. The compression is not adiabatic, because it takes place in a cast iron cylinder, which absorbs heat from the gas while it is being compressed and thus makes the final pressure and temperature less than that calculated on the assumption of adiabatic expansion, although it is held that the difference is not generally very great.

The combustion is neither instantaneous nor complete. With weaker mixtures the explosion becomes slower and less complete, as indicated at Fig. 5, until with the weakest the process is one of slow combustion taking place practically throughout the period of expansion. Some of the charge may still be unburned when the exhaust occurs. The expansion curve is above adiabatic in motors because the cylinder walls that have been heated by the explosion give back some of the heat to the gases, and also because the combustion continues and liberates more heat. This last effect is more noticeable when the mixture is weak.

While the above discussion may appear foreign to the subject of heavy fuels, it has an important bearing, however, as was pointed out in the opening paragraph of this article.

Fig. 6—Indicator Diagrams for Quality Governing.

demand is termed governing, a function that may be further complicated by the addition of other requirements than the maintenance of a balance

between the energy generated and that demanded. Thus it may be necessary to be able to operate at various speeds while maintaining the above balance, as with the automobile engine. In most stationary engines it is desirable to maintain an approximately constant speed regardless of the power demand; that is, the speed of rotation must generally be approximately the same at all loads. The balance between supply and demand may be obtained manually as with the automobile motor, automatically by suitable mechanism as in the ordinary power engine, or by a combination of these two methods.

The power made available in the cylinder of an engine is dependent upon the net work supplied to the piston by the working substance a cycle and the number of cycles performed in a unit of time. To vary the power made available it is possible to vary the net work supplied the piston a cycle or the number of cycles a unit of time, or both. With the number of cycles a unit of time remaining constant, the power made available may be varied

Fig. 7—Indicator Diagram for Quantity Governing.

by changing the work done on the piston a cycle; that is, by changing the work value of a cycle. This may be accomplished by changing the relative proportions of the fuel and air, known as quality governing, or by changing the weight of constant quality mixture drawn into the cylinder a cycle, which is known as quantity governing.

#### Quality Governing.

Since the internal combustion motor is a heat engine, the amount of work which it makes available in a given time must, in a general way, be proportional to the heat energy supplied it; that is, the quantity of fuel in that time. It follows, therefore, if the energy is to be decreased, it is only essential to decrease the amount of fuel burned a cycle, while an increase in the supply will augment the energy, provided, however, sufficient air be present to burn it all.

A series of indicator diagrams is presented at Fig. 6, these showing the variation in size accompanying a variation in the fuel supply. The area of each cycle is proportional to the work done on the piston during that cycle, and, therefore, is a measure of the power made available. The largest diagram corresponds to the rated load, with

approximately the maximum proportion of fuel in the mixture. The smaller diagrams express smaller loads and proportions of fuel, or, as it is

Fig. 8—Forms of Spray Nozzles: A, Fixed Orifice; B, Adjustable; C, Same with Inverted Needle.

commonly termed, leaner or weaker mixtures.

It will be seen that the compression pressure remains the same for all cycles, indicating that a full charge is drawn in at all loads. Any diminution in the fuel supply is balanced by a corresponding increase in the air supply. Theoretically this is held to be advantageous, as the efficiency of the Otto cycle depends on the terminal compression pressure if the initial pressure remains constant. From a theoretical viewpoint this method of governing should provide a constant efficiency for all loads. Practically, this is not true because as the mixture becomes leaner it burns more and more slowly, as is indicated by the gradual tipping of the combustion lines in the diagram. This results in a greater loss to the jacket water at fractional loads, and ultimately to the exhaust of incompletely burned charges at very slight loads. The efficiency therefore decreases as the load decreases.

#### Quantity Regulation.

When operating at a full load an internal combustion engine draws into its cylinder enough air to practically burn the fuel charge. In quantity regulation this quantity is increased when the amount of fuel is decreased to obtain the fractional loads. Therefore, with that method there is enough air present at all but the maximum load and a slower burning mixture results. In the quantity regulation this is obviated by decreasing the air supply with the fuel so that the mixture is in practically the same proportion for all loads, but varies in quantity to meet the requirements.

The variation is generally effected by throttling the entering charge or mixture and Fig. 7 shows a diagram with straight throttling. Theoretically, the efficiency of engines governed by the quantity method should decrease as the load decreases, because of the decreasing

compression pressure, which would cause slower burning of the charge. Practically the efficiency falls for this reason and also because of the increasing negative work of the lower loop of the diagram, which grows larger as the throttling increases.

It has been shown that it is desirable to maintain proper proportions of fuel and air at all loads and that as the load increases against the engine a more powerful explosive charge is necessary. It would appear that the construction of a carburetor for heavy fuels would be simply a problem of fuel and air proportion, and some designers have been working along these lines, believing that a perfected gasoline carburetor plus an effective vaporizer would enable kerosene to be utilized on automobiles with the same degree of perfection as gasoline. It is held by engineers abroad where considerable experimentation has been conducted in heavy fuels, that this is not possible; that there are factors which do not coincide with gasoline carbureting practise; that more or less trouble is experienced, including visible exhaust, in varying the speed and load. These will be discussed in logical sequence.

A brief review of the methods utilized for obtaining an explosive mixture with gasoline as a fuel will be of value to the reader not familiar with the principles of carburetion, in showing some of the difficulties being experienced by designers of heavy fuel carburetors.

It has been explained that to obtain an explosive mixture of a liquid fuel it is first necessary to convert the fuel into a vapor. The lighter distillates, gasoline, etc., are easily vaporized, but the heavier, including kerosene, are more difficult. With the lighter oils the device for vaporizing the fuel is termed a carburetor, that for the heavier liquids a vaporizer, and throughout this discussion this distinction will be observed.

The vaporization of gasoline is effected by bringing the current of air that is on its way to

Fig. 9—Concentric Type of Spray Nozzle.

the cylinder, over, through, or in some other manner into intimate contact with the fuel. A given amount of air will take up an amount of gasoline which depends on the nature of the distillate, temperature of the air and fuel, and the humidity of the air. When the air has taken up its charge of gasoline, it is said to be carbureted. The lighter (and more volatile) the fuel, the more of it will be vaporized by a given volume of air. These factors were discussed in the previous installment and supplemented by tables.

Gasoline is a mixture of many components, and upon the passage of air over a surface of the fuel, the more volatile components vaporize first, leaving a residue which becomes denser and denser and which gives off vapor at a constantly decreasing rate. This selective evaporation is not desirable. The vaporization of gasoline, like that

and gasoline is brought into contact, these including the surface, bubbling and spray or jet. There is also a type termed the puddle carburetor. In the surface device air is made to pass over a gasoline surface or an extended one wetted with the fuel. The most common form is a wick or flannel carburetor. The air in coming into contact with the gasoline and wetted surfaces becomes saturated with vapors. The objections to this type are: Selective evaporation and cooling of the mass by the vaporization. A device in which the air in its passage to the cylinder is made to pass through the fuel is termed a bubbling carburetor.

With the spray type the amount of gasoline required during one intake stroke of the cylinder is sprayed into the entering air. It is partly vaporized and partly atomized, and enters the cylinder as a vapor and a liquid. Being separated from the main body of fuel there is no cooling action on the mass of gasoline, and no alteration in its composition by selective evaporation. If the fuel chamber be heated it is to increase the volatility.

The spraying occurs when air is being drawn into the cylinder by the suction of the piston (intake stroke). The spraying nozzle may differ as to shape as will be noted by reference to Fig. 8, which depicts conventional types. That at A has a fixed orifice, being a plain, cylindrical, hollow tube with a choked opening. With this design the quantity of fuel discharged may be said to be fixed. The amount of fuel sprayed into the incoming air may be regulated by the addition of adjustable needle as illustrated at B. The needle may be inverted as indicated at C. The supply of fuel is so regulated that its height is just below the tip of the spraying nozzle and the last named is located in the air pipe leading to the cylinder of the engine, as shown at A, Fig. 9, and C, Fig. 10. The diameter of the pipe is often restricted or reduced—a construction termed a Venturi tube—being utilized to increase the velocity around and above the nozzle; thus decreasing the pressure and making a greater head available for causing flow.

During the suction (intake) stroke of the cylinder the pressure within the air pipe is reduced below that of the atmosphere, and the air rushing past the nozzle creates an additional slight pressure drop immediately opposite the end of the latter. This double reduction of pressure opposite the end of the nozzle causes a small jet of gasoline to be discharged in the air current by atmospheric pressure on the liquid surface in the reservoir. With throttle governed engines the valve may be so placed as to control the quantity

Fig. 10—Showing Location of Spraying Jet C in Conventional Type of Carburetor.

of water or of any other liquid, requires the addition of heat; that is, the so-called latent heat of vaporization. With gasoline the amount necessary is small, and can be taken from the air being carbureted without reducing the temperature of the latter to an abnormal value. If, however, the air is initially at a very low temperature, as in cold weather, its temperature just beyond the nozzle of the carburetor may be reduced to a very low value and trouble may be experienced; the air may not be able to give up enough heat to vaporize all the fuel it has drawn out of the nozzle, or the temperature may get so low as to cause precipitation. These factors are overcome in practise by utilizing the heat of the water jacket and exhaust.

#### Types of Carburetors.

Carburetors utilized may be divided into three classes according to the method by which the air

and velocity of air flowing through the carburetor and indirectly the amount of fuel and air. Spraying types of carburetors are constructed with double jets and with fixed as well as auxiliary air, because the speed and load of the automobile engine changes and the same setting of the needle will not give the same quality of mixture due to the wide variation in the suction effect on the nozzle accompanying wide variation of the quantity, and hence the velocity, of air flowing past the nozzle. With multiple-jet carburetors the object sought is to have one or both operative as conditions require and the auxiliary air is employed to maintain the proper proportions of fuel and air at high engine speeds.

(To Be Continued.)

Ed. Note—The next installment will deal with the difficulties in using kerosene when the speed and load of the engine are varied, as in operation.

### HOW COLE WITHSTOOD TRIP.

#### Car Completely Dismantled After Cross Country Drive to Pacific Coast.

Shortly after completing a run from Indianapolis, Ind., to San Francisco, Chief Engineer Charles S. Crawford of the Cole Motor Car Company, Indianapolis, dismantled the test car in which he arrived on the Pacific Coast coincidentally with the tourists of the Indiana Automobile Manufacturers' Association. The result of his examination is given as follows:

Examination of the spark plugs showed them to be well covered with carbon, but still capable of doing their full work, in good firing condition and a readjustment of their points unnecessary. The starting switch was examined for arcing effects in the circuits and their condition was vouched for by a well known electrical expert, who stated that they did not look as though an electrical current had ever passed through them.

The cylinders, when removed, were found to still retain the original machine marks and showed no appreciable wear, the piston rings showing a true seat for their full width and length and with an entire absence of dark spots on them. The compression chamber of the cylinders and the piston heads were found covered with a carbon deposit which was of a sooty nature and perhaps a 32nd of an inch in thickness. This was easily removed with a rag and no scraping tools were found necessary. All intake valves had a bright polish on the seat, although the edges of the parts had a heavy carbon deposit. The exhaust valves showed no head color, which proves the fact that the valves are amply water jacketed. It is incontestably proven that tungsten steel, used in the valves, is immune from any warping or pitting.

Naturally the various bearings came in for the greatest scrutiny. All crankshaft and connecting rod bearings, despite the fact that these bearings had been given a clearance of .0001 inch above normal before leaving Indianapolis, were in splendid condition. Every effort was made during the trip out here to pound or burn out these bearings, but without result.

The brakes are still in good serviceable condition and ready for many more thousands of miles of usage. The pressed steel gasoline tank, which many times in the

muddy districts supported the complete weight of the rear end of the car, shows no ill effects from its extraordinary abuse.

The carburetor, while completely covered with sand and mud, was in good condition. Exterior cleaning was its only want. The dissection of the entire car revealed the fact that not one bolt, nut, cotter or any part had become loosened or that any part was not performing its function in a most creditable manner.

### KEROSENE BURNING CARS.

#### Report Concerning Henderson Cars in Recent Indiana-Pacific Tour.

As is more or less well known, R. P. Henderson, designer of the Henderson car, and Ray Harroun, inventor of the kerosene carburetor, adopted by the Henderson Motor Car Company, Indianapolis, Ind., as optional equipment on 1914 models, drove two of these kerosene burning machines on the recent Indiana-Pacific tour of the Indiana Automobile Manufacturers' Association. Each car carried five passengers, and the fuel cost a passenger figured out at \$6.50, according to Mr. Henderson.

He states that he found kerosene increased the motor's efficiency, this being due, as he expresses it, to the fact that the new fuel has a higher heat unit than gasoline. He says the explosive power is no greater, however. He holds that it took less kerosene vapor than gasoline in the cylinders, and that the new fuel prevented the formation of carbon deposits. He says:

In one spot we drove 25 miles on second gear, owing to poor road conditions. That meant the motor was revolving about three times as fast as on high gear, yet at this speed the kerosene was turned into vapor just as effectively as at slower speed. The problem of vaporizing kerosene is the thing that barred it as a fuel previous to our success.

In the higher altitudes, where the average motor car loses two per cent. of its power for every 1000 feet upward it travels, our cars showed no loss of power whatever. At 12,000 feet the average car loses 25 per cent. of its power. We have driven in high altitudes before and have measured power loss accurately, but we were surprised to find no such occurrence on this occasion.

Henry J. Adams, Cleveland, O., driving a new Reo the Fifth touring car, made by the Reo Motor Car Company, Lansing, Mich., recently completed a 684-mile trip around Lake Erie, by way of Buffalo, St. Catharines, Detroit and Toledo, in 20:31:00, actual running time. There were four in the party and they were delayed 2:33:00 in securing a Canadian license, in crossing railroads, by traffic holdups, punctures, etc. The motor was not stopped during the entire 23:04:00. It will be noted that the actual running time figures out at an average speed of approximately 33 miles an hour.

## IN THE REALM OF THE MOTORCYCLIST.

### United States Army Adopts the Two-Wheel Mount--Henderson Model for 1914--- New Machines from Omaha and Harrisburg---Sliding Sleeve Engine.

**A**FTER several tests in which every available means of communication between the different divisions of the army were used, the United States government announces that the second division of the reorganized army now stationed at Galveston and Texas City, Tex., has decided upon the motorcycle as the most efficient and has ordered a number of machines for use in this service.

One of the tests made in this connection was the delivering of an order from the division headquarters to the various brigade commanders. The distance was about five miles. Wireless instruments were provided and the message was sent in this way. Another message was sent by tele-

go. Some little confusion has resulted because of the fact that the chairman of this committee has been a New York City man for so many years, but it is anticipated that riders and others having business with the committee will soon become accustomed to the change.

#### New Henderson Model.

While the Henderson Motorcycle Company, Detroit, has not made public the details of the two-speed feature with which the Henderson four-cylinder models for 1914 are to be equipped, the other changes do not indicate a radical departure from former practise with this company. The motor remains the same in general design, but each piston has been lightened by three ounces, which is expected to result in increased speed and flexibility. The cam gears are to be made of steel, and the crankshaft and connecting rod bearings will be of bronze, with babbitt metal linings. The saddle position has been lowered an inch and special provision has been made to enable the rider to adjust the saddle spring tension to suit his weight. The friction surface of the clutch has been nearly doubled and the band brake has undergone such modifications that it is expected to act more effectively. The spring fork has been made heavier, and accompanying this is the use of a drop forged steel frame head that has been specially reinforced to give added strength and riding comfort.

#### Flescher Flyer from Omaha.

Louis Flescher, a pioneer motorcycle man in the West, is organizing a company in Omaha, Neb., for the production of the Flescher Flyer, a nine horsepower twin. The motor will be a De Luxe. The frame will be constructed of 1.25-inch tubing and the compound spring fork will be of special design, in which a light spring is utilized to take up the shocks before the larger spring comes into action. One of the chief features is the use of a drip feed lubricating device by which through a lever connecting with the saddle the oil is turned on when the rider seats himself on

**Henderson Four-Cylinder Model for 1914 Will Be Fitted with Two-Speed Device.**

phone over ground wires which had been laid previously. A third was delivered by an orderly mounted on horseback, and a fourth was relayed by "wigwagging." None of these messages reached its destination so quickly as the one carried by an orderly mounted on a twin motorcycle.

#### Competition Committee Headquarters.

John L. Donovan, Chicago, who was appointed chairman of the competition committee of the Federation of American Motorcyclists by President Patterson, immediately after the latter's reelection at the Denver convention, announces that the new headquarters of his committee will be located in room 819, Ashland building. Chica-

Gustav V. Harn, Secretary-Treasurer, Milwaukee Cycle Supply & Sales Company, Merkel Representative in Milwaukee, Wis.

the saddle, and is cut off immediately the rider leaves the seat. The drive will be by Spartan V belt, through an Eclipse clutch, which is operated by the left hand grip. The throttle is controlled by the right grip, and the spark advance by a lever attached to the tank on the left side of the machine. A special patented muffler is fitted, which is claimed to give a very quiet exhaust without back pressure.

#### Slide Valve Motorcycle Engine.

The Goby Engine Company, Cleveland, O., is working on a sliding valve motorcycle engine, which has a single sleeve located outside the combustion chamber. Christian Goby, president of the Perfection Spring Company, is said to be responsible for the design, which bears his name. The manager of the company is Thomas J. Fay, well known as a mechanical expert.

#### Merkel Is Columbus Champion.

Ray Snyder took the Columbus championship race at Columbus, O., Aug. 25, while riding a Flying Merkel machine. Carl Goudy on an Excelsior finished a winner in the 100-mile event, with Taylor on a Flying Merkel second. The summary:

Five miles, amateur—First, Wooley, Indian; second, Hills, Merkel; third, Woodland, Indian; time, 5:05.2.

Ten miles, professionals—First, Perry, Excelsior; second, Goudy, Excelsior; third, Birkenbach, Thor; time, 8:37.8.

Five miles, sidecars—First, Shepard, Indian; second, Doloff, Indian; time, 6:33.

Five miles, Columbus championship—First, Snyder, Merkel; second, Birkenbach, Thor; third, Hare, Indian; time, 4:36.8.

One hundred miles—First, Goudy, Excelsior; second, Taylor, Merkel; third, Hare, Indian; time, 92:00.

#### Results at Marion, Ind.

Six events were run off on a poor surface at the half mile dirt track, Marion, Ind., Aug. 24. The results follow:

Five miles, novice—First, Smith, Merkel; second, Shimer, Indian; third, Warner, Excelsior; time, 7:24.4.

Five miles, professional—First, Lee, Indian; second, Thompson, Indian; third, Tennant, Merkel; time, 6:51.

Ten miles, county race—First, Keckman, Indian; no others finished; time, 14:25.6.

Five miles, professional—First, Culp, Excelsior; second, Thompson, Indian; third, Neukon, Indian; time, 6:39.

Fifteen miles, professional—First, Goudy, Excelsior; second, Thompson, Indian; third, Culp, Excelsior; time, 20:05.4.

Twenty-five miles, professional—First, Culp, Excelsior; second, Neukon, Indian; third, Goudy, Excelsior; time, 34:56.2.

#### Merkel's Branch Factory Opened.

All the machinery at the plant of the Miami Cycle & Manufacturing Company's plant in Middletown, O., which will be utilized in the manufacture of Flying Merkel engines at its commodious branch plant in Indianapolis, Ind., has been installed in its new home. Power was turned on the new factory Sept. 2 and President K. R. Jacoby expects that deliveries of 1914 machines will be begun during the month of September.

## ALWAYS READY FOR ANY EMERGENCY!

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1913 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

"Made Its Name on Merkel Mileage."

Middletown, Ohio, U. S. A.

### Los Angeles Joy Ride.

The fifth annual run of the Los Angeles Motorcycle Club to Venice was a veritable joy ride from start to finish. About 1700 riders from all sections of southern California took part in the event, the various makes of machines being represented somewhat as follows: Thor, 139; Excelsior, 109; Harley-Davidson, 87; Merkel, 39; Pope, 19; R-S, 16; Minneapolis, eight; Henderson, seven; De Luxe, six; M-M, six; Pierce, five; Monarch, five; New Era, three; Thiem, three; Wagner, two; Eagle, two.

### Hendee Buys Estate.

George M. Hendee, president of the Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, has purchased an estate of about 200 acres at Suffield, Conn., which he will convert into a country retreat. The pur-

W. G. Schack, General Manager, Emblem Manufacturing Company, Displaying a Portion of the Emblem Line.

chase was made from six persons at an outlay of \$40,000. The tract is heavily wooded, but Mr. Hendee is to breed pedigreed birds and game. His residence will overlook the Connecticut river, Wilbraham hills and Mount Tom on the north and the Connecticut plain far to the south. It will be one of the finest estates in that part of the country.

### Woman's 65,000-Mile Journey.

One of the longest motorcycle trips ever undertaken by a woman is that of Mrs. Harry Humphreys, champion long distance rider of England. The route scheduled for the trip covers 65,000 miles and contemplates a visit to every capital of the world. Mrs. Humphreys has completed the first leg of the journey, having crossed from San Francisco to New York, from which point she sailed for London. An average of 200

miles a day was maintained on the cross country journey. The tour is in the nature of an endurance test of machine and rider, and if Mrs. Humphreys succeeds in completing the trip within two years and arrives back at San Francisco in time for the opening of the Pan-American exposition in 1915, she will be awarded the sum of \$10,000.

### No F. A. M. Meeting at Brooklyn.

A majority of the board of directors of the Federation of American Motorcyclists has voted against the proposed Brooklyn meeting of the national assembly, denying its legality. Since the meeting was first proposed, Secretary G. B. Gibson has contended that a notice of 30 days was required, as with all national assembly meetings. Legal advice was secured and in conformity with this the foregoing action was taken.

### Balke Made New Track Record.

The recent two-day meet at Rockland, Ill., held by the Rockland Motorcycle Club, was a decided success and resulted in some fine racing. Balke, the Indian rider, reduced the track mile record from 52.5 to 52.4 and was the only rider to cover the course in that time.

### To Produce Gerhart Machine.

The Gerhart Motorcycle Company has been incorporated in Harrisburg, Penn., and it is stated that the concern will erect a factory at Paxtang, near that city, for the production of Gerhart machines. It is understood that modern machinery will be installed and that the plant will be operated by electric power. Charles Gerhart is president of the company, which has located temporary offices in the Bergner building, Harrisburg.

### Make Severe Hill Test.

That the motorcycle does not fear to go up grades generally avoided by automobiles was demonstrated in Marshalltown, Ia., recently, when two machines went to the top of one of the steepest hills in that vicinity. One mount carried six persons and the other five.

### Long Distance Motorcycle Vacations.

Harvery Bernard and John Purdy of Chicago recently completed a 1200-mile vacation trip between Denver and Chicago, utilizing a single-speed, eight horsepower machine with sidecar attachment. Clarence Martin of Milwaukee, Wis., has arrived in Boston, Mass., on a similar vacation trip.

### F. A. M. Pays Another Reward.

Secretary-Treasurer G. B. Gibson of the Federation of American Motorcyclists, has paid another reward of \$25 for the apprehension of a motorcycle thief. Edward Nelson of Aberdeen, S.

D., had his machine stolen June 15. It was recovered by Edwin Voss of Peoria, Ill., and the thief was arrested, tried, convicted and sentenced. The regular affidavit having been received by Dr. Gibson the check was mailed to Voss last week.

#### On a Motorcycle Honeymoon.

An accompanying illustration presents Mr. and Mrs. Harry W. Long of Napoleon, O., who are enjoying a honeymoon trip throughout the East on a Flying Merkel machine. Mr. Long formerly was a racing rider, but is now a leading motorcycle and bicycle dealer. He has a sidecar, but Mrs. Long much prefers to ride tandem. On their way East they spent two or three days as guests of C. R. Miller, superintendent of the Merkel plant in Middletown, O.

#### Hollister Wins Long Race.

Tracy Hollister recently won the 112-mile road race from La Grande to Baker City, Ore., riding a six horsepower Merkel machine, made by the Miami Cycle & Manufacturing Company, Middletown, O. The course was uphill the entire distance with considerable sand. Hollister's time was 3:42.

#### Races at La Porte, Ind.

Twenty-five hundred people witnessed the Labor Day races at La Porte, Ind. Joseph C. Smith acted as referee, Lewis Paul as starter, C. Holloway as announcer, Jay Kanney, Carl Kanney and L. E. Henning as timers, and Oscar Wiegart, Charles Gropp and Edward Schultz as judges. The results follow:

Three miles, amateur—First, Alfred Sage, Indian; second, Carl Long, Indian; third, Fred Knoll, Excelsior; time, 4:30.

Five miles, open—First, Harry Rowe, Thor; second, Eugene Culp, Indian; third, William Goudy, Indian; time, 6:33.

Eight miles, open—First, Goudy, Indian; second, Brier, Thor; third, Culp, Indian; time, not given.

Five miles, amateur—First, Goudy, Indian; second, Rowe, Thor; time, not given.

#### Motorcycle Saves Life.

While riding beside the railroad tracks near Visalia, Cal., S. J. Allpoz saw a man sleeping between the rails, when the headlight of an approaching freight train came into view. Putting on full power, Allpoz forged ahead and jumped from his machine just in time to pull the man to safety.

#### Club Notes, Here and There.

Indian riders in Troy, O., have formed the Indiana Motorcycle Club with a charter membership of 22.

The Galesburg Motorcycle Club, Galesburg, Ill., has elected the following officers: President, Fred Hutton; vice president and secretary, Lee Wright; treasurer, Fred Wiedenhammer.

The North Shore Motorcycle Club, Chicago, is laying plans for an endurance run the latter part of September and a hill climb early in October.

The St. Louis Motorcycle Club and the South Side Motorcycle Club, both of St. Louis, Mo., have consolidated under the former name.

The Crookston Motorcycle Club has been organized in

Crookston, Minn., with the following officers: President, Howard Palen; vice president, Arno Lawrence; secretary, Algot Eck; treasurer, Dewey Kiewel.

Sheldon Sturges, Dwight Williams and Harold Bergh of New Haven, Conn., each mounted on an Indian, recently took a 530-mile outing to Atlantic City and return.

The Wichita Motorcycle Club, Wichita, Kan., recently held a sociable run, in connection with which prizes were awarded as follows: Get-away race, H. Stephens, Indian; sand-pulling contest, Ray Ellis, Pope; race around a city block, E. Swigart, R-S; 10-mile road race, H. Stephens, Indian.

The Evansville Motorcycle Club, Evansville, Ind., has petitioned the common council to repeal the ordinance recently passed forbidding tandem riding in that city.

The following clubs have affiliated with the Federation of American Motorcyclists recently: Twin City, Norfolk, Va., F. T. Ayers, secretary; Beloit, Beloit, Wis., R.

Mr. and Mrs. Harry W. Long, Napoleon, O., Who Are Enjoying Their Honeymoon on a Flying Merkel.

G. Talbot, 107 West Grand avenue; McPherson, McPherson, Kan., Leslie Enoch, 2125 North Main street.

The Lincoln Motorcycle Club, Lincoln, Neb., which was reorganized in April, has outgrown its present quarters and has secured additional room at 215 Fraternity building. The club now numbers some 80 members.

The Indianapolis Motorcycle Club, Indianapolis, Ind., has elected the following officers: President, J. McLain; vice president, J. Merz; secretary, J. Carr; treasurer, D. Baumann; captain, R. Hoffstatter.

Members of the Muncie Motorcycle Club, Muncie, Ind., have been enjoying a game of motorcycle hare and hounds during the past summer. The game is said to have originated with the St. Louis club last spring.

#### JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

#### E. M. ESTABROOK

Chairman Membership Committee Federation  
American Motorcyclists,  
BANGOR, MAINE.

Please send me the F. A. M. Booklet and all information interesting to prospective members.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor vehicles, accessories, etc.:

**Etna Motor Truck Company**, Detroit; \$400,000; to produce 1.5-ton worm driven wagons; J. George Wagner and others.

**Oshkosh Pneumatic Hub Company**, Oshkosh, Wis.; \$20,000; to produce pneumatic hubs for motor vehicle wheels; Fred E. Zeuhlke, Frank Doemel, Joseph Laus, Jr.

**Boston Prest-O-Seal Company**, Boston, Mass.; \$26,000; W. G. Tood, M. T. Hubbard.

**Parish-Ferrell Manufacturing Company**, Harrisburg, Penn.; \$50,000.

**Bridgeport Body Company**, Bridgeport, Conn.; \$50,000; to manufacture motor car bodies; A. W. Terry, A. W. Seward, J. W. Horton.

**Manufacturers' Sales Agency**, Bridgeport, Conn.; \$25,000; M. V. Doud, F. K. Doud, William L. Scott.

**Falcon Company**, Cleveland, O.; \$15,000; J. H. Cassidy, D. C. Meek, M. A. Copland, C. Verbsky, W. S. Mitchell.

**Isham Garage Company**, Coffeyville, Kan.; \$5,000; E. H. H. George, N. O. Upham, S. H. Hess, C. D. Welch, G. Buylless.

**McGraw Tire & Rubber Company**, East Palestine, O.; \$1,000,000.

**McClintock Engine Company**, Detroit; \$200,000; Dela-

**Bavler Lubricating System**, New York City; \$10,000; to manufacture lubricating systems; E. Well, G. H. Duck, C. S. Bavler.

**Auto Pedal Pad Company**, New York City; \$10,000; to manufacture pedal pads; H. Reich, E. M. Lichter, G. T. Young.

## WITH THE MANUFACTURERS.

**Owen McCusker** has been appointed manager of the Locomobile factory branch in Seattle, Wash.

**F. J. Urban**, sales manager of the Remy Electric Company, Anderson, Ind., has removed his headquarters to Chicago.

**A. R. Dawson** has been appointed factory sales agent for the Lozier Motor Company, Detroit, his territory including Nevada, Arizona, California and western Oregon.

**I. F. Scheeler**, South American representative of the Hudson Motor Car Company, Detroit, has been spending some time in this country, making his headquarters at the Hudson branch in New York City.

**J. M. Studebaker**, who is over 80 years of age and who is regarded as the dean of automobile manufacturers because of this fact, is an ardent motorist and drives his own car between his residence, Sunnyside, and his office in the works of the Studebaker Corporation at South Bend, Ind. The accompanying illustration shows him at the wheel of a Studebaker Six, which he regards as by far the best piece of work yet done by the designer, James Heaslet.

**Henry C. Miller**, Pacific Coast manager for the B. F. Goodrich Company, Akron, O., was married recently to Miss Gertrude Youngblood of Detroit.

**F. B. Ludwig** has resigned as sales and advertising manager of the Edwards Motor Car Company, New York City, to become southern district manager for the Vellie Motor Vehicle Company, with branch headquarters at 453 Peachtree avenue, Atlanta, Ga.

**W. H. Ellenbeck**, formerly special representative of the United States Tire Company in Philadelphia, has been appointed manager of the branch in Worcester, Mass., succeeding L. E. Hevaner, resigned.

**The Jones Speedometer Company** has removed its executive offices from New York to New Rochelle, the location of the main factory. The Bush Terminal plant in Brooklyn will be maintained and operated as heretofore.

**The Bremen-Wilson Manufacturing Company**, recently incorporated in Benton Harbor, Mich., with a capital of \$150,000, for the manufacture of starters and other accessories, has plans for two buildings, 60 by 100 and 25 by 60 feet.

**The Goodrich Rubber Company**, Toronto, Ont., has purchased a large tract of land from the Ontario Power Company and will erect a factory or group of factory buildings in which some 1800 men will be employed in the production of Goodrich tires for the Canadian trade.

**The Uhrlandt Gas Generator Company**, recently incorporated in Columbus, O., with capital of \$50,000, for the production of gas generators, has established offices at 82 West Broad street, and has opened a factory at Linn and Ludlow streets.

**The Empire Automobile Company**, Indianapolis, Ind., has removed its executive offices from 238 Massachusetts avenue to 528 North Capitol avenue.

**The Welding Company**, Springfield, Mass., with branches in Boston, Holyoke, Hartford and Bridgeport, has opened another branch at 281 Bridge street, Salem, Mass.

**The La Bell Funeral Motor Car Company** has been organized in Detroit to place in the market the La Bell funeral car, having compartment for casket, flowers, mourners and pall bearers. The body is subject to a patent recently issued to A. La Bell.

**The General Motors Company**, Detroit, has again an-

**J. M. Studebaker, Octogenarian Automobile Manufacturer, Enjoying a Drive in His Studebaker Six.**

ware corporation; to manufacture combustion engines; Francis C. Osborn, G. Edgar Allen, Charles D. McClintock.

**Capital City Taxicab Company**, Edmonton, Alta.; \$100,000.

**Falconer Iron Works**, Falconer, N. Y.; \$15,000; repair shop and garage; G. L. Gilbert, J. C. Wright, J. S. Wright.

**Chandler Motor Car Company**, Fort Worth, Tex.; \$5,000; B. K. Smith, M. H. Smith, R. E. Southern.

**Rapid Heater Company**, Grand Rapids, Mich.; \$8,000; to deal in motor cars; A. Harris, J. S. McDowell.

**Town Herman Auto Transit Company**, Herman, Wis.; \$8,000; W. Grosshuesch, A. Frome, Jr., W. F. Buscher.

**Monarch Auto Company**, Louisville, Ky.; \$10,000; to sell automobiles; C. H. Pierson, J. Gosnell, G. W. Aydelott, A. T. Wingate, C. A. Colley, J. L. Morris.

**Kentucky Kissel Car Sales Company**, Lexington, Ky.; S. H. Halley, O. R. Hukle, P. M. Justice.

**Auto Distributors Company**, Logansport, Ind.; \$10,000; F. C. King, O. H. Binns, A. E. Binns.

**Canadian Drednot Motor Trucks, Ltd.**, Montreal, Que.; \$125,000; W. L. Haskell, J. S. Bigby.

**Crown Motor Car & Foundries, Ltd.**, Montreal, Que.; \$100,000.

**Velvet Company**, New York City; \$5,000; to manufacture motors; W. D. Ramsburgh, H. C. Proctor, A. H. Miller.

**New Era Tire Treatment Company**, Regina, Sask.; \$20,000.

# Tarvia

*Preserves Roads  
Prevents Dust~*

Sage Foundation Homes Co., Forest Hills, L. I. Constructed with "Tarvia X" 1910. Treated with "Tarvia B" 1913.

## Dust is Expensive

WHEN an automobile speeds down an ordinary macadam road it leaves in its wake a cloud of dust which is carried by the winds over the neighboring fields, houses and lawns.

This is just as surely a waste of good material as if the automobilist dug material out of the highway and carted it away. Dust represents waste—costly waste—and the taxpayers feel the result. A road that is properly built for modern traffic will not be dusty.

Plain macadam gives way under the wear and tear of heavy rubber-tired automobile wheels and the surface binder of the road is

torn away in the form of dust, until in time the coarse stone itself is exposed and a costly renewal of the road is necessary.

Modern roads should be built to resist modern traffic. To build any other kind is wasteful. A better binder than the ordinary mineral binder is needed and is offered in Tarvia, a coal tar compound especially prepared for use on roads.

Tarvia is dense, viscid, waterproof. It fills the interstices between the stone and forms a tough, plastic matrix. This makes a waterproof and automobile-proof surface. The maintenance cost is usually so low as to more than balance the cost of Tarvia treatment.

*Booklet, on request*

anticipated payment on its notes, making a payment of \$1,000,000 to the Central Trust Company of that city in August on notes due Oct. 1.

**The Motor & Manufacturing Company**, Lux Light building, Buffalo, N. Y., has purchased property in that city and will erect a new factory.

**The Peters Machine & Manufacturing Company**, Whitney Power building, Cleveland, O., maker of automobile parts, will erect a new factory on West Madison avenue and purchase \$35,000 worth of new machinery.

**The Bosch Magneto Company**, New York City, is building a casino and restaurant opposite its factory on North Main street, Springfield, Mass., at a cost of \$18,000.

**The Motor Casting Company**, Pontiac, Mich., is enlarging its present plant.

**The Packard Motor Car Company**, Detroit, has declared its regular quarterly dividend of 1.75 per cent. on preferred stock, payable Sept. 15.

**The Standard Automobile Company**, Moose Jaw, Sask., is a new concern in the Canadian industry, and will produce cars fitted with wire wheels.

**The Milwaukee Auto Specialty Company**, Milwaukee, Wis., maker of accessories, has opened a garage and service station at Chestnut and Seventh streets, adjoining its factory. Walter R. Fleischer is in charge as manager.

**The Electric Auto-Light Company**, Toledo, O., maker of starting, lighting and ignition systems, has by the erection of the building shown by the accompanying illustration, increased the floor space of its plant more than 25,000 square feet. More than 100 additional workmen

**The New Factory of the Electric Auto-Light Company at Toledo, O., Which Has Greatly Increased the Production of That Concern.**

have been employed. The building has been equipped with high-grade automatic machinery. The company now has a capacity of 100 complete systems a day, but it is believed that it will be necessary to still further increase the production departments before the end of the year.

**The El Starr Manufacturing Company**, Milwaukee, Wis., has leased the Wilson building, 223-229 Erie street, Chicago, and is planning to remove its factory to that city.

#### GARAGE AND DEALER.

**Edgar Walker** has opened a showroom for Gaulois tires at 127 Bay street, Toronto, Ont.

**John Hall, Jr.**, has purchased the interest of his partner, William Mitchell, in the body painting business conducted by them in Springfield, Mass.

**G. & E. Tisch**, Grand Rapids, Mich., has been appointed distributor for Federal tires in western Michigan.

**The Velle-Paige Motor Car Company**, Cleveland, O., has changed its name to the Velle Motor Car Company, and will handle the Velle line only in the future.

**The Bunting-Stone Hardware Company**, Kansas City, Mo., will open a motor car accessory department in connection with its hardware business in the near future.

**Milton A. Kent** has sold his interests in the Rambler Sales Room, 366 Park avenue, Kenosha, Wis., to Charles

E. Turnock, who will handle the Rambler line in Kenosha county and the eastern half of Racine county.

**The F. B. Stearns Company**, Cleveland, O., has opened a new factory branch at 742 South Olive street, Los Angeles, Cal. J. H. Duffee is in charge as manager.

**The Twyman Motor Car Company**, Studebaker distributor, has opened a new retail establishment in Columbus, O. The company has a wholesale store in that city and maintains retail branches in Dayton and Cincinnati, supplying nearly 100 dealers. O. W. Lawson is manager of the new store.

**The Garland Automobile Company**, Pepperell square, Saco, Me., has been reorganized, the new firm comprising William A. Gilman and Ira Garland.

**The Day & Night Garage** has been established at 316-318 Avenue C, Miami, Fla., under the management of E. W. Palmquist and A. M. Campbell.

**The S. W. Crawford Auto Company**, De Soto, Mo., agent for Ford cars, has opened a garage and repair shop on Easton street.

**J. D. Perry Lewis**, St. Louis, Mo., has taken over the city and state agency for Marion cars and secured salesrooms at Walton and Washington avenues.

**The Abbott Motor Car Company**, Detroit, factory branch of the Abbott Motor Company of that city, has placed its business in the hands of the Gaston-Richardson Company, a new firm, composed of George T. Gaston and Douglas C. Richardson. The present quarters at Jefferson avenue and Brush street will be retained.

**Ray Alberts** has purchased a half-interest in the garage owned by H. J. Hornung, on Fifth street, Eureka, Cal.

**The Fred M. Smith Company**, Hibbing, Mich., has changed its name to the Advance Auto Company. G. N. Buchart is president.

**The D. C. Tiffany Company**, Boston, which has operated an exclusively electric garage, has become an agency, taking on the Ohio electric line.

**Curtis Dawson** has purchased his partner's interest in the Tiskilwa Auto Company, Tiskilwa, Ill., and will continue the business alone.

**The National Garage Company**, 508 14th street, Washington, D. C., has taken over the business heretofore conducted by Collins, Gru & Meagher.

**The Acme Top & Trimming Company**, 1333 14th street, Washington, D. C., has been formed by R. L. Hooven and Frank Hann, to deal in and repair automobile tops and trimmings.

**The Hudson Automobile Company**, a new Hudson agent in Washington, D. C., has located at 1136 Connecticut avenue. Howard G. Kneessi is manager.

**Henry L. Hornberger**, formerly manager of the Oakland branch in San Francisco, has formed the Henry L. Hornberger Company, to handle the distribution of Palmer-Singer cars in California, Oregon, Washington and Idaho.

**The Doxameter Sales Company** has been organized by L. E. Carpenter and A. W. Clark at 510 Temple court, Minneapolis, Minn., to handle the Doxameter.

**The Wetmore-Quinn Company**, Detroit, which recently purchased the Paige agency from the William J. Marshall Auto Company, has added the Lozier to its line. Mr. Wetmore formerly was assistant sales manager of the Lozier Motor Company.

**Clarence Campbell**, Strawberry Point, Ia., has opened a garage and is negotiating for the agency for a medium priced car.

**Otto Haug & Son**, which recently removed from Great Bend, Kan., to Manchester, Ia., is enlarging its repair shop and garage.

**The Hearsey-Willis Company**, Indianapolis, Ind., distributor for Hupmobile cars, has removed to 339 North Capitol avenue.

**The Hunter Automobile Company**, Watertown, S. D., will remove from the Harper building to a new location where it will handle the Ford and Cadillac lines.

**The Balline Auto Company**, Watertown, S. D., will occupy the garage in the Walker building vacated by the Hunter Automobile Company, where it will handle Chalmers and Overland cars. The company also maintains a garage in Redfield, S. D.

## TO DEALERS AND GARAGE MEN

## RECENTLY ANNOUNCED 1914 MODELS.

**A**SIDE from the 1914 models described in more detail elsewhere in this issue, several others have made their appearance during the past two weeks. It will be noted that the list of cyclecars is being increased very rapidly. Only the more important features and changes are considered in the following brief statements concerning the new models:

**Moon**—Moon Motor Car Company, St. Louis, Mo. Model 42. Changes include: Motor driven tire pump. Force feed fuel system with tank at the rear of the car. Compartment in the cowl dash for smaller tools.

**Moline**—Moline Automobile Company, East Moline, Ill. Series M-40. Continues line previously announced with the exception of a new Weston-Mott full floating rear axle. New type of touring body.

**Los Angeles Cyclecar**—Los Angeles Cycle Car Company, Los Angeles, Cal. Motor, four-cylinder, T head, 2.5-inch bore, 3.5-inch stroke, rated at 12-15 horsepower. Friction transmission. Double chain drive. No differential. Wheelbase, 102 inches; tread, 44; weight, 500 pounds. Tires, 28 by 2.75 inches. Wire wheels. Two passengers, side by side. Speed about 60 miles an hour.

**Chalmers**—Chalmers Motor Company, Detroit. Model 24. Motor, six-cylinder, T head, en bloc, all mechanism enclosed, four-inch bore, 5.5-inch stroke. Clutch, multiple disc. Transmission, four speeds forward and reverse. Left hand drive, centre control. Six body types, streamline design, tapered bonnet, side lamps eliminated, clean running boards.

**Pathfinder**—Motor Manufacturing Company, Indianapolis, Ind. Five-passenger touring, two-passenger roadster, two-passenger cruiser and Martha Washington coach. Practically the same as previous models. Motor is the same except for lighter pistons and connecting rods, said to result in about 20 per cent. increase in power capacity. Some minor improvements in body design and equipment.

**Stearns**—F. B. Stearns Company, Cleveland, O. Coupe and sedan added to former line, fitted to either four or six-cylinder chassis. Knight motor continued. Six remains practically the same, while transmission in the four is moved from rear axle to amidships location. All models fitted with sloping hood, following so-called foreign practise; left hand drive, centre control and wire wheels, the last named being optional.

**Reo**—Reo Motor Car Company, Lansing, Mich. Reo the Fifth, fall series. Touring car and roadster, now equipped with electric starter, lights and horn, speedometer, mohair top, curtains, envelope, extra demountable rim, etc. Body is of new design. Instrument board and all instruments set flush. Electric searchlights have dimming arrangement. New design ventilating windshield. New style tire carrier holds rear light and number plate. Transmission has been changed with a view to silence and maximum efficiency. Wheels are 34 inches diameter with demountable rims; tires, 24 by four inches front and rear. Both brakes operated by pedal. Price reduced \$220.

**American**—American Motors Company, Indianapolis, Ind. Type 646, six-cylinder, six-passenger touring car. In many respects the chassis is identical with type 644, the principal changes being the lengthening of the wheelbase to 140 inches, a motor of 4.25-inch bore and 5.5-inch

stroke, and a new and improved electric equipment, the last named comprising two distinct units, both mounted in one housing. Cylinders are cast en bloc, but with separate exhaust ports for each, the manifold being bolted and easily removed. Body is a streamline design, with high flush sides and deep seats.

**Wahl**—Wahl Motor Company, Detroit. Two-passenger roadster and five-passenger touring car; one chassis. Motor, clutch and transmission in a unit. Four-cylinder, cast in pairs, 3.25-inch bore, 5.5-inch stroke. Constant level splash lubrication, pump circulation. Thermosiphon cooling. Bosch magneto. Holley carburetor. Multiple disc clutch, Raybestos lined. Three forward speeds and reverse. Salisbury semi-floating rear axle. Semi-elliptic springs front, full elliptic rear. Tires, 32 by 3.5 inches. Right hand drive, centre control. Equipment includes Prest-O-Lite tank, gas headlights, oil side and tail lamps, speedometer, windshield, mohair top, top envelope, etc.

**Imp Cyclecar**—Imp Cycle Car Company, Auburn, Ind. Motor, two-cylinder, vertical, 10 horsepower at 1500 revolutions, 15 at 2500, mechanically operated inlet valves, air-cooled, piston pump circulation for oil, high-tension magneto. Friction transmission. Drive by 1.125-inch V belt. No differential. Two transverse springs are mount-

Imp Cyclecar, an Entirely New Design from Auburn, Ind.

ed on underslung body at each end. Braking accomplished by a hard wood V block, attached on lever on radius rods and controlled by pedal, pressed into rear pulley grooves. Hand wheel for steering. Wire wheels, with 28 by 2.5-inch standard clincher tires. Wheelbase 100 inches, tread 36. Weight 450 pounds. Speed 50 miles an hour, maximum.

**Case**—J. I. Case Threshing Machine Company, Racine, Wis. Models 25, 35 and 40, all four-cylinder. Model 40 continued from last season, with improvements, including: Bosch two-point ignition, new type of Rayfield carburetor, heavier rear axle shafts and new cowl board. Model 25 has unit power plant, T head engine, 3.75-inch bore, 4.75-inch stroke. Plunger pump lubrication with auxiliary splash. Cooling by centrifugal pump. Bosch duplex ignition. Non-water jacketed Rayfield carburetor. Disc clutch. Three forward speeds and reverse. Weston-Mott three-quarter floating rear axle. Rear springs, platform type, with cross piece linked freely to semi-elliptic side members. Tires, 32 by four inches on quick detachable rims. Left hand drive, centre control. Model 35 differs principally as follows: Motor, 4.125-inch bore, 5.5-inch stroke. Gear pump lubrication. Bosch dual ignition. Water jacketed carburetor. Full floating rear axle. Three-quarter elliptic rear springs. Tires, 35 by 4.5 inches. All models equipped with Westinghouse electric lighting and starting system. Warner speedometer, eight-day clock, electric horn, extra tire on rim, two extra inner tubes, tire cover, Weed chains, top, windshield, spark plug pump and full set of lights.

## THE MOTOR TRUCK

## Let Your Motor Do The Work

The Pump that took the "Shun" out of Inflation.

It's a pleasure to inflate your tires without sweating, fuming and straining.

It's an economy to get the exact pressure you need to make your tires give maximum service.

It's a convenience to attach and detach your pump without a wrench. A twist of the wrist and a few seconds of time to attach the pump, one to four minutes with your motor at low speed to get the right pressure. The gauge tells you when to stop.

**THE BROWN IMPULSE TIRE PUMP** for 1913 is the only tire pump that attaches and detaches without a wrench; the only one that includes hose, self-opening valve connection, high grade recording gauge and Quick Detachable Spark Plug as part of its regular equipment. Your 1913 equipment is not complete without it. It sells for \$15.00. Ask your dealer today. If he can't tell you all about it, send to us for descriptive literature.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

## TRY THE M&M ECONOMIZER FOR SPEED, POWER AND ECONOMY

### HOW ABOUT THIS LETTER!

Moller Bros., Controller & Economizer Co., Lewistown, Pa.: Auburn, N. Y., August 14th, 1918.  
Gentlemen:—I am much pleased with the M&M Economizer that I put on my H&O touring car a few weeks ago. I am using a carburetor, which gives a very high mileage per gallon, but with the use of your Economizer I get several more miles per gallon, thereby making a marked saving in gasoline.

It also entirely eliminates the use of brakes, except on very steep grades, which saves much wear on brakes, and I believe is a saving on tires also. It takes a few days' practice to become familiar with the use of the Economizer, but any one will be well paid for their trouble in learning to use it. I would not part with mine for several times the price and cost of installing.

Yours very truly,

(Signed) F. LEE RODGERS.

WHAT COULD BE MORE CONVINCING THAN THE ABOVE LETTER! ALSO, the M&M is guaranteed to do just what we claim, and if it proves unsatisfactory within thirty days, YOUR MONEY WILL BE REFUNDED. (Reference—Citizens National Bank, Lewistown, Pa.)

The M&M is guaranteed to save from 40 to 50% of gasoline, and increase the speed and power 20% with less gasoline, and less carbon. It is the only known carburetor adjuster on the market, and RANKS FIRST AS A CARBON ELIMINATOR. For priming the motor, you cannot find its equal. PLEASE BEAR IN MIND—THERE IS NO SCREEN, or any other obstacle placed in the manifold, as this will have a tendency to CLOG THE MANIFOLD, and make it more difficult for the motor to absorb the gas and air.

Price of the M&M—\$3.50 and 17c extra for postage. We include either friction foot pedal, or steering post control, which consists of flexible shaft and wire. Requires 3/4" pipe tap. Elbow will be furnished upon request.

PRICE OF THE MOTORCYCLE SIZE—\$1.25 Prepaid. Size 1/4".

THE M&M ECONOMIZER IS "THE PATENTED ONE." Warning to users, makers and dealers, PATENT NO. 922,528—May 25, 1908.

WRITE US FOR FURTHER INFORMATION AND CATALOG.

## STANDARD OIL COMPANY

OF NEW YORK

## (BUYERS' GUIDE—Continued.)

# EMCO

## AUTOMOBILE OIL

Is Strictly a Mineral Product

**T**HE efficiency of any lubricant for use in automobile cylinders depends entirely on the ingredients of which it is composed. If there is any animal, vegetable or acid matter which is subject to decomposition you can never expect anything but lubrication trouble. If, on the other hand, you use a lubricant refined strictly from pure Pennsylvania crude, mineral oil, your lubrication problem is solved for all time.

Emco is just such an oil. Refined here in the very heart of the Pennsylvania Crude Oil Fields, it is positively without an equal anywhere, as thousands of Emco users will testify. As proof of our confidence in Emco Oil, we offer it to the Automobile Public under the following guarantee:

### GUARANTEE

If Emco Oil does not prove satisfactory to YOU in absolutely every respect, we will refund your money in FULL—pay freight (both ways if oil is returned) and make no charge for oil used in trial.

If your dealer cannot supply you, we will ship Emco direct to you in five or ten gallon cans, barrels or half barrels.

### EMERY MANUFACTURING COMPANY

LEWIS EMERY, JR., Proprietor.

General Offices: 47 Main Street, Bradford, Pa.

Strictly independent refiners, manufacturing Deodorized Gasoline and Lubricating Oils of every description.

New York Branch:  
1010 U. S. Rubber  
Bldg., 58th and  
Broadway.

References:—  
Dun's, Bradstreet's  
or any National  
Bank.

# J. M. The proved - and approved - Shock Absorber

*Why is the J. M. Shock Absorber the most frequently imitated of any shock absorber on the market?*

For the same reason that counterfeiters imitate United States currency instead of Confederate money—because the

## J. M. SHOCK ABSORBER

*is the universally accepted standard*

Note that “universally,” please—remember that no other shock absorber has received even a fraction of the world-wide approval that the J. M. enjoys. Wherever civilization reigns, wherever automobiles run—the J. M. Shock Absorber is found on the best motor cars.

Nothing but proven merit can so standardize any article. The J. M. has based its case on scientific facts—not mere claims and generalizations. It has proved its case on all sorts and conditions of roads.

Have you seen the

## Wonderful Graphic Record of J. M. Efficiency

drawn by the auto itself,—the proof which convinced Earle M. Ovington, the famous aviator and technical expert? Have you heard why Westgard, the veteran pathfinder of the A. A. A., and Kohl, the ‘round-the-world motorist, both place absolute reliance on J. M. Shock Absorbers?

If not, write for our free booklet “D”—today, or call at any of the J. M. agencies. There is one in every leading city.

## The J. M. Shock Absorber Co., Inc.

210 S. 17th St., Philadelphia

## Dam that leak

Do it with Se-ment-ol. Pour it into your radiator. It dissolves in the water, flows thru the cooling system. Cooled by the air when it strikes the leak it congeals and cements the cavity making a permanent repair.

After the cement has "set" drain radiator and re-fill with fresh water.

CARBONOX—The logical carbon remover. Does not dissolve the carbon; but attacks the "charred" oil that binds the flakes of carbon to one another and to the metal. The loosened carbon is then blown out thru the exhaust.

Price 75¢ at dealers.

## The ONLY plug guaranteed for 10,000 miles

Here's a guarantee that really means something. No ifs nor buts. No special clauses. No strings of any kind. We guarantee 10,000 miles of service for every

### J-M SPARK PLUG

If it fails to make good you get another plug. The only plug sold with such a definite guarantee. It is also the only plug with a *double insulation*—mica wound around the electrode, and a porcelain shell over the mica. Either of these insulations is sufficient to insure perfect sparking without short circuit—even when current is supplied by a magneto.

All sizes can be used for battery or magneto ignition. Sold by most dealers, or shipped prepaid. Price \$1.00 each.

Write nearest branch for booklet.

## HAVOLINE OIL

For Perfect  
Lubrication of  
Automobile

And Marine  
Gasoline Engines

This OIL is NOT AN EXPERIMENT, here today and gone tomorrow, but has for many years maintained the highest reputation as a scientifically prepared lubricant which is properly filtered, so that it burns clean, without leaving carbon deposits on plugs or cylinders.

The biggest engine manufacturers in the East and in the West recommend it; thousands use it on Touring and Racing Automobiles, and Working, Cruising and Racing Motor Boats, and all are pleased to find that

# The Standard Brake Lining

Every Industry Has Its Standard. In  
Brake Lining Circles The Standard Is

TRADE MARK  
**Raybestos**  
REG. U.S. PAT. OFF.

**"THE ORIGINAL AND BEST ASBESTOS BRAKE LINING"**

RAYBESTOS is the original heat-proof facing. By scientific weaving, rolling and treating, RAYBESTOS becomes a wall of strength, capable of resisting intense heat.

There are on the market many cotton linings. They are cheaper than RAYBESTOS but soon burn out. Asbestos, which cannot burn, is the base of RAYBESTOS.

The motorist, dealer, manufacturer, ALL realize the predominance of RAYBESTOS. It grips and holds—it is always ready for service.

When you overhaul your brakes demand RAYBESTOS. A little care in this will save you trouble and expense later on.

## "What Can I Do to Pull People In?"

This was one auto dealer's problem as he stood in the door of his salesroom and watched the people go by. "If I could get one prospect out of one hundred to come in and see my car, I could retire in a few years."

THE CAR THAT DRAWS THE BUYERS—

# HAYNES

*America's First Car*

## With the Vulcan Electric Gear Shift

Automobilists want to see this car as much as you want them to. Car owners again in the market are especially interested in the Haynes. They realize the convenience and comfort of simply pressing a push-button instead of tugging at a refractory gear lever and making monkeys of themselves when slowed down by traffic or climbing hills.

### Specifications of the New Haynes

**Motor**—Bore 4 1-4 in., Stroke 5 1-2 in. L-head Haynes. Cylinders cast in pairs. Model 26, A.L.A.M., 43.35 H. P., Dynamometer 65 H. P. Model 27, A.L.A.M., 43.35 H. P., Dynamometer 65 H. P. Model 28, A.L.A.M., 29.9 H. P., Dynamometer 48 H. P.

**Weight**—Model 26, 3800 lbs., Model 27, 4000 lbs., Model 28, 3400 lbs.

**Cooling**—Centrifugal pump and pressed steel fan.

**Wheel Base**—Model 26, 130. Model 27, 136. Model 28, 118.

**Ignition**—American Simms' Magneto.

**Carburetor**—Stromberg.

**Lubrication**—Splash and gravity feed.

**Control**—Left hand. Vulcan Electric Gear Shift.

**Transmission**—Selective Type, three speeds forward, one reverse.

**Steering Column**—Worm and worm gear type.

**Clutch**—Haynes contracting steel band.

**Rear Axle**—Full Floating Timken on Models 26 and 27; McCue, Model 28, Gourney Bearings.

**Front Axle**—I-Beam. O. H. steel heat treated.

Hand lever shift optional at \$200 reduction.

**Wheels**—Artillery type. Funk demountable rims.

**Tires**—Models 26 and 27, 36x4 1-2. Model 28, 34x4.

**Springs**—Front Semi-elliptic 39 1/4x2, rear 48x2.

**Brakes**—15 1-4 external and 15 internal Models 26 and 27. 12 and 16 internal on Model 28.

**Finish**—Indiana dark blue body. Pacific Tour gray, optional.

**Gasoline Feed**—Pressure, Automatic feed.

**Upholstery**—Buffed leather. Deep cushions.

**Starting and Lighting**—Leece-Neville electrical system.

**Cowl-board Equipment**—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge and speedometer. Models 26 and 27 have rim wind clock.

**Other Standard Equipment**—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind-shield, Vulcan Electric Gear Shift, two large electric head lights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 12 volt, 80 ampere hour storage battery, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim and Collins curtains. Models 26 and 27 have shock absorbers.

The Haynes salesroom is the Mecca of automobile prospects and sales are being made quick and frequent

When Writing to Advertisers, Please Mention The Automobile Journal.

# GET HEP!

## No high cost of selling among Haynes dealers

The cost of selling automobiles has steadily advanced. Instead of handing them out in first-come-first-served order, most automobile dealers face a serious problem in disposing of their cars.

There's no "getting-rid" problem for Haynes dealers. The cars are literally selling themselves.

## No come-backs, either

Haynes cars stay sold. No continual, annoying returns on the part of Haynes buyers for petty repairs and adjustments. Haynes cars are so simple, so strong, so fool-proof that they reduce the come-backs to almost nothing.

**And the season's greatest selling feature  
to help you**

## The Vulcan Electric Gear Shift

is a thoroughly proven success—entirely worthy of a place in the Haynes. It is 100% efficient and the slickest working bit of mechanism you ever laid eyes on. It is creating all kinds of business for Haynes dealers. It is a ten-strike—get it working for you.

**The Haynes Automobile Co., 6 Main St., Kokomo, Indiana**

**Model 28**—118-in. wheelbase,  
4-cylinder. Biddle & Smart  
coupe body. Price, **\$2700**

The tendency toward all-metal construction has become an irresistible movement in all lines of building. Steel is used for the framework of buildings, bridges, etc. It provides protection against fire and elements and makes open, web-like construction possible, at the same time supplying the means of securing flexibility required by any structural work which carries a tremendous load.

In almost every means of transportation, railway coaches, steamships, automobiles, etc., where high speed is required steel construction demonstrates its superiority over wood. While the more compact construction made possible by the use of steel is desirable, its greatest benefit is the factor of safety that accrues.

Wire wheels are the last and most important wood replacement in automobile development, the last step in making the motor car what it should be, a creature of steel throughout.

McCue Wire Wheels are built along the most modern conception of wire wheel construction. Standard S spokes, made by the Standard Company of Torrington, Conn., are used. With McCue Wire Wheels the weight of the car is suspended equally from all points on the rim and the rim itself, impervious to weather, is light, thus relieving the tire of the extra pound, pound, pound which the heavy wooden rim subjects it to. Steel rims also conduct the molecular and frictional heat away from tires and prolong their life more than fifty per cent.

McCue Wire Wheels provide a factor of safety in proportion to their strength—seven times that of wooden wheels in their capacity to support loads, and fifteen times the strength of wooden wheels to resist side thrust such as comes from skidding, etc.

Write us for booklet describing the development of wire wheels, causes which brought about their use, and their superiority when compared with the ordinary artillery type wheel.

# COES

## THE Wrench Supreme

Strength without bulk or clumsiness.

Ease of handling without slipping or bruising.

Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

Send for Literature Now.

# Stewart Speedometer

MAGNETIC PRINCIPLE

## The most important miles on the dial

One of the most important speeds a car *must* maintain—and must have indicated *exactly* in order to maintain—is the low speed required by city traffic rules which is often as low as 6 miles per hour.

The *only* instrument that indicates these low speeds is the *magnetic type* speedometer.

No other speedometer shows any sign of life until its whirling parts have enough momentum—never under seven to fourteen miles per hour.

The magnetic Stewart begins to register when the car begins to move. It accurately and unfailingly indicates speed *from zero up*. It is the only speedometer which surely indicates every mile or fraction below fourteen miles—the most important miles on the dial.

This is another reason for the 800,000 Stewart Speedometers in use compared to the 200,000 of all other makes combined.

See that you have a Stewart on *your* car.

### The Stewart Speedometer Factory

1926 Diversey Boulevard, Chicago, U. S. A.

Service Stations in all important cities all over the world

# Three Autos Are Owned in Brookline for Every Four Families in the Town

Brookline, Mass., is the richest town in the world; its assessed valuation is \$111,000,000; it leads the country in preponderance of women among its population.

*In this town there are 74 Boston Heralds (including evening edition) bought and read every day, for every hundred families.*

The Boston Herald has compiled a booklet which tells how many autos are owned in the 48 cities and towns that make up Greater Boston. The booklet gives, besides, much other information that every automobile advertiser should possess himself of.

If you are interested, write to Advertising Manager, The Boston Herald, and ask for

**“A Handbook for Advertisers.”**

# 10 Automobile Mechanical Books 10

ENGINE—MAGNETO—CARBURETOR—BATTERY—ELECTRIC LIGHTING—TIRES—CHASSIS  
—OPERATION—OVERHAULING, REBUILDING AND REPAIRING—THE MOTORCYCLE.

## Automobile Mechanical Books

### A Library of Automobile Mechanical Information

800 Pages of Text—1500 Illustrations—Half a Million Copies Sold Annually.

Knowledge of your car means additional pleasure in its use and decreased cost in operation and maintenance. The practical instruction that you need is to be found in these books, and to acquire the same fund of information in any other manner would require years of constant study. You must understand your motor if you would adjust or repair it. The subject is fully treated in the Engine book. This applies as well to the Magneto, Carburetor, Battery, Lighting, Chassis and Tire books. When overhauling and rebuilding, read that discussion. The book on Motor Car Operation covers that subject with reference to all cars. No matter what the need, there is a book to meet it. No car or component is neglected, and all standard engines, magnetos, carburetors, batteries, lighting systems and vehicles are dealt with. The full set includes:

# EMPIRE

*"The Little Aristocrat"*

**THE** Empire "31" had proved itself a masterpiece of engineering skill and the most solidly constructed car of moderate price.

Its marvelous run in the Indiana-Pacific Tour from Indianapolis to the finish at Los Angeles in perfect condition is a record never before achieved by a car of its size and power.

Empire Dealers and owners all over the country are enthusiastic over the service given by this car and are coming back for more Empires.

When we launched this model we went out for the progressive dealers who knew cars and the public's demand. In two months we were swamped with orders which left hundreds of dealers without Empire contracts.

We immediately began to plan for increased 1914 production. Now, after months of preparation we are turning out four times as many cars and we are consequently in a position to allot territory which we could not supply last season.

In every important territory where we have distributors we have had in the last few months solicitous notes from other dealers who realized too late the popular success of the Empire.

There is still some open territory, but it won't last long. Tomorrow may be too late to secure territory now open.

*Write for advance folder for 1914.*

## PUBLISHER'S COMMENT.

The Annual Electric Vehicle Number of Motor Truck, October issue, undoubtedly will prove of great interest to the thousands of readers of The Automobile Journal. No special edition ever published by a commercial car journal will equal this number, either in character or value of contents. It will be an invaluable book of reference, because of the scope of the special articles dealing with the construction, care, operation and maintenance of electrically propelled machines, prepared by the most widely known men in all branches of the industry. The price of 15 cents a copy will not be advanced. Order now—direct, or through your news dealer.

In these days of comfort and convenience in motoring, automobile owners are particularly interested in the new things offered by manufacturers of accessories and supplies. The special department devoted to this subject, on pages 35-36-37, is worthy of your careful attention.

The increasing interest in the cyclecar has made it imperative that The Automobile Journal create a new department for its consideration. The first mechanical descriptions of this newest feature of the automobile industry are to be found on pages 51-52-53.

When in need of new fittings or supplies, or when considering the purchase of a new car or truck, always consult the Buyer's Reference and Guide, beginning on page 87. The concerns represented therein have gained a reputation for standard products that merits your attention and patronage.

### An Invitation to Manufacturers of Electric Lighting Systems

Certain manufacturers of electric lighting systems have endeavored to overcome the showing of the Speedway Tests by preparing mysterious charts of engineering curves and making plenty of lead pencil figures.

Anyone can test the proposition of "miles per gallon" with a lead pencil. But it can be done more accurately with an automobile.

We cordially invite any manufacturer of electric lighting equipment who wants to prove its power consumption on these Speedway curves to bring a car with his equipment to the Speedway and give it a practical test.

We shall be glad to furnish the gasoline and all necessary mechanical help. We also have two electrical engineers and a few electricians whom we have found handy in case of electrical troubles on cars being tested.

The only recompense we ask is a copy of the report of the test, certified by the manufacturer of the electric equipment.

Here is a splendid opportunity for any electric lighting equipment manufacturer to show whether his lead pencil theory will hold together on the brick speedway.

## "What is the **BEST** Light for My Car?"

Here is an accurate analysis of automobile lighting systems.

It tells facts—

Not theoretical "curves" or technical "figures" but—

Real tests of cars in service—indisputable information about the best light for your car.

It tells why electric equipment cripples an engine—

Why electric light costs more than Prest-O-Lite—

What expert electricians say about electric lights on automobiles.

It proves why Prest-O-Lite is more reliable, just as convenient and gives a better quality of light than any electric system.

It shows why some automobile manufacturers use electric equipment.

It gives inside facts about self-starters.

It recounts real results of the experience of owners with electric lights.

### These **FACTS** Save You Time, Money, Trouble.

If you own a car or buy one you will benefit by every page.

Here is the evidence.

You are the jury.

Before you give your verdict, read these facts.

The coupon or a post card brings them to you.

**The Prest-O-Lite Co., Inc.,** 226 Speedway, INDIANAPOLIS, IND.

Exchange Agencies Everywhere

The new Prest-O-Lite factory, which multiplied our capacity 4 times, is running to the limit endeavoring to keep up with the demand for Prest-O-Lite.

The Prest-O-Lite Co., Inc.,  
226 Speedway, Indianapolis, Indiana.

**Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life**

*The above picture* illustrates one of the numerous situations in which you may be placed during bad road weather—when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping all tires with

## Weed Anti-Skid Chains

*The Only Device that absolutely Prevents Skidding*

No matter how expert and careful you are when driving on wet pavements and muddy roads, the treacherous bare tires are a handicap that defeats your very best efforts to prevent a skid.

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring

forever after, when *safety can surely be yours by equipping all four tires with WEED CHAINS?*

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

## THE NATIONAL HIGHWAYS ASSOCIATION.

**An Organization Fostering a Great Public Movement for the Construction and Maintenance of Trunk Highways at Federal Expense—Outlining Its Purposes and the Methods by Which It Expects to Attain Success.**

**W**HILE motorists, especially, have come to realize the importance of giving consideration to the wise application of the funds available for good roads, few have appreciated the magnitude of the subject. That the time is fast approaching, if indeed it is not already here, when the general public is to become actively interested in the matter, is borne out by the remarkable growth of the National Highways Association. This organization was perfected and the association incorporated under the laws of the District of Columbia early in 1912. Less than two years, therefore, have been devoted to the promulgation of its aims and purposes. Today, its membership approaches the 100,000 mark—a certain indication of the immense popularity of its position regarding this important matter.

Every great public movement has its inception in the mind of some individual, and its success or failure depends largely upon the personality of that individual. The Na-

tional Highways Association surely is a great public movement. It had its inception in the mind of Charles Henry Davis, and since the personality of this man must be reflected in its objects and the methods of attaining results, the history of the association begins with that of Mr. Davis.

**Charles Henry Davis, C. E., Founder and President, National Highways Association.**

Charles Henry Davis has personally, or by inheritance, been identified, directly or indirectly, with road building for three generations, or substantially since roads, as such, were built in this country. His grandfather, Edward Morris Davis of Philadelphia, early became identified with road construction work in a commercial way. This commercial interest was maintained and further developed by a son, Henry Corbit Davis, and, naturally, the grandson not only inherited the business, but still further developed its possibilities.

Through this connection, Charles Henry Davis became decidedly active in the general good roads movement throughout the country, with a

**Poor Road—Slippery Surface—Dangerous.**

splendid opportunity to study the needs of the people in this regard. It was while thus engaged that it was made apparent to him that the national government should participate in highway building. Careful consideration of the subject from all its angles led him to the conclusion that the only method of convincing the body politic was through the formation of an association devoted to such a cause. As a result the National Highways Association was founded, and shortly thereafter he disposed entirely of his interests in the business, so that the new association should be absolutely divorced from commercialism in all its phases.

Mr. Davis is a very wealthy man, and, because of his prominence in the industrial world, he had little difficulty in interesting and securing the assistance, from the first, of a large number of men somewhat similarly situated. Gen. Coleman Du Pont, United States senator from Delaware, and a man who has taken a deep interest in good roads, having presented his home state

with an improved highway extending from one end of the commonwealth to the other, became chairman of the board of councillors. For a time Mr. Davis hesitated to accept the presidency, but his associates very soon assured him that the success of the organization depended very largely upon its proper direction, and that it was his duty as founder to accept this responsibility.

It will be seen that Mr. Davis already had arranged his business activities so that he could devote a major portion of his time to the association. He not only has done this, but he has contributed largely from his private fortune to the needs of the organization, so that the present growth is in no small measure due to his untiring efforts in its behalf.

The National Highways Association came into being at a time when the value of good roads had received general acknowledgment. The work

**Poor Roads—Farm to Railroad—Poor Way.**

accomplished by organized motorists and others had brought the matter to the attention of the public in such manner as to leave no doubt as to the advisability of investing funds in permanent ways. The purpose of the new association was in the nature of an advance step, in that it aimed to find the proper solution of the problem presented through the wise application of the funds available or to be made available.

Supplementing the work of other organizations, the National Highway Association has sought to bring directly home to the motorist, the farmer, the business man, and all interests, the advisability of securing improved highways as quickly as may be practical. To this end, the situation has been given very careful study. Contrasting pictures, examples of which are shown herewith, have played their part in awakening popular interest in this phase.

The association believes in a national high-

**Good Road—Good Surface—Safe.**

ways system. It states its position with respect to the situation as follows:

Whether the national government shall or shall not help in the construction of the highways of the nation is of vital and pressing importance to all our people. France, Germany, England, and, in fact, most European countries, have great highways. In the United States no such roads exist to any relative extent. We grew as a nation with the industrial growth of the world. About 1831, when we were young, railroads and street railroads were first built. A little later came the telegraph, and then the telephone. We likewise had great rivers, such as did not exist in many other industrial nations. These five means of transportation had a tendency to confine our road building to local centres. In Europe, the need of intercommunication came before the use of steam or electricity. Hence the earlier growth of road building on that continent.

We have over 2,000,000 miles of highways in the United States. The excess over 2,000,000 miles is, approximately, the only part of this vast system of roads which can be considered as improved—and these are not permanently improved. The cost of improving this 2,000,000 miles can be estimated as somewhere between a minimum of \$6,000,000,000 and \$20,000,000,000 or more.

The improvement of these highways will not come at once, either in time or, on first building, in permanence.

**Poor Road—Time Is Money—Delay Means Dollars.**

Economic, because of the nation-wide reduction in cost of distribution which will be attained. Social, because of the opportunity and encouragement to the country folk to come in contact with their fellow men, women and children—especially the last two. They can get this by no other means. Such a great question should not be lightly decided. No large appropriation should be made without deep study and forethought—without knowing the way we should go and where we should land.

The National Highways Association and other advocates of national roads favor the construction of a system of trunk lines—about 50,000 miles in all—connecting the principal cities of the country, entirely at the expense of the government and under government control. These advocates believe that the states should build certain secondary roads entirely at the state's expense and under state control; and that the counties should build a third class of roads entirely at the county's expense and under county control. This, in a general way, is the plan on which the French road system is based.

The advocates of federal aid for road building do not favor the construction of transcontinental trunk lines for highways at the government's expense. They believe that the government should go into partnership with the states and should pay either a per cent. or a fixed amount a mile for various hard roads; that the government should apportion its money among the states and let the states spend it.

On a small scale, this experiment of giving aid has been tried both by counties and states. In this country roads were first built by the small communities, villages, towns and townships. Some of these communities built them well and maintained them well. Others did not. Those that had good roads found business gravitating to them. They found that about three-quarters of the traffic

**Good Roads—Farm to Railroad—Good Way.**

Their history will be that of railroads—constant rebuilding and improvement. Add to either figure of cost what the imagination may choose to add and we have a future expenditure on the highways of the nation greater than the present investment in all other means of intercommunication—railroads, trolleys, telegraph, telephone, horse and power vehicles, and the postal service. This expenditure will cover many years; if accomplished within the same period as our railroad development, then about 80 years. The wise planning and building of these highways is an important public duty.

In maintaining that the national government should join in road building, the National Highways Association differs from other organizations in the plan to be adopted. One class asks for federal aid, in which government appropriations are to be apportioned among the states to be spent on state roads. This association stands for a system of national highways, built and maintained by the national government. Concerning this phase it expresses itself as follows:

The subject is one of the greatest, material, economic and social questions to be rightly solved by the nation. Material, because of the vast sums to be expended.

**Good Road—Time Is Money—No Delay.**

Gen. Coleman Du Pont, Chairman,  
Board of Councillors.

certainly, not good roads. In many cases, more than half of the money was wasted; half of it never got to roads. Under those circumstances the people soon began to demand that the counties should build county highways, and this the counties did to advantage; that is, county roads were built and paid for by the county. The county engineers and commissioners had charge of the spending of the money and maintenance of the roads, and all was well once more until something happened.

History repeated itself. Those counties that built county roads found that business gravitated to them from adjacent counties. Large communities developed within counties where good roads were built and maintained, and the growth of these large communities brought more people to that county and more business. Soon about three-quarters of the traffic over these county roads came from adjacent counties that did not help build or maintain these roads. The counties at once applied to the state, and curiously enough the same mistake was made as that which had been made before. The states gave aid to the counties, and again graft and corruption developed, and not good roads. And again, half of the money never went to roads. Then people demanded that the state should take over state highways and build and maintain them through a central body, by furnishing the

over their roads came from adjacent communities that did not help pay for the roads. Trouble ensued at once, with the result that the town applied to the county for assistance on the ground that the entire county was using these good roads and, therefore, must help pay for them and maintain them.

At first the county responded by what was known as county aid. That is, the county appropriated money. The money went to the town authorities and they spent it. But this was found undesirable, because it encouraged graft and corruption and all that went with these things, and did not go into roads—certainly, not good roads.

engineers, letting the contracts, inspecting the work and maintaining the roads.

Most, if not all, states that have tried state aid have found it practically unworkable, not only because of the dual means of raising funds jointly through the states and counties, and, sometimes, municipalities and individual assessments, but also because of the conflict of management between the several organizations of the government. Accordingly, most of the states have turned to state highway construction without the assistance of county, city or village finance or authority.

Having presented its arguments, the National Highways Association lays before the public its plan for accomplishing that which it believes desirable. It maintains that the building of these trunk highways must be done by the national government

A. L. Westgard, Vice President.

work has been undertaken, and no large appropriation has been made therefor without a careful preliminary investigation and report to Congress, thus enabling that body to act wisely and with discretion. To this end the association has prepared and had introduced in Congress, the following bill "to create a national highways commission and prescribing its powers and duties":

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

Section 1. That a commission is hereby created, to be called the "National Highways Commission," to investigate, collect information and report to Congress on the highways of the United States, together with recommendations as to the proper policy of the national government in respect thereto (whether by the establishment of a system of national highways or by federal aid in the building of state roads or otherwise) and as to the most appropriate legislation to carry such policy into effect.

Sec. 2. That the national highways commission shall consist of a chairman as the executive head in responsible charge

General View of Association's "Workshop," South Yarmouth, Mass.

**The Drafting Room, Where Every Highway in the Country Is Plotted on Its Respective State Map, Constantly Revised and Corrected.**

thereof and 13 additional commissioners as an "advisory council."

Sec. 3. That the President, by and with the advice and consent of the Senate, shall appoint said commission as follows:

First: That the chairman shall be or have been an engineer by education and profession and shall be a man of executive and business experience.

Second: The chairman shall be selected from candidates nominated to the President, one by each of the following associations: (Such as, the American Society of Civil Engineers, the American Automobile Association, the American Road Builders' Association, the National Grange, Farmers' Union, and any other representative national associations specially concerned with highway development. In this section should also be suitable provision for the manner of making such nominations.)

Third. The 13 members of the advisory council shall be respectively qualified to represent the following interests in the body politic: (1) Agriculture, (2) commerce, (3) construction, (4) economics, (5) education, (6) engineering, (7) finance, (8) legislation, (9) maintenance and traffic, (10) materials and machinery, (11) military, (12) transportation, (13) travel, touring and recreation. (This enumeration is merely tentative; the intention being to name all of the general interests of the country which are directly concerned in the development of a system of national highways.)

Fourth. Vacancies occurring in the commission shall be filled in the same manner as hereinbefore provided for original appointments.

Fifth. Any member of the commission shall be subject to removal by the President for inefficiency, neglect of duty or malfeasance in office.

Sec. 4. That the chairman shall receive a salary of \_\_\_\_\_ dollars per annum and each other commissioner a salary of \_\_\_\_\_ dollars per annum.

Sec. 5. That the powers and duties of the chairman shall be: (In this section should follow an enumeration of powers and duties in sufficient detail to indicate the extent to which the commission is required to investigate and to give the chairman the fullest possible power to carry out such investigation. The following points in particular should be covered: (1) Executive direction of work; (2) appointment and removal of employees; (3) providing offices, laboratories, etc.; (4) collection, tabulation and publication of information, including experimental work, surveys, etc.; (5) obtaining information and co-operation from

governmental departments; (6) incurring necessary expense; (7) preparing and submitting a complete final report with recommendations.)

Sec. 6. That the duty of the advisory council shall be to assist the chairman as he may direct and to advise with him at his request or on their own initiative.

Sec. 7. That the term of office of the commissioners and their successors appointed hereunder shall end upon the delivery of their final report to the President, but not later in any event than \_\_\_\_\_ 19\_\_\_\_.

Sec. 8. That for the purpose of carrying out the provisions of this act, there is hereby appropriated the sum of \_\_\_\_\_ dollars, out of any money in the treasury not otherwise appropriated.

Sec. 9. That this act shall be known as the national highways act; and shall take effect upon its passage.

In the meantime, the association is carrying on the necessary campaign of education. Its headquarters for this purpose are located at South Yarmouth, Mass.—on quiet

Cape Cod. Here, on property donated to the use of the association, by President Davis, has been erected a work shop, made up of several buildings which have been joined so as to present a novel and interesting establishment.

The main office building is a long, low structure, 127 by 34 feet. Down the entire length of this room, on one side, are the drafting tables. On the other side are the desks occupied by the association's publicity department. Down the middle of the room is a long file of safes and filing cabinets. At right angles to this office runs another long building, almost as large, in which are the office of the president, the mailing room, the filing room and the shipping departments. Connected with this, by a passageway, is the stenog-

**The Printing Department, in Which the Latest Mechanical Equipment Is Utilized in Issuing Circular Letters and Press Bulletins.**

**The Stenographers' Room, Where the Rapidly Increasing Correspondence of the Association Is Handled.**

raphers' room, and adjoining that is the printing department, where the latest and most improved mechanical equipment has been installed. Here are printed and distributed various circular letters and bulletins, the work of printing, folding, sealing and stamping being done by automatic machines.

Nearly 40 persons are employed at the South Yarmouth establishment, and none the least important of these is the corps of eight draftsmen. These men have long been engaged upon the production of road maps, delineating thereon the existing roads in every state in the Union. The association is in constant correspondence with the highway commissioners and officials of all the states. The maps are always up-to-date, every piece of highway work contemplated or under construction being reported immediately to the association and transcribed to its proper place on the map of that state. These maps will prove of inestimable value to the proposed national highways commission, and in addition will be of service in showing the people of each state how the national government can make use of their roads in the proposed plan.

This is the workshop of the association. Other offices are maintained throughout the country. The actual headquarters of the association are located in the McLachlen building, Washington, D. C. A branch office, of the privileges of which the members of the associa-

tion are urgently invited to avail themselves, is maintained at 18 Old Slip, New York City. The headquarters of the organization department, which is under the direction of the Hon. Jesse Taylor, are at 515 Hartman building, Chicago. A large corps of workers is under Mr. Taylor's direction, among these being O. W. Gruening, manager of the northwestern organization department, in the Des Moines Life building, Des Moines, Ia.; E. L. Emery, field organizer for the intermountain district, at Boise, Idaho, and the Hon. W. A. Alsdorf, manager of the northeastern organization department, whose territory covers the Atlantic states.

Probably no one man connected with the association in an official capacity is better known among motorists than Vice President A. L. Westgard, who is at present engaged in traversing some 17,000 miles of roads throughout the entire country. This is by no means new work for Mr. Westgard, who has intimate, personal knowledge of practically every highway worthy the name in the United States, through his pathfinding trips during the past 21 years. For 13 years, between 1892 and 1905, he had charge, as chief of the work, of a large corps of engineers, making state, county and town maps and atlases throughout all the states east of the Rockies. The first automobile maps of the eastern states were made by him. Mr. Westgard's co-operation with the drafting department of the

**A Portion of the Filing Department, Where the Data Compiled by the Association Are Instantly Available at All Times.**

association, makes this feature of the work of undoubted worth.

The association has eight classes of membership as follows: Founders, who pay \$25,000 in one payment for life; national, \$10,000; collective (corporations, etc.), \$2500; life, \$1000; sustaining, \$100 annually; contributing, \$10 annually; assisting, \$5 annually; and subscribing, \$1 annually. In addition there is an associate membership for men, women and children, without the right to vote, with dues of 50 cents a year. The founders, limited to 53, are distributed geographically, so far as possible and represent the nation at large. The national members are limited to two from each state, territory or dependency of the United States.

Already several good roads associations throughout the country have become affiliated with the national body, becoming either departments or divisions of the parent association. One of the most effective branches of the organization is the council of governors, composed of the present governors of 44 states and territorial divisions of the United States, and it is anticipated that shortly this list will be increased to include them all.

The officers of the association are: President, Charles Henry Davis, C. E.; chairman, board of councillors, Gen. Coleman Du Pont; vice presidents, A. L. Westgard; Dr. Lucien Peters McCala, Boise, Idaho; Judge J. M. Lowe, Kansas City, Mo.; Jesse Taylor, Jamestown, O.; general secretary, Frederic Remsen Hutton, M. E.; assistant treasurer, Francis Hill Bigelow; consulting engineer, Arthur H. Blanchard, C. E., New York City; secretary, board of councillors, Elias Vander Horst, C. E., New York City; engineer, board of councillors, Timothy W. Sprague, Boston; director of publicity, C. H. Claudy, Washington, D. C.

The magnitude of the undertaking is at once apparent. These men and those associated with them must be regarded as the pioneers in a movement which is expected to result in immense value to the nation as a whole. The work, in spite of the wonderful progress that has been made within the past two years, has really only just begun. It is pointed out that the passage of the proposed bill will in no wise commit the federal government to the policy of the association in its final analysis, although, of course, those who advocate national highways built and maintained by the national government anticipate there will be no difficulty in demonstrating to the satisfaction of such a commission that this is the only proper method of procedure.

## DOTY IS NOW MANAGER.

### Succeeds Webb Jay as Head of Chicago Haynes Motor Car Company.

Webb Jay, vice president and manager of the Haynes Motor Car Company, Chicago, distributor for Haynes automobiles in Iowa, Illinois, Wisconsin and a part of Indiana, has disposed of his holdings in the concern, and has been succeeded as manager by Harry E. Doty. Mr. Doty has been connected with the automobile industry and kindred lines practically since he left college, and has a large number of friends all over the Middle West.

His first job was railroading. Then he became a salesman for the Liberty Cycle Company of Chicago, winning the position of western manager. Graduating from that business, he accepted a similar position with the Consolidated Rubber Tire Company, where he remained for 6.5 years. Later he became identified directly with the automobile business and became Pacific Coast manager of a manufacturing concern, which position he relinquished to join the Chicago selling company about a year ago. When a new manager was needed, it is stated that no other person was considered.

## WITH HANDLEY COMPANY.

### E. H. Horton and T. O. Jones Assume New Duties with This Organization.

The J. I. Handley Company, Indianapolis, Ind., sole selling agent for Marion and American cars, announces the appointment of E. H. Horton as sales manager of the Marion division, and T. O. Jones as publicity manager. Both men are recent acquisitions from the R-C-H Corporation of Detroit.

Mr. Horton was sales manager of the R-C-H organization since its formation, meeting with decided success in marketing the product of this concern. Previously he had been connected with the sales department of the Chalmers Motor Company. Mr. Jones is one of the best known publicity men in the industry. His early experience was gained in five years of newspaper work in Columbus, Grand Rapids and Detroit. He then became publicity manager for the Hupp Motor Car Company, being one of a party of three which made a trip around the world in a little Hupmobile in 1910 and 1911. He joined the R-C-H organization at its formation.

## COOLING BY WATER INJECTION.

IN A paper read by Prof. Bertram Hopkinson, F. R. S., of Cambridge University, England, at a meeting of the Institution of Mechanical Engineers at Cambridge, the results of a series of experiments in a new method of cooling gasoline engines were outlined. Instead of utilizing jackets or fins, the water is introduced in the

Fig. 1—Engine Pressure Diagram.

form of spray into the combustion chamber, but only injected during the ignition or expansion of the mixture. Prof. Hopkinson has built a number of engines utilizing this principle and it is stated that from 12 to 14 per cent. more horsepower is obtained, and that carbon is almost unknown. The consumption of water is 2.4 pounds a brake horsepower. The paper attracted considerable attention, and the subject is of interest to the designer and user, although it would appear after serious consideration that the plan of water injection involves complications. As the gaseous and physical conditions of the internal combustion engine are very similar in types of engines widely different in design, it will be necessary to make clear what it is that is required.

The energy in the fuel used in the ordinary motor car is obtained when a mixture of the gasoline and air is exploded or burned while under compression. Its temperature and, consequently, pressure rises in accordance with a definite law—more or less—depending on the practical working conditions. A large percentage of the fuel burned in this manner is lost; that is, it passes out to the atmosphere by means of the water jackets, radiator, etc., or, in other words, the heat units are not turned to useful work. In addition there is the factor of expense, also weight.

The average motorist does not consider the matter of cooling beyond maintaining the supply of water in the radiator and protecting the cooler in cold weather by the use of non-freezing solutions or covers, or both. The subject, however, is of importance, it being well known to engineers that an engine that is too cool results in inefficiency, as does a motor that is too hot. In view of the high cost of fuel the regulation of temperature is a subject that is receiving serious consideration.

To obtain almost ideal efficiency it is obvious-

ly necessary that the range or rise of explosion pressure should be as large as possible, so that losses may be reduced to a minimum in the ordinary engine, where the compression is constantly varying, due to the use of the throttle control. When the gaseous or semi-gaseous mass is ignited in the cylinder, the temperature rises to a maximum long before the piston has had time to move more than a very small proportion of its stroke. The cooler the mixture can be held without losing its form as a vapor, the larger will be the difference in temperature, and, similarly, the higher the independent temperature of the cylinder walls, the less will be the amount of heat wasted through them.

The explosion must be constrained in some way, and the faster the expansion is allowed to take place, the better will be the fuel efficiency, neglecting all else for the moment as remaining constant. It is obvious that the gas cannot be expanded until its pressure reaches that of atmospheric, because the pressure falls so fast that little work is done on the piston at the end of its stroke. It is largely for this reason that gearing is a necessity, and this is made very clear by an examination of an engine card or pressure diagram, which is frequently not unlike that at Fig. 1 in its main characteristics.

The removal of the heat by means of the water jacket is necessary to insure the maintenance of satisfactory lubrication; that is, to reduce friction losses. Air-cooled engines, if small, are perfectly satisfactory, running without trouble at twice the temperature of those water-cooled, and in sizes where the heat can be radiated fast enough to maintain lubrication and to prevent

Fig. 2—Water Injection in Large Oil and Gas Engines.

attenuation of the incoming charge by raising its temperature before explosion, efficiency would be reduced by water cooling. Over-cooled engines

are not uncommon nor were over-heated motors unknown several years ago.

Fig. 3—Dotted Line Indicates Jacket Cooling; Full Line, Internal Water Cooling.

On large motors the surface of the combustion chamber increases too slowly to cope with the volumetric increase, and it is necessary to remove a certain per cent. directly through the walls, because the temperature cannot be controlled. It may be either relatively too cold or too hot, and in spite of the great reduction in cylinder wall thicknesses now possible, it is necessary to keep the jacket water at a low temperature, not only to avoid evaporation, but to insure sufficient actual flow of heat from places where thickening occurs in the casting.

It seems fairly obvious that an attempt should be made in some way to utilize all this jacket heat in the motor, and, although this point was considered in the earliest days of the gas engine, it has never been given serious consideration for use on the automobile. Gaseous explosions, to be effective if all the charge be burnt at once, must be rapid, so much so that if the gases in an engine were not disturbed or turbulent, then explosion would not be fast enough to enable the power stroke to be completed in time. On account of this whirling, which brings the burning flame in contact with many places on the walls, the greater part of the heat given out to the cylinder itself is that absorbed during the existence of actual high temperature flame.

The existence of this rapid "knocking" explosion very naturally led to means by which it could be smoothed out and its pressure spread over a greater portion of the stroke. With this object in view, and also to obtain cooling to prevent warping and preignition, it has been the practise in large oil and gas engines to admit water or water dust and steam during the inlet stroke as indicated at Fig. 2, for cooling is a matter of great difficulty in large cylinders and necessitates constant running below maximum output and the use of separately cooled pistons and valves.

The report of Dr. Low of England, who has experimented with cooling engines by the injection of water, is of interest, and he states that cooling the gases behind the moving piston is not quite what is wanted to cool the engine. The cooling of these gases depends on the amount

of disassociation at combustion, the varying specific heat of the gases and water vapor injected or contained in the fuel, and many other causes, so that it is found to be really most effective to work on low temperature bases often impossible when high compression is needed to secure compactness of design.

In his report Dr. Low states:

It is wrong to cool only the burning gases by mixing steam with them, because in the evaporation of this water heat will be absorbed, doing work on the water only partially compensated for by any help due to its expansion pressure towards the end of the stroke. Preignition may be avoided, but there is another method which has been brought into prominence largely by the experiments of Prof. Hopkinson. Some years ago the writer was also much taken with the idea of an alternate steam and gas engine, an engine with a steam or red hot sided piston, or the use of water and fuel immediately together in a semi-flash boiler, and it is on these lines there is room for development.

The heat given to the engine walls is wasted. Why not absorb this heat by water, not using enough to allow it to give trouble as a liquid, but using the hot running gasoline engine to vaporize the water, keep the engine cool, and provide steam to raise the pressure of the expansion line without the presence of water existing as water and not steam, appreciably reducing the explosion temperature at a time when the heat is most rapidly being given to the cylinder walls.

An advantage could be obtained by cooling by water internally injected. It is quite clear that the water must be admitted so that it will not be evaporated by the flame, but by the walls, and it must, therefore, reach them as a liquid; it must not remain as a liquid, and must be controlled either by load or even by throttle opening or temperature or pressure regulation; it is, therefore, simple to direct it onto parts liable to warping, such as valves, or upon the parts exposed to intense heat in high pressure engines. The writer has made numerous experiments in this connection, especially, and as there would seem to be a feeling that the high pressure engine without the usual atmospheric or alleged carburetor will become not uncommon in the future on account of its efficiency and transmission effectiveness, it is instructive to remember that fuel and water may be injected together, partly disassociating the latter, reducing the engine temperature to such purpose that no water jacket is needed, even if not vapor cooled and whether the steam is condensed after or not, so raising the expansion averages that it would lead one to think that the gas turbine may resolve itself into a gasoline vapor and steam expansion turbine, both pressures being obtained from waste heat.

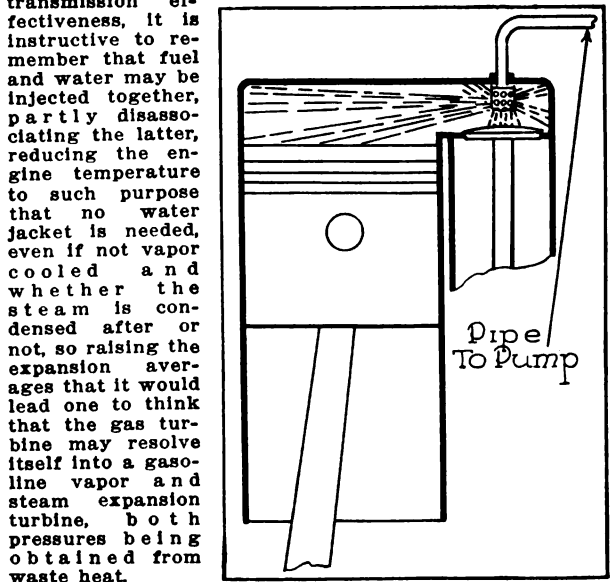

Fig. 4—Elementary Form of Water Injection.

It might even be possible to recover some of the water, especially in conjunction with a turbine engine, but we must remember that small volume cylinders must be kept usually at a lower temperature than that necessary for the highest efficiency; again, there seems reason to

suppose that the atmospheric engine may be superseded by a high compression type, doing away with the somewhat humorous carburetor, and in this case, although internal cooling would be very valuable, we might further help by the cooling effect of gasoline. It is, however, no use injecting the fuel or water direct into the cylinder, and if the fuel were to be injected in contact with the cylinder walls it would lead to burning and over-heating of the piston and cylinder without any corresponding rise in efficiency, owing to the fact that nearly all of the effective heat would be carried away through the metal.

Water injection to gasoline engines, where employed on motor cars, is a very different matter from its use on large gas engines. It sounds very nice to be able to cool a carboned piston and cylinder so well that incandescence, and consequent preignition, are avoided, but this is not to be done by sucking in a few drops of water. It means the use of a pump, and, although this might be pressure operated from exhaust or vapor jacket if in use, it is not a simple matter to design a distributing pump and pipework.

The alternate is to use the valves to admit water, but it must be properly sprayed in and spread, and if this means the use of a pump or valve on each cylinder, it will be as bad as a return to the low-tension ignition, as far as complication is concerned. On a large engine, where we have thick cylinders, the prevention of high spots is imperative for safety, but the success of injection cooling on light car engines is another matter. We have thin, easily warped cylinders, a mixture to keep cool which cannot properly be done by air outside or inside the cooling water, and a valve gear to keep accurately adjusted and unaffected by excessive expansion in the interests of silence.

Small, high speed engines can afford to sacrifice some cooling efficiency, and high speed pumps are not easy to keep in order; all this must be balanced up. To have a jacketless engine, much lighter, no freezing, no radiator, and no pumps, and an engine that will not knock easily is very attractive; it is quite possible and even probable that the injection engine will have its day, and, if not on the road, the aeroplane would give it a good outlet. Water is easily obtained, and not much is required in proportion to the weights of fuel and oil carried in the ordinary way. The subject is of undeniable interest to the designer and user alike. Fig. 4 shows the absolute simplicity of the proposition in its elementary form.

## AMERICAN ROAD CONGRESS.

### Everything in Readiness for the Big Meeting in Detroit.

Over 200,000 invitations have been issued throughout the United States and Canada to those interested in the third annual American road congress, to be held in Detroit, Sept. 29-Oct. 4. Early estimates of the probable attendance have been revised time and again. Arrangements are completed for handling one of the biggest crowds in the history of the American Highway Association, under whose auspices the event is to be held.

The list of speakers already has been announced in these columns and the features of the programme are such as are expected to interest all students of the problem of good roads and how to secure them. Perhaps the greatest interest, at this time, is felt in the election of officers for the ensuing year. The appointment of Thomas Nelson Page as ambassador to Italy will make it necessary to select a new chairman of the membership committee. The present officials are:

President, Logan Waller Page, director, United States office of public roads; vice president, W. W. Finley, president, Southern Railway Company; secretary, J. E. Pennybacker, Jr.; treasurer, Lee McClung; field secretary, Charles P. Light; chairman, board of directors, James S. Harlan, member, Interstate Commerce Commission.

## TESTING COLE SIX.

### New Model Being Subjected to Strenuous Work on the Pacific Coast.

According to reports received at the factory from C. S. Crawford, chief engineer of the Cole Motor Car Company, Indianapolis, the Cole transcontinental test car has been undergoing some strenuous work for the past several weeks. Crawford and his party, which includes H. C. Bradford, advertising manager, and Lew Pettijohn, chief tester, have been running the machine through very sandy and mountainous country in Oregon, Washington and British Columbia. More than 6500 miles have been covered, the last 3000 being over the northwest, including the desert land of eastern Oregon and twice over the Cascade mountains.

On the trip to Spokane the John Day grade, seven miles in length and conceded to be one of the steepest hills in the world, afforded an excellent opportunity to test the climbing ability of the new machine, as well as the brakes. It is said that the greater part of the ascent was made on the intermediate gear, and that in all tests the motor kept cool and the brakes worked perfectly. The return trip will be made over the northwest trail. The tour to the Pacific Coast was over the central transcontinental route.

R. S. Wiltrout, formerly manager of correspondence at the executive offices of the Stewart-Warner Speedometer Corporation, Chicago, is now connected with the John W. Blackledge Manufacturing Company, Chicago, maker of the Velvet shock absorbing springs, in the capacity of sales manager.

An address on the subject of good roads by O. L. Williams of Bowie, Texas, at Mexia, Texas, the lecture pertaining to highways from Colorado to the Gulf, resulted in the formation of a good roads organization. The following officers were elected: President, R. J. Jackson; vice president, T. B. Poindexter; secretary-treasurer, J. M. Blake. The organization will become affiliated with the state and national bodies.

## GENERAL NEWS OF THE INDUSTRY.

**Is the Standard Oil Company to Engage in the Manufacture of Automobiles?—Production of Alco Trucks May Be Revived—Demise of George W. Bennett.**

**W**HETHER or not the Standard Oil Company is to enter the industry as a producer of automobiles has been a subject of concern among manufacturers and owners for some little time. Earlier in the month, various newspapers throughout the country chronicled the organization of the Rockefeller Motor Company in Cleveland, O. The concern was said to have been incorporated with nominal capital, the incorporators being Sterling Newell, F. S. Whitcomb, R. F. Denison, Ellis R. Diehm and Thomas F. Fay. With the exception of Fay, these were understood to be members of a law firm closely connected with Standard Oil interests. Fay was formerly editor of a large automobile trade publication.

According to the original dispatch, this concern was to take over the Goby Engine Company of Cleveland, a company recently formed to produce the Goby single sliding sleeve engine, and also to produce a kerosene burning engine. It was further intimated that cars ranging in price from \$350 to \$1000 would be produced, these to be capable of averaging 50 miles on a gallon of kerosene or gasoline.

Letters addressed to the Rockefeller Motor Company and the Goby Engine Company have failed to elicit information. But a subsequent Cleveland dispatch denies certain portions of the original story. It is now maintained that the attorneys interested in the Rockefeller company are in no way connected with John D. Rockefeller or the Standard Oil Company. The name is said to have been chosen from the fact that the company will occupy offices in the Rockefeller building.

Despite the denials, the Wall Street Journal says it will not be surprising to see interests allied with the Standard Oil Company eventually become identified in a large way with the manufacture of automobiles. In a dispatch from Boston, this organ publishes the following:

Men connected with Standard Oil are understood to have made an effort several months ago to get control of the Ford Motor Company, the country's largest motor car producer, but Henry Ford, its chief owner, is said to have refused to sell at any price. Within a few weeks Standard Oil money has been picking up the common stock of one of the four largest automobile companies in the country with a production of about 35,000 cars per annum. It is too early yet to say whether a controlling interest is what the Standard capitalists are after. It is also understood that Standard Oil money has made some

headway in buying into another automobile enterprise.

The reason for Standard Oil's interest in automobiles is believed to lie in the huge surplus stocks of kerosene stored at various points throughout the world. The Rockefeller Motor Company, supposedly formed by the oil people, has practically admitted that its primary purpose is to build an engine that will burn kerosene instead of gasoline. If this attempt proves successful, the automobile industry will be revolutionized and Standard Oil will receive general approval for having furnished a cheap fuel for the most popular means of transportation the world has yet discovered.

### MERCER SALES MANAGER.

**Almy Assumes Responsibility for Distribution of Trenton Product.**

Walter A. Almy has been appointed sales manager for the Mercer Automobile Company, Trenton, N. J., maker of Mercer cars. The appointment is one which will meet with general approval on the part of his many friends throughout the industry, and because of his past experience the officials of the company feel that he is a valuable addition to the Mercer organization.

Previous to his connection with the manufacturing end of the industry with this concern, Mr. Almy devoted several years to the retail sale of Cadillac cars in White Plains, N. Y., and later at Trenton, N. J. Naturally, this has had the effect of widening his acquaintance very materially and will be of decided value to him in his new position.

### DURYEA BUYS OUT BROOKS.

**Latter Concern Will Continue the Production of Boats and Furniture.**

The Duryea interests connected with the Duryea Motor Company, Saginaw, Mich. (Charles E. Duryea), have purchased of the Brooks Manufacturing Company of that city the business of its entire motor vehicle department. The Brooks concern will continue the production of boats and furniture. The purchase represents an investment of more than \$100,000.

The Duryea Motor Company has been engaged for some time in the manufacture of solid tire motor buggies, incorporating the Duryea system of cooling, roller drive and other exclusive features. The Brooks company produced light weight delivery wagons under license from

Charles E. Duryea, these incorporating many of the same features. Steps will be taken to establish both lines in separate factories, but under practically the same management.

### NATIONAL IN CHICAGO.

#### Tennant Motor, Ltd., to Handle Product for State of Illinois.

The National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, has closed a deal with Tennant Motor, Ltd., of Chicago, under the terms of which this concern becomes distributor for this line throughout practically the whole State of Illinois. The company is located at 2447 Michigan avenue, where it has

handled the Simplex line for some time. However, it has an option on a Michigan avenue corner property where it expects to build during the coming winter, so as to have larger quarters in which to take care of its spring business.

J. G. Tennant, treasurer of the concern, is the active controlling factor

**J. G. Tennant, Treasurer, Tennant Motor, Ltd.**

in the organization, particularly since W. G. Tennant retired to become vice president of the Stewart-Warner Speedometer Corporation. His ability as an automobile salesman has been such as to justify the prediction that the National business in Chicago and Illinois has been placed in safe hands. The concern will continue to represent the Simplex.

### CONCERNING ALCO TRUCKS.

#### Anticipated That New Company May Be Organized to Continue Production.

While nothing definite has been made public as yet, it is understood that a number of men in

Providence, R. I., some of whom were identified with the American Locomotive Company in the production of Alco trucks, are considering the advisability of organizing a new company to continue this line. It will be remembered that Aug. 13 the directors of the American Locomotive Company announced its complete withdrawal from the field of production, with respect both to pleasure and commercial cars.

William H. Draper and Michael W. Norton, both of Providence, have contracted with the American Locomotive Company for some 30 Alco trucks, the transaction involving an expenditure of about \$100,000, it is stated. It does not appear that Mr. Draper is interested in the proposition to organize a new company, but Mr. Norton is said to be actively engaged in studying the situation. When asked to make a statement concerning the matter, he expressed a desire to wait until about the first of the month.

### DEMISE OF G. W. BENNETT.

#### Vice President of Willys-Overland Company a Victim of Appendicitis.

The automobile industry, as well as a large portion of the business world in America, was shocked to learn of the sudden death of George W. Bennett, vice president and general manager of the Willys-Overland Company, in Toledo, O., Sept. 19, after an operation for appendicitis. His rare executive ability was a big factor in the success of the plants known as the John N. Willys holdings, and he was prominent throughout the industry because of his insight into the business methods making for permanency.

Mr. Bennett came to this country from England when a young man. At first he was identified with the bicycle industry as sales manager for the Thomas B. Jeffery Company, and went into the automobile field with this firm. Later he became associated with the Knox Automobile Company, Springfield, Mass., and the White Company, Cleveland, O. Soon after John N. Willys purchased the business now bearing his name in Toledo he became vice president of the Willys-Overland Company, and his duties grew with the expansion of that concern, Mr. Willys being the controlling factor in several other companies, among which may be mentioned the Gramm Motor Truck Company and the Garford Company. He was particularly well known in the East and Middle West and his advice was much sought after in all matters affecting the automobile industry.

**COLEMAN GAS PRODUCER.****New Company Would Transform Coal into Fuel for Automobile Use.**

The Coleman Gas Producer Company, capitalized at \$1,000,000, has secured a Delaware charter and proposes to place the Coleman gas producer on the market. The device is the invention of Clyde J. Coleman, and is said to be intended to take the place of the fuel tank of the present gasoline system on automobiles. Half of the space is to be occupied by the fuel reservoir, and the remainder by a special producer of special construction, operating, it is declared, on the principle of the "present stationary gas producer". Coal screenings, charcoal, crude oil or any other low cost carbonaceous material will be employed as fuel, it is explained.

Among those associated with Mr. Coleman in the enterprise are the following: President, H. H. Thomas of Thomas & Co., a Chicago stock and bond house; vice president, John Splitdorf; treasurer, P. J. W. Kelly; secretary, John Kane Mills, and Owen H. Fay of the O. H. Fay Auto Livery Company, Chicago. A stock issue of \$450,000 has been authorized, this having been placed on the market at \$10 a share.

**TORRINGTON COMPANY'S REPORT.****Annual Statement Shows Disposition of Splitdorf Concern's Holdings.**

The Torrington Company, Torrington, Conn., which is in a sense a holding company for the Excelsior Needle Company and the Standard Company of Torrington, the National Needle Company, Springfield, Mass., the Splitdorf Electrical Company, Newark, N. J., and other companies in this country and abroad, has made public its annual report for the fiscal year ending Aug. 31, 1913. In connection therewith President John F. Alvord makes a statement which will prove of interest to the automobile industry.

It will be remembered that the Torrington Company purchased the stock of C. F. Splitdorf, Inc., of New York City, something like a year ago, soon after which the latter concern was reorganized as the Splitdorf Electrical Company, and its headquarters removed to Newark, N. J. Concerning this movement, Mr. Alvord's statement is as follows:

The Splitdorf Electrical Company has been moved to Newark, N. J., with the exception of the spark plug business and the ball bearing business. The Standard Company has purchased the spark plug business of the Split-

dorf company, and the Excelsior Needle Company has purchased the ball bearing business. We are unable to make a report as to the earnings of the Splitdorf company, but feel very sure that we are making some profit and are getting the business into better shape. We believe that the Splitdorf company will eventually be one of our very profitable subsidiaries.

He states further that the business of the two needle companies mentioned has increased both in volume and profit, while the Standard Company has done increased business with largely increased profit. The annual report shows the following:

| <b>Receipts.</b>                 |                  |                    |                  |
|----------------------------------|------------------|--------------------|------------------|
|                                  | 1913             | 1912               | 1911             |
| Dividends .....                  | \$352,847        | \$360,285          | \$237,518        |
| Rent .....                       | 110,000          | 110,000            | 110,000          |

| Miscellaneous .....              | 32,152           | 24,922             | 4,848            |
| <b>Totals.....</b>               | <b>\$655,869</b> | <b>\$1,516,207</b> | <b>\$352,366</b> |
| <b>Expenditures.</b>             |                  |                    |                  |
|                                  | 1913             | 1912               | 1911             |
| Dividends and interest....       | \$400,000        | \$348,000          | \$288,000        |
| Salary and fees.....             | 31,855           | 31,397             | 5,947            |
| Bonds purchased.....             | 91,985           | 140,000            | .....            |
| Stock Splitdorf.....             | .....            | 750,000            | .....            |
| Loans subsidiary companies ..... | 100,000          | 101,525            | .....            |
| Miscellaneous .....              | 13,028           | 30,484             | 56,527           |
| <b>Totals.....</b>               | <b>\$636,868</b> | <b>\$1,401,406</b> | <b>\$350,474</b> |

The cash balance on hand Aug. 31, 1913, was \$285,740. The company has purchased during the year \$92,000 of its own bonds, which are held in the treasury of the company.

**HAZARD MOTOR PLANT.****Additions Will Enable the Company to Produce 5000 Engines a Year.**

At present the Hazard Motor Manufacturing Company, Rochester, N. Y., maker of Hazard power plants, is compelled to run several of its departments 20 hours a day in an effort to keep up with orders. To obviate this and to prepare for future expansion, the company is increasing its manufacturing facilities by the erection of a new building, 60 by 130 feet, and by the purchase of additional machine tools.

One part of the new building will be used for block testing, its area being double that of the present test room space. The balance of the structure will be used for stock and shipping rooms. The space in the present factory previously used for testing and storage of stock will be utilized for production purposes, increasing the same in both the assembly and machine departments over 30 per cent. It is anticipated that these various changes will enable the Hazard company to build a maximum number of 5000 motors a year.

### INCREASES CAPITAL STOCK.

#### Ray Harroun Company to Erect Its Own Kerosene Carburetor Factory.

The Ray Harroun Company, Indianapolis, Ind., maker of the Harroun kerosene carburetor, which is offered this year as optional equipment on Henderson cars, has filed a notice of increase in capital stock from \$50,000 to \$600,000, with the secretary of state in Indiana. The increase is needed, according to the statement of the company, in order that it may own its own plant.

It is announced that the company plans to erect a factory costing approximately \$200,000, although the exact site has not yet been determined. The present plant on 10th street, already has proven inadequate, orders for 200,000 kerosene carburetors having been received, according to officials of the concern.

The present stockholders include the following: Ray Harroun, well known as a racing driver; L. D. Woods, president of the Pension Mutual Life Insurance Company, Pittsburg; R. H. Allen, president of the Eastern Dispensing Company, Pittsburg; H. B. Wilcox, president of the W. W. Wilcox Company, Chicago, and D. M. Bell of the Ward-Bell Company, Chicago.

### GROUT PLANT SOLD.

#### Said to Be the First Erected in America for Automobile Production.

The plant of the Grout Automobile Company, Orange, Mass., claimed to include the first building erected in America to be devoted exclusively to the production of motor vehicles, was sold early in the month at receiver's sale. The company as such passes out of existence, but Arthur Kirkpatrick, for some years sales manager of the concern, purchased the stock of parts, chassis, etc., and one of the smaller buildings, which has been used as an automobile barn, or storehouse. Mr. Kirkpatrick announces that he is in a position to supply spare parts for Grout cars and will conduct a general repair business in this location.

The real estate, two large factory buildings with machinery, an adjoining shed and a two-story house, were purchased by the Orange National Bank, the price being \$19,010, to which must be added a mortgage and accrued interest amounting to \$3000. F. A. Dexter, president of the bank, states that the property will be sold to a new concern which desires a location in Orange

—not a motor car company. Nine motor cars, some new and some second hand, were sold to different individuals for which the receiver realized a total of \$3500.

### SEEK SOUTH AMERICAN TRADE.

#### Chicago Association of Commerce Opens Office in Buenos Aires.

Believing that American manufacturers have permitted business in South America to be taken up by European concerns largely because little effort has been made to establish the proper connections in Latin America, the Chicago Association of Commerce has opened what it terms a trade embassy in Buenos Aires, Argentina. This embassy, which is really a branch office of the Chicago organization, has opened a permanent exposition in which goods produced in Chicago are to be on exhibition.

F. C. Enright, who has been studying business and trade conditions in South America since 1909, has been appointed manager. Through personal association with retail merchants and wholesale distributors in several of the Latin American republics, Mr. Enright has succeeded in awakening an interest in American made goods. The exposition starts with exhibits from 50 Chicago factories, the line ranging from automobiles to tar soaps.

### NEW CAR FROM PENNSYLVANIA.

#### Standard Steel Car Company Experimenting at Its Plant in Butler.

The rumor that the Standard Steel Car Company, Butler, Penn., maker of railroad coaches, was about to engage in the automobile industry, has received what may be regarded as partial confirmation. Work has been progressing for some time on a new factory on a site of about 10 acres formerly used for a lead mill, and the company verifies the statement that these buildings are intended for automobile construction.

The work may be said to be in an experimental stage at present, and the officials of the company decline to make any further statement regarding their plans. It is pointed out, however, that in case of a favorable decision there is much machinery in the railroad car plant which could doubtless be used to advantage in the construction of automobiles.

## NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

**Boyce Motometer Junior.**

To obtain maximum efficiency from the motor the cooling water should not be allowed to boil, it being held that the best results are obtained when it attains a temperature of about 170 degrees Fahrenheit. When the motor overheats through a lack of water or oil, because of too rich a mixture, defective pump, etc., a loss of power follows and unless the trouble be remedied a large repair bill is likely to result. These conditions are not noted as a rule, until the car is stopped and an examination is made. The Motometer Company, Inc., 1790 Broadway, New York City, is marketing a Junior model of the Boyce Motometer, which is a neat, compact device for attachment to the radiator cap. It is fitted with a protected glass tube containing a red fluid which is actuated by the temperature of the water in the radiator. The dial of the Motometer is calibrated in degrees and lettered to denote the results obtained from varying temperatures, these including the maximum and minimum points, steaming and freezing, respectively. A small opening in the face of the dial permits of reading the device at night when the headlights are burning, as the red column is easily visible against the white back-

ticles of the material affect the efficiency of the flywheel generator. The Apco lining is of special construction; comes in lengths to fit the brake drum and rivets are supplied with each length.

**Radico.**

Radico is a chemical preparation for repairing leaks in the radiator, and it is claimed by the maker, the Radico Manufacturing Company, Springfield, Mass., that the compound contains no acids or injurious minerals which would eventually corrode the metal and cause other leaks. It is also stated that a damaged cooler can be repaired in 15 minutes. The compound comes in a compact can and can be easily stored in the tool box.

**A. V. Shock Absorber.**

The A. V. shock absorber, marketed by the Hudson Export & Import Company, 140 West 42nd street, New York City, is an imported design operating on the hydro-pneumatic principle. A hydraulic device is utilized for the purpose of putting a load on the springs in order to prevent any bouncing effect, but this load comes into operation when the spring is compressed, not on the recoil. There are two springs, one taking the normal load,

ground of the light. The Motometer is adapted to any type of radiator cap; comes finished in nickel or polished brass, and is moderately priced. Complete details of the device are set forth in a booklet which will be mailed on request.

**Apco Anti-Rattler No. 3.**

The Auto Parts Company, Providence, R. I., announces a new Apco device termed the Anti-Rattler No. 3. It is one of the most practical accessories for model T Ford cars brought out by this concern, as by it play in the ball end of the steering arm and connections is eliminated and it is possible to make adjustments from time to time as needed. It replaces the usual steel cap on both ends of the steering gear connecting rod, which, when adjusted by filing the halves of the ball socket, usually result in the part binding when the wheels are turned. This is due to the difference between the worn, flat and round part of the ball. The Apco device consists of a bronze shell adjusted by means of a screw plug in the base, and with it, it is possible to eliminate all play. The shell member also contains a spring which holds a steel stud in contact with the ball, resulting in a cushioning effect, and thus in easier steering. The new device is inexpensive. The company has also brought out a new brake lining for the service brake, a material in which all metal is eliminated. It is held by the Ford engineers that the use of a friction material containing any metal is largely responsible for magneto troubles, in that par-

the second, which is not as long, coming into operation when the load becomes greater. The hydraulic device consists of a centrally situated cylinder in which works a small piston connected to the crosshead. Smaller holes are bored at intervals through the walls of this cylinder and through these castor oil is forced on the down-stroke of the plunger. At the end of the down-stroke the level of the liquid rises above the top of the open ended cylinder, and the expansion of the springs, therefore, causes this oil to pass into the cylinder again, both through the small holes in the wall and also past the cup lever. The case containing the springs and forming the extension of the part upon which they rest at the base slides between the inner and outer tubes and thereby prevents any ingress of foreign elements to the working mechanism. An adjusting block is placed at the bottom, which allows the spring pad to be raised so as to place more pressure on the springs. The guides of the four slide bars are externally situated. A special form is made for use with the front springs, operating on the same principle, but the parts are arranged to replace the spring shackle in compression.

**Peerless Pump.**

The Peerless four-cylinder pump, produced by the Peerless Accessories Manufacturers, 1926 Wabash avenue, Chicago, is a small, compact unit, operated by a crank and designed to be clamped to the running board of the car. It requires but little effort to operate and it is

stated that a large sized tire can be inflated to the maximum pressure in a very short time. Each equipment includes a clamp, suitable length of hose and a gauge. The hose connection automatically opens and closes the valve in the tire. The pump comes finished in black enamel with nickel trimmings. It weighs nine pounds.

#### Stanley Mixer.

The Stanley mixer, manufactured by W. P. Deppe, 127 Duane street, New York City, is a mechanical device designed to be installed in the intake pipe between the carburetor and the cylinders. It comprises a series of spirals and flanges, the construction being rotated by the incoming mixture, an action resulting in breaking up any particles of fuel not atomized by the carburetor. This results in efficiency and economy in that the liquid is converted into a useful vapor and less gasoline is required. It is also stated that acceleration is greatly improved.

#### Stewart Patch Outfit.

One of the principal causes for failure of patches to adhere to the inner tube is a lack of pressure after applying. A handy addition to the tool kit or garage is the Stewart patch outfit, marketed by Chas. E. Miller, 97-103 Reade street, New York City. The equipment includes a lightning grip clamp, which exerts a powerful pressure over the entire patch. It is the size of an ordinary pair

types of devices fitted to the intake manifold of a motor in that it is controlled by the accelerator. It is claimed that by its use not only is the supply of fuel controlled, but a considerable saving is effected as well. It facilitates combustion in that complete vaporization of the gasoline is made possible. A plunger member, controlling the amount of air, is connected to the accelerator mechanism.

#### J-M Asbestos Yarn.

The H. W. Johns-Manville Company, New York City, is marketing the J-M asbestos yarn, which is wound especially for packing spark plugs, although it may be utilized for a number of other purposes and where a heat proof packing is required. It is a pure, two-ply yarn, each strand containing a fine brass wire, and the construction is unusually rugged. Its diameter is but .0625 inch and the yarn comes in spools, convenient for use. It is inexpensive.

#### A. A. S. Speedometer Light.

An inexpensive, yet high grade speedometer, clock or gauge light is being marketed by the American Auto Supply Company, 1741 Broadway, New York City, and 1410 South Michigan avenue, Chicago. It is small, neat and compact and comes complete for fitting to the dash. It is finished in brass or nickel and may be obtained with or without the bulb. A two candlepower lamp is utilized

of pliers and the entire outfit weighs but eight ounces. The clamp may be utilized for a hand vise and it is stated that it will retain securely anything up to 1.5 inches. To put on a patch it is not necessary to entirely remove the tube—just enough to get at the puncture, apply a patch and press it with the clamp. The outfit comes packed in a neat box.

#### Carbonox.

Carbonox is a chemical carbon remover manufactured by the Northwestern Chemical Company, Marietta, O., and it is stated that it does not dissolve the carbon, but attacks the charred oil that secures the flakes of carbon to each other and to the metal. By destroying this it is possible to blow out the deposits with the exhaust. To use, about half a pint is divided evenly among the cylinders by pouring it through the spark plug openings, and turning over the motor several times. It is allowed to stand for about 15 minutes, after which the engine is started. The solution comes in cans and it is stated that each contains enough material to keep a four-cylinder motor free from carbon for six months. A detachable spout is supplied with each container, and Carbonox may be injected into the cylinders much in the same manner as with an oil can, by exerting pressure on the bottom of the can.

#### Doxameter.

The Doxameter is manufactured by the Doxameter Company, Chicago, Ill., and differs from the conventional

with the device. The American Auto Supply Company is issuing a new catalogue, which will be mailed free on request.

#### Herbert Trouble Finding Switch.

The usual method of locating a missing cylinder is to short circuit the spark plug by either detaching the cable or utilizing a screw driver. Edgar Herbert, Broadway and 195th street, New York City, is manufacturing an ingenious switch which comes singly or in sets of four. It is a form of knife throw switch, the operating lever being insulated and employed to break the secondary circuit. Provision is made for attaching the secondary wire, a terminal being fitted to the part carrying the lever. The device is also designed to test the current from the source of supply as by engaging and disengaging the lever, the intensity of the spark may be noted. It could be employed to lock the ignition by leaving the lever disengaged when the car is left unattended. The Herbert switch is inexpensive.

#### Defiance Lock.

The Defiance lock is manufactured by the Defiance Manifold Lock Company, San Francisco, Cal., and as the name implies is a device for locking the intake pipe and preventing passage of the mixture to the cylinders. It is a controllable cut-off valve installed in the intake manifold and having a locking arrangement actuated by a removable key. It may be fitted to any make of car and is constructed in three sizes.

**Polo Pneumatic Tire Alarm.**

The importance of keeping the tires inflated to the proper pressure is well understood by the experienced motorist, but in the event of a small leak on the road the loss of air is not noticed until the car is stopped. The Polo Pneumatic Alarm Manufacturing Company, Clear Lake, S. D., is marketing a unique device termed the Polo pneumatic tire alarm, which comes in sets of four and is designed for attachment to the usual valve stem. When the pressure falls below a given point the alarm is sounded automatically, calling the attention of the driver to the shoe. The signal is said to be shrill and easily noted above the noises of the machine. The device is bored from solid brass, is very small and does not attract from the appearance of the car.

**Pierce Speed Controller.**

A form of governor, but differing from conventional practise in that it can be set for different speeds and locked, the owner retaining the key, is the Pierce speed controller, manufactured by the Pierce Speed Controller Company, Anderson, Ind. It is mounted between the carburetor and the intake manifold and regulates the supply of fuel by means of a butterfly valve. The last named component may be so set as to limit the vehicle speed as desired, a dial being incorporated for adjusting the mechanism and fitted with a lock. The device does

said to be sufficient for 50 gallons of gasoline, increasing the normal cost of the fuel about two cents a gallon.

**McNutt Safety Cap.**

The McNutt Can Company, 352 Pearl street, New York City, maker of non-explosive cans and tank devices for handling and storing explosive liquids, is manufacturing the McNutt safety cap, which is a device adapted to fuel tanks on motor cars. It is in the form of a screw cap and incorporated in it is a check valve, preventing vapors from leaving the container, but permitting ingress of air as required to break the vacuum where a gravity system is employed. This check valve prevents evaporation of the fuel, as well as eliminating danger of explosion through fire. The valve member has a fusible disc which gives vent to the internal pressure when the container is subjected to fire, thereby preventing an explosion. It is stated that considerable economy is made possible through the use of the device, which is moderately priced.

**Shaler Electric Vulcanizer.**

The C. A. Shaler Company, Waupun, Wis., is marketing a portable type of electric vulcanizer designed for service in the private or public garage, which may be operated on the lighting current, the outfit being constructed for direct or alternating currents and of different voltages. Plates are included for casings and tubes and a large variety of work may be performed with the

not affect the speed of the engine until the set speed is exceeded. All parts are enclosed, so as to be dust, water and tamper proof. The price varies according to the finish.

**O'Brien Limousine Telephone.**

The Joseph F. O'Brien Manufacturing Company, 61 Park Place, New York City, is marketing a new limousine telephone which differs from usual construction in that a reply can be received from the chauffeur. The design of the receiver employed by the driver is made so as to be loud speaking in order that instructions may be heard in noisy traffic. The inside instrument comprises a receiver and transmitter in a unit, and a button is also incorporated for signalling the chauffeur. The system may be operated by dry cells or a storage battery and the instruments are very neat and compact, that utilized by the passenger being fitted with suitable length of flexible cord, retainer, etc.

**Inter-Lube.**

The Inter-Lube Chemical Company, 915 Schofield building, Cleveland, O., is marketing a liquid preparation called Inter-Lube, which is mixed with the gasoline in the proportions of one teacupful to five gallons of fuel. It is stated that it will mix freely with the fuel without stirring, and is free from injurious chemicals and sediment. Several claims are made for the compound, among which are: Increase of mileage, more power, less lubricant required, no carbon and easier starting. A can is

equipment. The temperature is regulated by a rheostat, making the vulcanizer adaptable to all kinds of repairs, and the regulating device can be located away from the work bench, where it cannot be injured through accident. The company manufactures a wide variety of vulcanizing outfits and issues a booklet on the work, which will be mailed on request.

**Fogg Horn.**

The Motor Specialties Company, Cooper Lane, Waltham, Mass., is manufacturing a special exhaust operated horn designed especially for model T Ford cars, although it may be fitted to other types. It is a compact, well designed signalling device, simple in construction and being installed between the motor and the muffler its efficiency is not impaired by a leaky muffler. The signal proper is so arranged that the sound is thrown forward, insuring a volume of tone, even with the motor operating slowly. There are few moving parts, and no opportunity for back pressure or for clogging. It can be so installed that it does not interfere with the use of the usual cut-out.

**Prest-o-Ceal.**

Prest-o-Ceal is the product of the American Manufacturing & Distributing Company, Louisville, Ky., and is a thin paste holding in suspension the exact proportions of mineral solids and a fibre that will harden quickly. Enough of the liquid is injected into the inner tube to form a thin layer, and the material is spread evenly by the motion of the wheel.

# WORLD'S RECORD FOR COOPER'S STUTZ.

WITH a new world's class record of 75.03 miles an hour to his credit, Earl Cooper won the 251.97-mile road race at Corona, Cal., Sept. 9, and then continued to the end of the 300-mile free-for-all event to finish a winner the second time the same day. Of course, he drove a Stutz, and these two victories made a total of five long distance events taken by this combination on the Pacific Coast this summer. The others were as follows: July 5, Potlach trophy, Tacoma, Wash., 220 miles; July 7, Montamarathon

Earl Cooper in a Stutz, Finishing a Winner in Free-for-All Event at Corona, Cal.

trophy, Tacoma, Wash., 250 miles; Aug. 9, road race, Santa Monica, Cal., 445 miles.

There is little satisfaction in considering what might have been, but it may be stated that the keen rivalry which has existed between the Stutz and Mercer drivers since the opening of the present racing season resulted in one of the most spirited contests of the year over the Corona course. Barney Oldfield was selected as the member of

the Mercer team to do battle against Earl Cooper and the Stutz. Oldfield has a record of past performances enjoyed by but few drivers in the world, but Cooper with his three previous big victories was a contestant worthy of the best that could be produced. Incidentally, it may be remarked that in the history of automobile racing there has been no driver to equal the performance of Cooper in taking three of the biggest, long distance, road races of the year. And Cooper was practically unknown a year ago.

But to return to the battle between Oldfield and the Mercer on the one hand and Cooper and the Stutz on the other. Oldfield took the lead on the first round and held it until the 14th, when he dropped one point. Thereafter he fluctuated between first, second and third until the 46th lap, when he seemed a certain winner. The Mercer lost its opportunity for winning the race in the 59th lap, when a nine-year-old lad, having wandered away from his mother's side in the excitement of the race, ran onto the course directly in front of the leader. Oldfield's pace at this point was estimated at close to 78 miles an hour. With that clear headed generalship for which Barney Oldfield long has been known, the steering wheel of the Mercer was turned abruptly. A front wheel was crumbled under the car and the mechanic was thrown against the curb. The driver and the boy were wholly unharmed. It is useless to speculate upon what might have been, but the boy's life was saved and at a splendid sacrifice.

There were three races on the card at the Corona meet. The first was for light cars, of 230

Start of the Heavy Car and Free-for-All Events in the Road Race at Corona, Cal.

cubic inches piston displacement and under, the distance being 102.45 miles. The starters were as follows: Frank B. Goode, Studebaker; Edward Waterman, Buick; Rev. Earle Schnack, Ford; Earle Jackson, Reo; Harry Rhodes, Studebaker; Pratt, Ford; Rascher, Ford; Caldwell, Maxwell; Crawford, Maxwell; Troebbe, Studebaker.

Upon the face of the returns, Waterman returned a victor in the Buick, his time being 1:37:26. Jackson in a Reo was second in 1:41:06.4; Goode in a Studebaker, third in 1:46:00, and Schnack in a Ford, fourth, in 1:57:22. There was a possibility that this standing might be changed as the result of a protest, since on the next to the last lap Waterman passed the pits, and when just over the line threw his motor into reverse to back up to them. Referee Mitchell saw the move and immediately forced the Buick around the course. The time at the finish gave the Buick a new world's road racing record for the class of 63 miles an hour.

The two big races were run together. That for 251.97 miles was for heavy cars, 231 to 450 cubic inches piston displacement, and it was in this event that Cooper made his world's class record. The starters were: Barney Oldfield, Mercer; Felix Magone, Stutz; Tony Jeanette, National; Ralph De Palma, Mercer; Spencer E. Wishart, Mercer; Earl Cooper, Stutz; Wilson, Marion; C. H. Taylor, Marmon; Joseph Mansfield, Macomber; P. E. Leach, Macomber.

The two Macomber cars were entered by Willis George Emerson. They were each fitted

with the new Macomber rotary valve motor, and for this reason there was considerable interest in their performance. Both got away well, Mansfield's car making an average of nearly 66 miles an hour during the early rounds of the course. Leach's machine reached a speed of 75 miles an hour at one time, but shortly afterward was forced to withdraw on account of engine trouble. On the fourth lap Leach challenged Oldfield to a brush, in which the rotary valve engine appeared to be capable of holding its own, at least for

short distance spurts. Mansfield's car stayed in the race for 37 laps.

The heavy car race was won by Cooper in the Stutz, his time being 3:21:29.2. C. H. Taylor in a Marmon was second in 4:09:33, and Tony Jeanette in a National was flagged in third position. Cooper was the only one of the three to continue in the free-for-all, in which three Fiat cars, driven by George Hill, Frank Verbeck and Teddy Tetzlaff, also competed. Cooper's winning time in this event was 4:02:38. Verbeck was second in 4:10:20, and Hill was flagged in third position. Tetzlaff was forced out just before the free-for-all really began.

The positions of the leaders in all three races, at important points, are given in an accompanying table, as well as the points at which the various cars went out of the running. The course was approximately three miles in length. Tire trouble was frequent, due largely to the extreme heat and the fast pace set up by the leaders.

Cars Lined Up at the Start of the Light Car Race in the Recent Corona Meet.

## REO ADDS ELECTRIC LIGHTS AND STARTER.

**A** FULL equipment, including electric lighting and motor starting, newly designed bodies and a reduction in the selling price are

the top, which is a high grade mohair. The lighting and motor starting system is a unit and the former includes a dimming device whereby

the headlights may be utilized in sections where the ordinances prohibit the use of searchlights and when passing teams in the country, etc. The tire carrier is fitted at the rear and the new design includes a bracket for the tail light and license plate. The indicating instruments are neatly mounted, the speedometer, lighting switch, etc., being set flush with the polished surface of the instrument board. The reduction in price and the addition of equipment has been made possible by the production of

one chassis and the standardization of parts.

For the benefit of those not familiar with the mechanical details of the Reo the Fifth, it is stated that the motor is a four-cylinder of the L head type, with the cylinders cast in pairs and having a bore of four inches and a stroke of 4.5. Although rated at 30-35 horsepower, it is stated to have developed considerable in excess of the amount which is conservative when the piston displacement of 226.2 cubic inches is considered. The crankshaft bearings are three in number and these and other interior components of the power plant are very accessible from the outside.

Cooling is by a gear driven pump, the water jackets being very liberal in size, and the exhaust valves are directly in the path of the incoming fluid. The radiator has sufficient capacity to

**Reo the Fifth Five-Passenger Touring Car, Which Comes Completely Equipped, Including Electric Lighting and Motor Starting.**

among the features of the new fall series of the Reo the Fifth, made by the Reo Motor Car Company of Lansing, Mich., for which R. M. Owen & Co., New York City, is general distributor. The one chassis will be continued with the same mechanical features in the main, the efficiency and durability of the model having been amply demonstrated in service during the past season. A number of minor changes have been incorporated, these including an improvement to the transmission making for quietness and efficiency. Two bodies will be fitted, a five-passenger touring and a two-passenger roadster, and both are suspended lower than formerly. They have a neat cowl dash and a gondola back, which provides additional room in the tonneau of the touring model. The body of the roadster is particularly well designed and the compartment at the rear is sufficiently large to accommodate tools, baggage, etc. The upholstery and finish are first class in every respect and the interior is as attractive as the exterior.

That the purchaser will receive considerably more value for less money is noted in the equipment. Formerly the top, rain vision windshield and speedometer were listed extra. This year they are included as standard with an electric horn, extra demountable rim, full equipment of tools, etc. Side curtains and a slip cover come with

**Reo the Fifth Roadster, Having Newly Designed Body and the Same Accessories as the Touring Model.**

meet the requirements of the severest kind of service. The usual adjustable fan is provided. Lubrication is a combination splash and pressure system, a pump maintaining the proper level of oil at all times.

The clutch is a multiple disc and includes an automatic device, preventing dragging of the plates. The transmission is of the selective type, providing the conventional three forward speeds and a reverse, and the gear change lever is located at the centre and is fitted with a "cane" handle. The last named has a very short throw and easy changing of gears is a feature of the design.

Drive is by shaft to a bevel gear semi-floating rear axle, which is sturdily constructed, as formerly. Roller bearings are utilized throughout. The wheelbase is 112 inches; tread standard, 56 inches. The tire dimensions are 34 by four inches, and quick detachable, quick demountable rims with one extra member are fitted.

The driver is placed at the left with control lever at centre. The pedal control of the Reo differs from conventional practise in that the clutch also actuates the service brake, while the emergency is operated by another pedal. This permits the driver to employ both hands for steering. Instead of rods and linkage, the brakes are actuated by ample sized cables, making for quiet operation. Both sets are easily adjusted.

### STEWART HUB ODOMETER.

#### New Mileage Recording Device Particularly Adaptable to Commercial Car Service.

The value of checking the performance of the mechanical transport in service is conceded to be important by those who desire to determine the exact cost of the delivery system. Given the mileage, the cost a ton-mile, etc., may be obtained, and with the electric vehicle it is possible to note the mileage a charge of the batteries.

The Stewart-Warner Speedometer Corporation, Chicago, is manufacturing a new hub odometer which is designed particularly for com-

mercial vehicle service, but adapted to any make of electric or gasoline car. The device is very compact, as will be noted by the accompanying illustration. It is attached to the hub of the machine, being enclosed in a cylindrical casing, and is provided with a flat dial with the numbers showing in a slight recess.

The odometer registers 100,000 miles for the season, the numerals being black on a white background and their size such that they are read easily. The instrument also shows fractions of a mile in tenths. The drive is positive through steel pinions of the spiral type, and each of these is machined from a solid piece of high grade steel, carefully heat treated and hardened to resist wear.

Through an ingenious application of the "Geneva Stop" mechanism the dials are locked, ex-

New Stewart Hub Odometer Having Positive Gear Drive and 100,000-Mile Season Register, Also Fractions.

cepting at the instant of registering, and those not moving remain locked, a construction making for accuracy. The maker states that the odometer is springless, and that there are no pawls, ratchets, etc., in the mechanism. The new instrument is known as the model H.

The latest number of *The Goodrich*, the monthly house organ of the B. F. Goodrich Company, Akron, O., contains much of interest to both dealer and owner. The booklet is well illustrated and the text matter is prepared in a manner to indicate the varied service in which Goodrich tires are performing satisfactorily. An article of more than usual interest to the owner is that dealing with the winning of the Glidden tour by the Metz team, shod with Goodrich tires.

## KEMCO GENERATOR REPLACES THE FAN.

**A**N INGENIOUS and practical application of a dynamo for generating electricity for the automobile not equipped with a lighting system

Fig. 1—Kemco Fan Generator Installed.

has been brought out by the Kouyoumjian Electric & Manufacturing Company, Cleveland, O. It is designed especially for used machines and where the installation of a conventional generator would involve considerable alterations, as well as expense. The simplicity of the design and the ease of fitting will be seen by an accompanying illustration, Fig. 1, which shows the generator installed on a standard type of car. The Kemco generator is cylindrical in form; is mounted on the fan bracket, and, replacing as it does the original fan, virtually does not require additional space for installation or special fittings. The compactness of the design is indicated at Fig. 3, which shows two types of fan pulleys, a V and a flat member. Any standard belt may be utilized. The method of conducting the current generated is also outlined, it also being possible to bring out the leads from the side of the spindle as shown by the dotted lines.

Drive is by the regular fan belt, the maker of the Kemco generator supplying with the dynamo a pulley which will provide the proper ratio between the driving and driven members, which are proportioned to meet the requirements of the motor; that is, the crankshaft or camshaft speed of the engine. By this arrangement it is a simple matter to enlarge or decrease the diameter of the generator pulley to obtain the desired output of current and to change the charging rate. This construction permits of using the generator on another car, the only change necessary being that of fitting a new pulley. In the event of a change it would not necessarily involve the fitting of a new pulley to the generator as a new driving member could be utilized.

The Kemco generator differs from conventional construction in that the field is fixed in the centre, the armature revolving outside it, whereas in usual practise the armature rotates within the field. The design has many advantages, among which are mentioned dissipation of the heat and more certain retention of the windings. The latter feature is obtained because centrifugal force tends to force the winding in and not out of the slots. The brushes utilized are of the standard round type carbon, the maker stating that one set will operate 50,000 miles without replacement, and that an electric light carbon could be employed if necessary.

While it would appear to those not familiar with the principles involved in cooling by air currents that in utilizing that space occupied by the fan hub for the generator, the fan efficiency would be reduced, this does not obtain in practise, as it is well known by engineers that the inner end of a fan blade is of very little use. Tests conducted by the maker of the Kemco device are said to have demonstrated that it improved the efficiency of the fan in that energy is not expended in drawing air in a reverse direction through the fan centre. The light weight of the generator and the use of high grade bearings are factors making for a minimum consumption of motor energy. Another important feature is that the operation of the dynamo is noiseless. The enclosure of the

Fig. 2—Tests of Kemco Fan Generator Showing Ampere Output at Constant Voltage of Six Volts and Varying Speeds.

generator is such that it is stated that it is impossible for water, oil or dust to find its way into the dynamo.

The complete system includes, in addition to the generator, a small, compact ammeter for mounting on the dash; a cut-out, a switch and a distributor.

Fig. 2—Dimensions of Generator.

battery when the dynamo develops a proper charging rate, and to cut it out when the output is such that the battery would discharge through the generator. In the Kemco system the cut-out or control member is incorporated with the ammeter. The latter not only indicates the output of the generator, but any slipping of the belt is also detected. The usual provision for adjustment of the belt is included.

The maker of the Kemco generator states that its charging characteristics are such as to maintain the battery in a properly charged condition and that the cells are protected against heating from overcharging. The generator begins to charge at a high rate at low speeds and the output decreases at high ratios. This makes for efficiency in that the car may be operated around town as well as utilized in touring. The battery may be employed in connection with any type of motor starter having a good efficiency and torque. The generator begins to charge the battery at 400 revolutions a minute and the output in amperes of three types of Kemco dynamos is shown in the chart at Fig. 2. The output above a predetermined amount is electrically controlled.

The wiring plan shown at Fig. 4 is simple—two leads from the dynamo connecting with the base of the combined cut-out and ammeter, thence to the battery, which is a six-volt unit. All current utilized for the lamps, etc., is drawn from

the battery as previously pointed out, a distributor providing connections for the various wires to the lamps, and control of the last named members is by the usual multiple switch. Duplex wire is utilized and as the leads are thoroughly protected, no trouble should be experienced in the nature of leakage due to short circuits. The simplicity of the system and the ease of installation should appeal to motorists wishing to install a lighting system without alteration of the power plant and where space does not permit of the use of a conventional design.

### MAXWELL IN SOUTH AFRICA.

#### William Campbell of Johannesburg Takes Agency After Visiting the Factory.

William Campbell of Johannesburg, South Africa, was a recent guest at the factory of the Maxwell Motor Company, Detroit, as a result of which he has signed a contract to represent the company in that country. He is a man of long experience with large organizations in South Africa, and is vice president of the British Manufacturers' Representatives' Association, as well as as a member of the Johannesburg chamber of commerce. Concerning the situation in his country he has the following to say:

The country is in the infancy of its development. That development is working in right lines and the future is very promising. Producing at present nearly \$200,000,000 in gold, over \$45,000,000 in diamonds and more than \$13,000,000 in ostrich feathers, it has turned its atten-

Fig. 4—Wiring Plan Is Simple, the Battery Being Floated on the Line and Current Supplied to Light Through a Distributor.

tion seriously to the vast agricultural possibilities. These conditions make for wealth and the American car, being especially adapted to the needs and roads of the country, should have a splendid future there.

## WITH THE MOTORING INTERESTS ABROAD.

### Many American Manufacturers Will Make Display at Paris Salon---Vauxhall Secures New World's Records---Gray & Davis Invades England---Foreign News Notes.

**A**MERICA appears to be taking a decidedly greater interest than ever before in the Paris Automobile Salon, which will be held in the Grand Palais, Oct. 17-27. It will be noted, as well, that the date is much earlier than usual, the show having been held in December in former years, and generally for practically a full month. This action on the part of American manufacturers is not surprising in view of the situation with respect to the market for these products in France and other sections of Continental Europe, for which the Paris Salon is the accepted meeting place.

In the drawing for space the Hudson Motor Car Company, Detroit, secured stand No. 1, directly opposite the main entrance and easily the most desirable in the hall from many viewpoints.

**Eighteen Horsepower Wolseley Car of British Make Finds Poor Road Conditions in South Africa.**

Applications for space have been received from 635 firms, which is the largest number ever received, exceeding that for the 1912 display by five.

Besides the Hudson maker, the following producers of cars will show direct: Buick Motor Company, Flint, Mich.; Cadillac Motor Car Company, Detroit; Ford Motor Company, Detroit; Hupp Motor Car Company, Detroit; Mitchell-Lewis Motor Company, Racine, Wis.; Willys-Overland Company, Toledo, O.; Packard Motor Car Company, Detroit; Studebaker Corporation, Detroit; Thomas B. Jeffery & Co., Kenosha, Wis., and J. I. Case Threshing Machine Company, Racine, Wis. Makers of accessories and supplies will display direct as follows: Stewart-

Warner Speedometer Corporation, Chicago; Vacuum Oil Company, Rochester, N. Y.; Lovell & McConnell Manufacturing Company, Newark, N. J., and International Acheson Graphite Company, Niagara Falls, N. Y. Other concerns will be represented through their Paris agencies.

#### NEW WORLD'S RECORDS.

##### Vauxhall Exceeds Long Distance Marks Held by Single-Sleeve Argyll.

A. J. Hancock, driving a 25 horsepower Vauxhall of the so-called Prince Henry type, secured new world's records from 300 to 700 miles, and for four, five, six, seven, eight and nine hours, on the Brooklands track, Weybridge, England, early in the month. While some of these were previously held by the 15-30 horsepower Argyll, with single-sleeve valve motor, the latter car still holds the marks for 800, 900 and 1000 miles. Hancock went out to take all records to 1000 miles, but met with an accident at the end of nine hours. The new and old marks are presented in comparative form in the accompanying tables:

| Miles | Former Holder | Old Record | New Record |
|-------|---------------|------------|------------|
| 300   | Thames        | 3:30:17.54 | 3:15:24.72 |
| 400   | Dietrich      | 4:34:23.87 | 4:21:14.99 |
| 500   | Dietrich      | 5:48:38.87 | 5:34:10.34 |
| 600   | Argyll        | 7:40:49.63 | 6:46:57.27 |
| 700   | Argyll        | 9:06:53.76 | 7:58:42.74 |
| Hours | Name          | M.P.H.     | M.P.H.     |
| 4     | Dietrich      | 86.19      | 91.64      |
| 5     | Dietrich      | 84.59      | 91.30      |
| 6     | Dietrich      | 86.36      | 90.18      |
| 7     | Argyll        | 77.81      | 88.60      |
| 8     | Argyll        | 77.79      | 87.76      |
| 9     | Argyll        | 76.74      | 83.31      |

#### ENTERS BRITISH FIELD.

##### Gray & Davis Electric Lighting and Starting System Goes Abroad.

According to the Autocar, a British motoring print, Gray & Davis, Inc., Boston, Mass., is soon to place its electric lighting and starting system in that market. This action is of exceptional interest, because of the well known lack of such equipment on cars sold in Great Britain. It may also be taken as an indication of the results to be obtained by American manufacturers from the recent visit of members of the Institution of Au-

tomobile Engineers to this country.

The foreign method of sale, in which the manufacturer produces the chassis only, the purchaser having the body and equipment supplied to his specifications, brings about very different results from those obtaining in America. Several of the British engineers expressed themselves, while in this country, as convinced that the motoring public at home would very shortly come to realize the value of motor starters, and that another year would see them much more generally used. Thus far, very few British manufacturers have turned their attention to this subject, but it will prove of interest to note the success attending the introduction of the Gray & Davis equipment abroad, and its effect upon the display of cars at the forthcoming Olympia show.

#### NEWS NOTES FROM FOREIGN LANDS.

The Automobile Club of Moscow, Russia, is planning a race, starting and ending at Moscow and visiting Orel and Kharkoff.

Owing to the lack of support from the trade, the idea of holding a motor show at Sydney, New South Wales, has been abandoned for this year.

The next Belgian automobile show will be held at Brussels, Jan. 10-21. Applications for space closed Sept. 15 and the drawing will be held Oct. 4.

Denmark has agreed to join the International Automobile Convention with regard to touring motorists and the use of the international pass, as from May 1, 1914.

In order to adapt the roads of France to motor tourist traffic, the government proposes to spend \$50,000,000 during the next 10 or 12 years on tarring about 6000 miles of highway.

The rules and regulations for the 1914 Targa Florio race, which will take place in Sicily, May 24-25, provide that the event will be open to all cars with a maximum engine capacity of nine litres (549 cubic inches).

Col. Magrath, the veteran Irish motorist, has died at his home in County Wexford, at the advanced age of 86. Col. Magrath was among the first men in the British Isles to own and operate a car, and as such was held in high esteem by all British motorists.

Australia is the latest country to join the automobile industry, an engineering firm in that commonwealth now being engaged on the first model of a car designed and constructed entirely by Australians, and with but a few exceptions wholly of Australian materials.

Twenty-four cars were entered for the Coupe de L'Auto race over the Boulogne circuit in France, Sept. 21, as follows: Peugeot, three; Delage, two; Koechlin, four; Th. Schneider, three; Zenia, two; Sunbeam, three; Alda, two; Anasagasti, one; Vauxhall, two; Buick, two.

The fifth race for the O'Gorman trophy will be held on the Brooklands track, Weybridge, England, Sept. 27. The conditions specify that the car shall be propelled by means of an internal combustion engine, but option is allowed as to the kind of fuel employed, as well as auxiliaries, such as compressed oxygen, acetylene, etc.

According to the official report concerning the value of cars imported into France during the six months ending June 30, 1913, there was an increase of nearly 65 per cent. over that for the corresponding period in 1912, or as \$1,335,000 to \$2,172,000. Great Britain occupies first place in value of importations into that country, and the United States second.

An evidence of the increasing interest in motoring in India is found in the recent publication of a special au-

tomobile issue of the Statesman of Calcutta. The number consisted of 40 pages, 18 of which were devoted to motoring subjects and announcements concerning the many large firms engaged in the automobile industry in India.

New motoring regulations went into effect in Spain, Sept. 1. After that date all cars in the country, with the exception of those owned by foreign tourists, must be registered and carry an identification plate at both front and rear, with letters and numbers in black on a white background. A system of licenses for drivers also has been instituted.

That motoring has secured an important foothold in Ireland, since the expenditure of road funds by the British Road Board, is borne out by the fact that the Royal Irish constabulary has established a number of speed traps and three motorists were fined for speeding in one day recently by the Kingstown police court. The first defendant was accused of travelling at 28.5 miles an hour.

The prefect of police in Paris, acting in conjunction with the chief inspector of mines, has issued an order, in which it is recognized that operators engaged in testing machines on the road must necessarily exceed the legal speed limit of 18.75 miles an hour at times. No prosecutions for such offenses will be made, providing they occur after 7 in the morning from April 1 to Sept. 30, and after 8:30 in the morning from Oct. 1 to March 31.

#### REPORTS CONDITIONS GOOD.

##### Maxwell Sales Manager Returns from Eight Weeks' Trip About the Country.

C. F. Redden, sales manager of the Maxwell Motor Company, Detroit, has returned to the factory after an eight weeks' trip about the country, during which he visited all the distributing branches of the company and travelled some 25,000 miles. In each of the large centres district meetings were held, at which Mr. Redden had opportunity to talk with the dealers throughout each particular section—some 1500 all told.

As a result of this trip and the intimate association with the men in the field, he says that if all companies enjoy at least one-half the success now assured to the Maxwell concern, 1914 will prove a banner year for the industry. He adds that although the company is now making daily shipments of each of its three models, it has been impossible to keep up with the demand. However, increased facilities and organization are expected to remedy this condition in the very near future.

Under the auspices of the Chicago, Black Hills & Yellowstone Park Highway Association, a party in a Studebaker car has just laid out a more direct motoring route to this national reserve from Chicago. The way leads through Madison, Racine, Mankato, Pierre, Rapid City, the Black Hills and Cody, Wyo. It is said to be both shorter and better than the former route by way of Denver.

## MECHANICAL NOTES FOR OWNERS.

### Inexpensive Device for Steering Column Control of Air to Carburetor---Cleaning and Adjusting Ball Bearings---Heating the Carburetor---Suggestions from Readers.

**O**BTAINING the proper proportion of fuel to air to secure maximum efficiency from the motor requires some experience in the adjustment of the carburetor. With the modern type having two jets and an auxiliary air to set, the work is simplified to a certain extent in that the carburetor may be adjusted for low and high speeds, and independently. With certain types, however, it is difficult to obtain what may be termed an all around mixture; that is, one that will be rich enough to permit of easy starting of the engine in cool weather and yet not be too rich when the car is travelling at 20 to 35 miles an hour.

In the majority of instances where trouble of this nature is experienced, it may be said to be due largely to the condition of the motor. When the engine is new it is a simple matter to set a carburetor and to obtain satisfactory results, as

Steering Column Control of Supplementary Air Supplied to the Intake Pipe, a Device Facilitating Carburetion.

far as both efficiency and economy are concerned. But when the valve guides begin to wear, admitting auxiliary air, and extra atmosphere finds its way through poorly fitted gaskets, etc., trouble is experienced.

Of course the most satisfactory method is to eliminate all superfluous air, but this is not always easily accomplished with some types of motors, especially those in which the valve guides are cast integral with the cylinders. Under such conditions the cylinders must be displaced, guides bored and new valve stems fitted. Sometimes it is possible to cut a thread and fit a stuffing box as outlined in the issue for Aug. 25.

An ingenious method of overcoming carburetion trouble was noted by the writer recently. The owner had not experienced any great difficulty in adjusting the carburetor, but found he

was obliged to change the mixture for starting and operating; that is, more fuel was necessary for starting, after which it had to be cut down. The carburetor was not fitted with an auxiliary air intake, the design being supposed to supply air in proportion to the fuel at all motor speeds.

The installation of the device is shown in an accompanying illustration which is practically self-explanatory. As will be noted, it comprises a pipe tapped into the intake pipe above the carburetor and extending through the dash, and fitted to the steering column. At the top of the pipe is fitted an ordinary petcock. The latter is kept closed until the motor has warmed up and then gradually opened until the best operating results are obtained.

The object of the device is to admit auxiliary air into the intake pipe, supplying additional atmosphere as required, and it also serves to break up and convert into vapor any particles of fuel not atomized by the carburetor. The owner states that since its installation he has increased the mileage a gallon of fuel to a considerable extent, and that more power is secured than formerly.

The cost of the stock is slight, it comprising a suitable length of .125 inch pipe, four elbows and a petcock. The material can be secured at any plumber's or supply house, and cut and threaded to dimensions. The installation might necessitate the removal of the intake pipe, but in the case mentioned the induction member was made in two sections, facilitating the work. The hole in the intake pipe could be drilled and tapped without displacing if sufficient care were exercised in the work, but the carburetor would have to be removed to prevent the chips of metal falling into it.

### ADJUSTING BALL BEARINGS.

With the growing tendency to utilize ball bearings in the motor car the owner should have at least a working knowledge of how to clean and adjust these members. The following suggestions of the New Departure Manufacturing Company, Bristol, Conn., maker of ball bearings, will be of service to the owner in the care and maintenance of his car.

A ball bearing must have a certain amount of running clearance, being less than with plain bearings, and

it is common practise to allow a radial freedom never greater than .001 inch. In connection with this, in single radial bearings an axial freedom or end play of the inner race relative to the outer is allowed, this varying with

Shimming Ball Bearings.

the size of the bearing between the extremes of .0005 to .005 inch for new bearings. Thus a properly made and installed bearing will not deteriorate; that is, there will be no reduction in diameter or increase in bore. If there is an excessive amount of radial or axial motion, it is invariably caused by the admittance of some abrasive between the parts or by overload. The amount of wear will depend upon the cutting power of the grit, the pressure and the length of time the foreign matter is between the surfaces.

Many bearing troubles have been traced to the presence of dirt and metallic particles in the rear axle, transmission, etc. Many causes of failure are also due to rust created by the indiscriminate application of a stream of water at 40 to 50 pounds pressure a square inch to the parts of the car in which the bearings are mounted. That rust is absolutely destructive to ball bearings has been proven and the effect of rust is easily pointed out when it is considered that the finish of the balls is to .0001 inch and the deposits of rust establish a greater thickness. The results of rust are noted easily by even the novice, being indicated after cleaning by pits or depressions. While these minute irregularities are sometimes caused by overloading and the flaking off of the metal, which results from this condition, if due to causes other than rust and acid, the roughness would be confined to the ball tracks, whereas excoriations resulting from chemical action will be in evidence on all parts of the bearing.

A good lubricant for bearings is a slush made of pure vaseline and lighter mineral oil, this being heated to make its viscosity less and enable it to penetrate all parts of the bearings. When the bearing has been dipped in this and allowed to remain long enough to permit the oil to reach all parts, it is taken out and allowed to cool, and the surplus lubricant wiped off the outside. Such a mixture will stay in place and will not run out like lighter oils, and at the same time its viscosity is not so high that it will produce unnecessary friction.

Bearings should not be cleaned in dirty gasoline in which other parts have been washed. A simple solution of common washing soda and hot water is easily made by using about a handful of soda to a pail of boiling water. The fluid should be kept hot while it is being used. The bearings should be dipped in the fluid to remove all dirt, then immersed in clean kerosene and thoroughly washed. It will take but a few minutes to accomplish both operations, after which the bearings should be inspected.

In adjusting New Departure or other cup and cone type bearings care should be taken not to have them too tight or too loose. The condition of the bearings may be ascertained by jacking up the wheel, then grasping the wheel rim at opposite points and shaking the wheel. Any looseness in the bearings can be detected by the lost motion between the wheel hub and spindle. (Play in the spindle pin or bolt should not be confounded with that in the bearings, and if the bolt is worn it is best to chock the spindle with a piece of wood.)

In taking up lost motion considerable judgment must be exercised in screwing up on the adjusting member, not to get this too tight and impose an injurious end pressure of the balls. An excess pressure that will stress the bearing parts dangerously will not make much difference in the wheel resistance when turned by hand, though when the car weight must be sustained at high

speeds or when going around corners, the resistance will be increased materially and bearing endurance reduced in proportion.

A safe rule to follow is to take up the wear by screwing in the adjustment nut so that the shake or looseness will be eliminated, yet permit the wheel to spin for a few revolutions when given an initial impulse. Many motorists and even inexperienced mechanics commit the error of adjusting bearings of the take-up type too loosely. This is not desirable, any more than fitting parts too loosely together is. Always lock adjustment nut firmly in place when proper adjustment has been secured.

In some gear boxes and axles the bearings are shim adjusted. A number of thin washers of sheet brass may be interposed between the bearing cup and the retainer cap, as shown in an accompanying illustration. When taking down an assembly of this nature always keep the shims from any bearing box together and tagged for future identification to insure that the adjustment made in the factory will be maintained in the reassembly. If the bearings are loose for any reason, add thin shims about .005 inch thick to the others, until there is no appreciable lost motion and yet no binding between bearing parts.

### HEATING THE FUEL.

It is noticeable that the modern motor comes equipped with means for heating the fuel, the object being to increase its volatility, which is essential in cool weather owing to the density of the gasoline. This is obtained by utilizing the warm water from the jackets or by the heat of the exhaust. The following suggestion for using the last named method is contributed by a reader who experienced carburetion troubles.

I am sending you a rough sketch of a device I constructed to supply hot air to the carburetor, which is a Schebler having a tube like air intake. Both the intake and exhaust manifolds are on the same side of the motor, which made it an easy matter to install the device.

I took an ordinary tin funnel and compressed the large end, then cut out two places at the ends to fit the exhaust pipe as shown in the accompanying drawing. I next had a pipe made of heavy tin to fit the opening of the air intake and made this a drive fit. The other end of the tube was fitted over the spout end of the funnel, which was cut off near the funnel proper to obtain the same diameter as that of the air intake of the carburetor. The pipe was soldered to the funnel and the other end pushed into place and taped. The top of the funnel was

Components of Ball Bearings Used in Adjusting and Parts Requiring Care in the Work.

secured to the exhaust pipe by brass wire which was twisted tight. Since its installation I have obtained good results from the carburetor and use less gasoline than formerly. I am going to experiment with the device

when it becomes cold, as I believe that by squirting gasoline into the funnel end of the device I can get a rich enough mixture to start when it is very cold.

Showing How Jack May Be Employed for an Emergency Wheel Puller.

The device constructed by the reader is ingenious because of its simplicity and low cost. It is not, however, new. The Ford Motor Company fitted a similar arrangement on its four-cylinder model B touring car, which was marketed several years ago. Relative to the priming suggestion, it should aid in starting and the writer would appreciate a report on the results obtained.

### JACK AS A WHEEL PULLER.

Some types of axles require the services of a wheel puller to remove the wheel, and although one of these tools may be included in the garage equipment, it is possible that their service will be required on the road. If the puller is not carried in the tool kit and the wheel must be removed, it may be accomplished with the jack as shown in an accompanying illustration.

Remove the hub cap and place a piece of wood between the end of the axle and the base of the jack. Next pass a rope round a spoke, over the head of the jack and tie the other end of the rope to a spoke as shown in the drawing. It should be drawn and tied snugly. By operating the jack in the usual manner, the rope will be drawn sufficiently tight to exert a strong pull on the wheel, and tapping the head of the jack smartly with a hammer should start the wheel. It is best to use a piece of hardwood on the head of the jack.

### RADIATORS AND PRIMING RODS.

In the modern automobile the manufacturer has incorporated many conveniences, such as dash or steering column control of the air admitted to the carburetor, a device decidedly useful in

starting in cold weather. There are, however, many older machines where this enriching the mixture by closing a butterfly valve is obtained by actuating this member by a wire or rod passing between the openings in the radiator. Use of the wire results in wear on the fins, especially if the pull be exerted in such manner as to cause the rod to bear against the other metal.

It should be remembered that the material in the radiator is very thin and the point where the wire comes in contact is difficult of access for repairs in the event a leak is incurred. It is not a difficult matter to fit a piece of fibre having sufficient opening for the wire to pass through, in the cooler, thereby preventing injury to the fins.

### GENERATOR HINT.

Among the causes of failure of carbide generators is lack of attention. The average user is content with dumping out the residue and renewing the supply. To obtain efficiency the generator should be thoroughly cleaned, and when the water drips into a perforated receiver, this member should be removed and washed. The stopping up of the apertures is largely responsible for the delay in securing "gas" when one is in a hurry.

### WHEN SHORT OF KEROSENE.

Kerosene is still utilized in the lamps on a large number of cars and the cheapness of the

Suggestion of a Reader for Conveying Heated Air to the Intake of the Carburetor.

fuel does not prevent one being caught on the road with an insufficient supply, and where oil is not easily obtained. In the event the oil is

consumed in the side lamps, it is a simple matter to utilize the headlights, and while it is rare one will be caught without enough to fill at least the tail light by using what remains in the side members, it has been known to happen. The writer was caught in this predicament, through the wick in the tail lamp being very short. By using sufficient water to bring the kerosene up to and cover the wick, the trip was completed. Of course, the lamp must be taken apart and cleaned before being refilled with kerosene.

### RETURNS FROM NEW ENGLAND.

#### President of Kissel Motor Car Company Enjoyed His Trip Very Much.

The fame of the New England hills as a touring ground is such that annually a large number of people cross the continent to take advantage of the splendid opportunities afforded. One of the most recent parties to enjoy a vacation of this nature was that of President William L. Kissel of the Kissel Motor Car Company, Hartford, Wis., who has just returned from a trip, on which the speedometer registered 3490 miles.

There were several members in the party, as is indicated by the accompanying illustration, taken among the White mountains of New Hampshire. The itinerary included Niagara Falls, the Thousand islands, White mountains, Atlantic coast resorts, Boston, New York, Philadelphia, Pittsburg, Cleveland, Toledo, Chicago and Milwaukee. Not a single car adjustment was necessary throughout the long journey and the tire troubles totalled but one blow-out and two punctures.

### GRAPHITE CUP GREASE.

#### Street Railway Finds Dixon Product Valuable for Trolley Lubrication.

When it is remembered that the trolley wheel probably is the hardest worked part of an electric railway equipment, and seldom receives attention until there is trouble, the following letter from the Lake Shore Electric Railway Company, Fremont, O., received recently by the Joseph Dixon Crucible Company, Jersey City, N. J., maker of

Dixon's graphite lubricants, will prove of decided interest:

Referring to your communication, which was in reference to your graphite cup grease No. 2, which we are using on our trolley wheels: We have been using this for the past four or five years for trolley lubrication.

We manufacture our own trolley wheels and they are so constructed that we have an extra large chamber for lubricant. We use a graphite bushing for a .625-inch pin two inches long only. We take the graphite cup grease No. 2 and thin it slightly with oil, making it somewhat thinner in the winter than in the summer. This lubricant is then forced into the chamber of the wheel with a force pump in our shop and the wheel is then put into the harp attached to the pole and is ready for service, and this is all the lubricant that is required for the life of the wheel. In the majority of cases we use the bushing over again on the second wheel. We have an air press for forcing these bushings in and out of wheel.

During the past 16 years we have done considerable experimenting in trolley wheels and lubricants with different kinds of trolley wheels and different kinds of lubricants, and it has been our experience that the Dixon graphite cup grease No. 2 is the very best lubricant that can be obtained for the purpose. On trial equipments we have operated trolley wheels for 7000 and 8000 miles;

President W. L. Kissel, Kissel Motor Car Company, and Party in the White Mountains of New Hampshire.

however, in figuring up our average mileage on trolley wheels by the year, taking into consideration wheels that are lost, broken, and in some cases stolen, our average mileage is approximately 4000 miles.

Yours truly,

FRED HECKLER,  
Supt. M. P. & C.

Something more than two years ago, Dr. G. W. Bucklin, Muncie, Ind., purchased a Waverley electric machine, made by the Waverley Company, Indianapolis, and his experience with this car has been such as to indicate to his satisfaction that it is an economical proposition. He has paid \$22.58 a year for current, and his expenditures for repairs were 15 cents the first year and \$1.40 the second. The car is equipped with cushion tires and Edison battery, neither of which had occasioned any maintenance expense.

gress of March 3rd, 1879.

## LEGISLATION AND MOTORING.

The automobile industry may well question whether or not it is time to become actively interested in the matter of legislation. Each year, as the legislative season draws near, the list of proposed laws more or less inimical to the interests of motorists and motoring becomes so long as to occupy a much larger proportion of the attention of the legislators than almost any other one subject. Within the past two years the interests of owners and users of commercial motor vehicles have been seriously endangered, and last spring the owners of garages and service stations in several sections of the country were called upon to contribute their quota of tribute through special license fees or in some other

manner quite as unnecessary and objectionable.

It must be admitted that the motorists themselves are somewhat to blame, since in the beginning they were so much interested in the subject of good roads that they expressed themselves as willing to pay a special license fee, providing the funds thus collected were utilized in improved highway construction and maintenance. Through increased fees and because of their multiplicity in one form or another, the situation has now reached a point where it becomes of decided moment in the minds of those who are considering the advisability of making their first automobile purchase. It cannot be argued that these various fees do not have an appreciable effect upon the industry as a whole.

Although it has long come to be recognized that other interests benefit quite as largely because of good roads, the motorist still bears an increasing proportion of the expense. State and local commissions and officials hesitate to fulfill their part of the implied bargain and, wherever the question has arisen, are to be found arrayed against motor truck owners and users on the proposition of attempting to delay commercial progress by legislating against the modern method of transportation rather than by taking steps to place the roads and bridges in proper shape to meet the newer conditions.

Every person connected with the industry—manufacturer, dealer, garageman and owner—has a direct personal interest in the situation. Next month, candidates for public office will seek their support. There is abundant evidence that the industry must face this proposition in one form or another in several commonwealths during the forthcoming legislative sessions. Much good preliminary work could be accomplished by a consideration of the subject before reaching the ballot box.

For the first time in the history of Wisconsin, the new motoring law having gone into effect Aug. 1, it is possible to visit all the towns and cities in the state without danger of violating unknown ordinances. The new statute automatically annuls all local regulations, and the people of Wisconsin are so well satisfied with the result that it would not be difficult to interest them in the subject of uniform motoring laws for the several states.

## WITH THE CYCLECAR MANUFACTURERS.

Constructional Details and Special Features as Revealed by Producer of the Woods Mobilette--Francis R. Hoyt Designs the Falcon.

**R**EALIZING the public interest in the development of the cyclecar, The Automobile Journal has decided to devote space in each issue to this subject. Endeavor will be made to present mechanical descriptions of the various machines, so far as this information is available from the manufacturers. It will be understood that the situation at present is somewhat analogous to that which existed in the earlier days of the industry, in that the American cyclecar, at least, is more or less in its experimental stage. This should not be taken to indicate that the engineers and those engaged in their production have not studied fully the results obtained from some two years of service in Great Britain and on the Continent of Europe. Road conditions and other factors must necessarily prove of decided importance in determining the final design, but it is only reasonable to assume that present day automobile engineers will have little difficulty in solving the problems presented.

### THE WOODS MOBILETTE.

Francis A. Woods of Chicago claims to have conceived the idea of a cyclecar in 1906, which was four years before the appearance of the Bedelia, conceded to be the first cyclecar ever produced. It probably will not be maintained by Mr. Woods that at that time the idea was in concrete form, but it would appear that he began experimentation long before he knew that Barbeau had succeeded in producing a machine of the type he had in mind. In fact, the development of the Woods Mobilette seems to have been conducted wholly without reference to what was transpiring abroad.

In 1910 Mr. Woods began active work on a car, but for a time found difficulty in obviating what seemed to be a serious disadvantage in the seating arrangement. One day, while passing along the street he saw a boy who had built an imitation automobile out of bicycle wheels and a board between the two axles. On the front an inverted soap box served for the hood. For a steering gear, the boy had utilized a broomstick, which ran through the board close to the centre of the front axle, surmounted by a baby carriage wheel. One end of a piece of clothesline was tied

to the hub of each front wheel, with two winds around the end of the broomstick. From the fact that the boy straddled his board, Mr. Woods immediately evolved the tandem seating arrangement, which has been adopted by many makers both in this country and abroad.

The first model was completed almost two years ago. Subsequent road tests indicated its value from a practical standpoint, and the Woods Mobilette Company has been organized with headquarters at 1509 Michigan boulevard, Chicago. The lower floor is devoted to exhibition and salesrooms, while on the second floor are facil-

Front View of the Woods Mobilette Cyclecar.

ities for producing about 200 cars a month, it is believed. The company hopes to be ready to make deliveries early in October, thereby securing still another claim to being America's first cyclecar.

An accompanying sketch of the chassis has its principal parts lettered, so that it is possible to follow the accompanying description throughout in alphabetical order, beginning with the motor. This is located in front under a sloping hood of the so-called foreign practise, the position having been selected with a view to distributing

the load properly and so as to provide a free circulation of air. It will be understood from this that the motor is air-cooled. It is a two-cylinder, four-cycle unit of the V type, with bore of 3.125 inches and stroke of three, rated at 10 horsepower, but claimed to be capable of developing 14. The compactness of the power plant is still further suggested by the mounting of the magneto and carburetor in such manner as to eliminate the possibility of dirt, etc., and accessibility is afforded by lifting the hood from the front.

One of the features of the construction is the use of a specially designed friction transmission. The main friction drive wheel is indicated by b, and this is coupled directly to the engine. A counter friction drive disc c is designed to be

h to secure the desired change in speeds. This lever is moved forward to obtain the various forward speeds and backward for reversing the machine.

A plan view of the main frame is indicated by k, this being of one-piece pressed steel, light in weight and tested for strength to 300 per cent. more than required to carry and maintain the load of the car. The spring suspension is somewhat unique. The springs l are merely spirals attached to the chassis frame and partly coiled about the axles. These are held to be of sufficient leverage in length to insure absolute flexibility and easy riding. In addition, a rocker joint forward of the propeller shaft housing is designed for the double purpose of a torsion rod

Plan View Sketch of Woods Mobilette Cyclecar Chassis, Indicating the Special Features of Construction.

brought into and out of engagement with b, on much the same principle as the application of the clutch in standard automobile practise. The sketch shows this in part section so as to indicate the special fibre inserts, held to provide the highest frictional grip and long life. A third friction disc d is keyed to the main propeller shaft e, and fully trussed to insure strength. This is intended to be moved backward and forward along the face of the disc c to obtain the various changes in speeds.

Depressing the brake pedal f throws the wheel d out of engagement with the disc c and at the same time actuates the brakes on the rear wheel hubs. The clutch pedal g throws the counter friction wheel c out of engagement with the main disc b, while shifting the change speed lever

and a hammock suspension of the body. The shock on the rear wheels over rough roads is held to be transmitted to this rocker joint and thence back to the seats, thereby reducing the shock at the latter point to a minimum.

The propeller shaft is of one-piece steel, free from gears and universal joints, self-aligning and claimed to be absolutely free from thrust strain. This drives direct through a reduction gear in the rear axle housing. The wheels are of wire, interchangeable, and of the motorcycle type, being shod with 28 by 2.25-inch tires. The wheel-base is but 89 inches and the tread 30, with a maximum width of 35 inches. The height overall is 48 inches, and the weight about 450 pounds.

Another feature is to be found in the provision for a short turning radius. It will be noted

Side View of Woods Mobillette, Said to Be America's First Cyclecar.

that the chassis main frame is looped in at the front so as to permit of turning the front wheels to an angle of 45 degrees. The steering wheel and column are of heavy construction, and the throttle and spark controls are located on the wheel as in standard automobile practise, these being indicated by m and n, respectively.

The body is of pressed sheet steel, strongly braced and ribbed, and so constructed that the rear seat is detachable, permitting of the installation of a delivery box instead, and thereby providing for two vehicles in one. The upholstery is in leather. The running boards, fenders and splash guards are formed of special sheet steel, eliminating rivets, etc., and securely held to the main frame by drop forged steel arms. The fuel tank is located in the dash, readily accessible, and provides a gravity feed for the carburetor. The general appearance of the car is still further brought out in the accompanying photographic reproductions.

### THE FALCON DESIGN.

Following the announcement, something like a month ago, that Francis R. Hoyt of Cleveland, O., had been engaged by certain Cleveland men to produce the design for a new cyclecar, comes the statement that the Falcon Cyclecar Company is about to be incorporated in that city with capital of \$250,000. Temporary quarters have been secured at 2344 East 105th street, and it is understood that a factory will be erected on that street, between Quincy and Quebec streets.

The machine, which is shown in an accompanying illustration, bears a very close resemblance in some respects to those produced in France and other sec-

tions of Continental Europe, although the two passengers are seated side by side as is the practise obtaining in Great Britain. However, there are features in the general design and appearance which are entirely new.

The Falcon is equipped with a two-cylinder, air-cooled motor, set forward behind a grating, and beyond the fact that the unit has a piston displacement of 70 cubic inches and is rated at 10 horsepower, no further information is given.

It is stated, however, as one of the special features of the design, that provision is made for starting, or cranking, the engine from the seat, this being one of the functions of the automatic electric lighting and ignition system.

Power is transmitted by a friction transmission, and final drive is by a 1.125-inch white strip V belt. In this connection it is proper to refer to the second feature, which might be considered first in importance. The method of changing speeds is accomplished by a second or auxiliary wheel within the outer steering wheel, this obviating the necessity for reaching for the gear shift lever. Apparently, this design closely imitates the electric gear shift proposition, and, of course, the scheme is to move the driven disc into and out of engagement with the driving disc, as with the usual friction transmission.

The suspension is termed a semi-underslung type, and while the photograph does not disclose the feature, the designer states that the front springs act upon a pivotal principle, in that road shocks are not communicated from the wheels to the body. The general effect is that of a low rakish vehicle, which is still further accentuated by the use of light wire wheels, shod with 28 by three-inch tires. The wheelbase is 96 inches, and the tread 36. The weight of the car complete is 325 pounds. The driver is located at the left.

# IMPROVED ROADS AND MOTORING LAWS.

## Lincoln Highway Association Announces Route of Its Proposed Transcontinental Concrete Road--Congress to Consider a New Federal Registration Plan.

AS A result of much study and a careful investigation of the various routes across the country, the Lincoln Highway Association has completed the first step in establishing the transcontinental highway between New York and San Francisco, through the states of New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Iowa, Nebraska, Colorado, Wyoming, Utah, Nevada and California. The official route is designated on an accompanying map, and is still further identified by stating that it shall pass through the following centres:

New York City; Jersey City, Newark, Trenton and Camden, N. J.; Philadelphia, Lancaster, York, Gettysburg, Chambersburg, Bedford, Ligonier, Greensburg, Pittsburg and Beaver Falls, Penn.; Canton, Mansfield, Marion, Kenton, Lima and Van Wert, O.; Fort Wayne,

of the country. Some of the points either on, adjacent to or connected by branch highways are Gettysburg, Penn.; Washington, D. C.; Canton, O., the resting place of President McKinley; the Mammoth Cave of Kentucky; the home of Lincoln in Springfield, Ill.; Lincoln's birthplace in Kentucky; the scenic splendors of Colorado; the Grand Canyon of Colorado, and the many and varied wonders of Utah, Nevada and California. In part the proclamation sets forth the following:

Whereas, our chief step toward the desired goal is to crystallize in the public mind the practical wisdom of the route selected, therefore be it recorded here: First, that in general it has been for nearly a century and is today the main Overland Trail, and that part lying west of Chicago is known by that historic name; second, it is the most direct and most practical route as to grades, curves and general topography; third, it is to the great-

Map Indicating Route of the Lincoln Memorial Highway from New York to San Francisco as Selected by the Lin

Ligonier, Elkhart, South Bend, LaPorte and Valparaiso, Ind.; Chicago Heights, Joliet, Geneva, DeKalb, Rochelle, Ashton, Dixon, Sterling, Morrison and Fulton, Ill.; Clinton, Dewitt, Cedar Rapids, Tama, Marshalltown, State Centre, Ames, Grand Junction, Jefferson, Dennison, Logan and Council Bluffs, Ia.; Omaha, Fremont, Columbus, Central City, Grand Island, Kearney, Lexington, Gothenberg, North Platte, Ogallala, Big Spring, Chappell, Sidney and Kimball, Neb.; Julesburg, Sterling, Fort Morgan, Denver, Longmont, Loveland, Fort Collins, Col.; Pine Bluff, Cheyenne, Laramie, Rawlins, Wamsutter, Point of Rocks, Rock Springs, Green River, Granger, Fort Bridger and Evans, Wyo.; Echo, Parley's Canyon, Salt Lake City, Garfield, Grantsville, Timpkie, Kanaka Ranch, Fish Springs, Kearney's Ranch and Ibapah, Utah; Tippet's Ranch, Shelburne Pass, Ely, Eureka, Austin, Fallon, Wadsworth, Reno and Carson City, Nev.; Truckee, Auburn, Tallac, Placerville, Sacramento, Stockton, Oakland and San Francisco, Cal.

In issuing the statement concerning its decision in this matter, the association explains that its directors have endeavored to select a route of easy grades, yet combining the scenic splendors

est extent improved and marked throughout its length; fourth, it is capable of being established as a fitting memorial highway at the least cost.

It will be remembered that the Lincoln Highway Association was organized for the purpose of building a concrete highway from ocean to ocean. The initial work was undertaken by Carl G. Fisher of Indianapolis, and the association was formed only this last summer. A grand total of \$10,000,000 is to be raised to complete the work. So far as possible, however, it is proposed to utilize existing highways, and wherever state or local authorities desire to build sections of the highway according to the plans and specifications of the association, financial aid will be given beyond that appropriated for the work in question. The announcement of the route is but the beginning

of a greater activity, although it is hoped that a substantial proportion of the road will be constructed before the opening of the Panama-Pacific exposition in 1915.

### MICHIGAN'S HIGHWAY PLAN.

#### Citizens Will Vote on the Question at the General Election in 1914.

Michigan has been pointed out as a striking example of the manner in which so-called state aid has worked to create a highway system which begins nowhere and ends nowhere. In other words, each town or county has been permitted to supervise its construction work without regard for the needs of the whole state, with the result that such improved roads have not been laid out with a definite idea of connecting the entire system. The legislature of 1913 evolved a new plan, which is to be presented to the people for ratification at the general election in November, 1914. The plan is set forth more fully in the following

are indicated by lines drawn through the cities from side to side and end to end of the state, including the upper peninsula.

It is the idea of the promoters of the system to make it an example of thoroughly up-to-date road construction that will be an object lesson to the rest of the country. This will be the effect if the work is carried out as planned, although the primary purpose is to secure the best road system at the least expense for construction and upkeep. In accomplishing this they will be doing what all other parts of the country, and foreign countries as well, should do.

They realize that the only kind of road that is economical in the long run is one that is permanent; that is, one that will not go to pieces or wear unduly under mixed horse and motor vehicle traffic that is rapidly increasing in both number and weight of units. By saving the heavy annual expenditures that other states are making for the repair and resurfacing of water-bound and bituminous macadam roads, they will soon repay the slight excess in first cost of the permanent roads and thereafter have more money for the extension of the system. Instead of becoming an increasing burden for maintenance, every mile of the permanent roads will effect an actual saving in road funds, which will be supplemental to the savings effected by farmers and others in the cost of haulage.

A leaf is to be taken directly from the experience of the board of road commissioners of Wayne county, of which Detroit is the county seat. After building concrete roads for the last five years the Wayne county board has adopted them as standard construction and now builds nothing else. The 65 miles of these roads leading out of Detroit bear the heaviest and most varied traffic of any county roads in the state, yet they have not cost \$100 a year for repairs to the entire system and the oldest

Lincoln Highway Association, Which Proposes to Construct a Concrete Road Surface Throughout the Entire Distance.

communication from H. W. Perry, secretary of the good roads committee of the Automobile Chamber of Commerce, as the national association of automobile manufacturers is known under its present designation:

Michigan is headed directly for first place in the matter of good roads. If the voters and the road commissioners carry out the present programme, she will be the first state in the Union to have a complete trunk line system of permanent highways. The legislature of 1913 authorized a referendum vote on an amendment of the constitution to allow the issuance of bonds to pay for the construction and maintenance of such a system. The citizens will vote on the question at the general election in November, 1914.

A network of main roads connecting all important cities in the state is urged by the Michigan Trunk Line Highway Association, which is engaged in working up sentiment in favor of this great public improvement. The legislature has adopted the proposed system, which is shown by a map of the state on which the proposed roads

and most used roads do not show more than .125 inch wear in the centre. These roads are made of washed gravel pebbles, clean sand and Portland cement, mixed in the proportion of six, three and two parts respectively. They cost from \$1.02 to \$1.45 cents a square yard, or from about \$7000 to \$13,000 a mile, according to width and amount of work required on foundations, drainage, culverts and bridges. These figures include all incidental costs of surveying, administration, etc. While the first cost is somewhat higher than that of first class water-bound macadam roads, it is just about the same as bituminous macadam in which the crushed stone and tar are mixed before laying.

The Wayne county commissioners have had experience with many other kinds of roads, and it was this identical experience with the macadam roads and the excessive cost of keeping them in repair that led the commissioners to experiment with a material of known durability. These permanent roads have given such general satisfaction that they have become famous not only throughout Michigan, but among road authorities all over the United States.

They are a boon to the farmer as well as to the city merchant and manufacturer. Farmers find that they can haul two or three loaded wagons over the dirt, gravel

or macadam roads to the concrete roads and there hitch them together and haul them the rest of the way over the concrete road with a single team, taking the other team or teams back to work in the field. The roads never are muddy or dusty and never have chuck holes. While the Wayne county roads are not more than five years old, there are concrete streets in Bellefontaine, O.; Richmond, Ind., and Chicago that are 21, 17 and 10 years old respectively, and which show very little wear and are apparently good for many more years of use under heavy traffic. In Richmond the cost of maintenance has been nothing; in Bellefontaine it has not exceeded \$150 for half a mile of street in more than a score of years; in Chicago no data on cost of repairs have been collected, but the pavement has worn very well.

If the Wolverines are alive to their opportunity and vote for the amendment that will secure to them a system of permanent trunk roads that will always be in good condition, that will last 50 years or more and cost only about one one-hundredth as much to maintain as the road systems that have been the boast of Massachusetts, Connecticut and New Jersey for the last 10 years, they will have good reason to be congratulated and to feel proud of their accomplishment.

### ROAD CONSTRUCTION METHODS.

#### Automobile Chamber of Commerce Takes Definite Action in the Matter.

The Automobile Chamber of Commerce, the national organization representing some 95 producers of pleasure and commercial vehicles, has taken definite action, through its commercial vehicle committee and the board of directors, concerning road construction methods. The association sets forth, "That we realize thoroughly the necessity of improved conditions \* \* \* and believe it is advisable to adopt the construction that, after thorough investigation, will give the greatest permanency, first cost being of lesser importance," and the resolutions adopted embrace the following declaration of principles:

1. Highway construction is a scientific and engineering problem.
2. Proper location, grading and drainage are first essentials of any good road.
3. Highways should be of a character directly suited to the kinds and volume of traffic using them. It is uneconomical and a waste of time and money to build roads unsuited to the volume and character of traffic and of short durability.
4. Road foundations, culverts, retaining walls and road base should have a durability equal to or exceeding the life of bonds issued to pay for the construction of the roads.
5. When appropriations are made for road improvement, suitable and sufficient provision should be made for maintenance of the improved roads during the life of the bonds issued to pay for them.
6. Volume of traffic and kinds, speed and weights, with loads of vehicles using the roads should be ascertained before beginning the construction of a state road by taking a traffic census, and the rate of increase and change of character should be calculated well into the future.
7. Construction or reconstruction of all main through roads between important trade centres, state capitals and centres of large population (50,000 or more), not more than 100 miles apart, should be of permanent character.
8. Roads which sustain a considerable volume of mixed horse and motor vehicle traffic should have a surface that will not ravel under such traffic, that will not become dusty by wear and the effects of weather, that will be impervious to water and will not be loosened by frost.

9. Until such time as traffic over subsidiary roads and relatively little used country roads warrants improvements with permanent construction they should be maintained in serviceable condition for the traffic using them by relatively inexpensive methods such as dragging, or by the application of gravel, sand, clay, shell, etc.

10. Bridges and culverts should be of sufficient strength to carry the traffic that can be sustained safely by the roads of which they form a part. Pending the rebuilding or strengthening of bridges to such standard, signs announcing their safe capacity should be displayed prominently upon them.

11. Traffic development is an economic necessity and the capacity of roads and bridges should be adequate to the industrial and commercial needs of the communities they serve.

### FEDERAL REGISTRATION AGAIN.

#### Georgia Congressman Introduces Bill for This Purpose in the House.

The subject of federal automobile registration is to be reopened in Congress, the movement having its origin in the South this time. One of the arguments against the proposition when it was considered before found its basis in the doctrine of state rights. The text of the new bill, introduced by Congressman Adamson of Georgia, is as follows:

To regulate the interstate use of automobiles and all self-propelled vehicles which use the public highways in interstate commerce.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That until further provision is made by Congress, the use and operation of all automobiles and all self-propelled vehicles using the public highways in interstate commerce shall be regulated in conformity with existing laws of the states, territories or districts, respectively, wherein the owners and operators of such vehicles may reside, or with such laws as may hereafter be enacted for such states, territories or districts, respectively, for the purpose, with this following qualification: No person who shall have qualified by complying with the laws and regulations of the state, territory or district of his residence to use and operate such vehicle or vehicles shall be required in any other state or territory or district into which he may go for business or pleasure to make any additional registration or take out any additional license in order to use and operate any such machine. The certificate of the proper local officers shall be taken and accepted in all states, territories and districts as competent and sufficient evidence that such person has complied with the laws and regulations of the state, territory or district of his residence, but nothing herein contained shall be construed to exempt any person from the police regulations of any state, territory or district into which he may go, save only the additional registration and the taking out additional license in case he shall have complied with the laws and regulations of his own state, territory or district.

Section 2. That all laws and parts of laws in conflict herewith are hereby repealed.

The Norwich Chauffeurs' Club has been organized in Norwich, Conn., with the following officers: President, James H. Craney; vice president, Edward Harper; treasurer, James P. Sheridan. The club has established permanent quarters in the Carpenter block, and has a charter membership of 50.

## CORRESPONDENCE WITH THE READER.

**Dish of Ford Car Wheels.**

(1647)—Why is it that the front wheels of my model T Ford car are dished? I do not notice this feature in other cars.

W. H. H.

Providence, R. I., Sept. 11.

The Ford Motor Company explains its reasons for the construction in its publication, the Ford Times, and the illustration presented at Fig. 1 shows the principle involved, it being held by the company that the nearer to an alignment the centre of the spindle bolt and the pivot point of the wheel are when turning, the easier the car will steer. If it were possible to bring the centre of that part of the tire which is upon the ground to a point exactly under the joint of the steering knuckle, the arrangement would be ideal. To secure this alignment, or as nearly as possible, the wheel is dished.

A plumb line dropped through the centre of the spindle bolt would strike the ground just 2.0625 inches from the pivot point of the wheel. To the nearness of the two points is attributed the easy steering qualities of the machine.

**Alcohol as a Fuel.**

(1648)—What would be necessary in order to use denatured alcohol as a fuel instead of gasoline? Could the two be mixed? Alcohol is rated as a carbon remover.

C. A. F.

Providence, R. I., Sept. 10.

A special carburetor or one so modified as to permit of its use would be necessary. There are disadvantages besides the high price of alcohol which prevent its adoption with conventional forms of motors and carbureting devices. The most important of these is thermal or heat efficiency. This is a vital factor, when alcohol is to be used in appliances designed for the use of gasoline. This disparity in heat value means that it will be approximately twice as costly as gasoline, allowing that both were sold for the same price a gallon. Weight for weight, the heating value is but .6 that of gasoline, and according to experiments carried out by Prof. Lucke of Columbia it has been determined that all other factors being equal, a small engine will require 1.8 times as much alcohol as gasoline a horsepower-hour. Another disadvantage is that it has a higher vaporizing point than gasoline and a special modification of the carburetor is essential to secure complete vaporization of the alcohol and maximum efficiency. A third disadvantage is that it is easy to burn an excess of alcohol without detecting it; much more so than with gasoline.

If other conditions are considered, however,

the two fuels become more at a parity. Alcohol vapor can be compressed to a higher degree than gasoline vapor before it will ignite prematurely. This fact tends to balance the discrepancy between the relative heating values and while alcohol contains less heating units its thermal efficiency is greater. The thermal efficiency means the degree of utilizing all of the heating value of any combustible, and as the thermal efficiency is greater with a gas as the degree of compression is possible before ignition is increased, it will be seen that the quality of alcohol to stand a higher degree of compression compensates for the difference in the amount of heat units a pound of fuel.

In an engine designed to use alcohol and with proper vaporizer or carburetor, alcohol will develop as much power a pound as gasoline working under its best conditions.

Less air is required to burn alcohol and there is practically no residue left in the engine, because no carbon is left free or in an uncombined state.

Relative to the mixing of alcohol with gasoline and utilizing it as a fuel, it would not be practical because of the characteristics of the two liquids, difference in specific gravity, etc. The simple experiment of trying to mix the two will demonstrate the points involved.

Fig. 1—Illustrating Dish of Front Wheels of Model T Ford.

**Function of Ammeter.**

(1649)—In a recent issue I noted a description of an ammeter among the accessories described. I understand their service with dry cells but believed that only a voltmeter could be employed with storage batteries. I also note that the lighting systems on cars nowadays have an ammeter. How is it used and why can it be used?

J. A. S.

San Diego, Cal., Sept. 8.

The ammeter utilized in connection with the electric lighting systems indicates at all times the amount of current being produced by the generator or discharged from the battery. One

of these, a Hoyt, made by the Hoyt Electrical Instrument Works, Penacook, N. H., is shown at Fig. 2, and it will be noted that normally the indicating hand rests at zero.

Fig. 2—Lighting Ammeter.

When the needle points to the left of the zero point on the scale it denotes that the cells are supplying electricity to the lights, or discharging, the amount of current being indicated by the point at which the needle rests. For example: If eight amperes are being drawn from the battery, the hand would point at the figure 8.

When the needle swings to the right it shows that the generator is charging the cells and the amount of current passing is indicated. The ammeter is a tell tale in this respect. It does not, however, show the amount of current in the battery. There is no instrument made which will show this. The voltmeter referred to indicates the voltage or strength of the current, not the quantity.

#### Dual Independent Ignition.

(1650)—Am rebuilding a touring car into a roadster and desire some information as to installing a magneto. The motor is of the L head type and has but one set of spark plugs. The ignition at present is a battery and a four-cylinder coil. I wish to eliminate the coil, fitting a distributor in place of the timer, and employ but a single unit. I wish to install a magneto, a true high-tension. How could it be arranged so as to employ one set of plugs, or would it be better to employ the exhaust valve caps for the second set? INFORMATION.

Galesburg, Ill., Sept. 14.

The exhaust valve caps could be altered to take one set of the plugs, depending upon design and thickness of the material. The disadvantage of the plan is that with these caps utilized for the battery spark plugs their points are exposed to more or less sooting and heating effects because they are in the path of the exhaust gases and are not cleaned by the incoming mixture as when located in the intake caps.

By using double spark plugs as shown at Fig. 3, the regular spark plug positions could be utilized. These plugs may be obtained at any large supply house, and permit of using either circuit as desired. The wiring plan is also shown in the drawing and although but one switch, that employed with the magneto is shown, a second member would be needed for the battery circuit.

#### Clashing of Gears.

(1651)—Having made my first investment in a motor car, a second hand one, I find that after considerable driv-

ing I am unable to shift the gears in the transmission without a good deal of noise and accompanying trouble. The clutch is a cone. I am advised that the fault is not mine, but that of the design and natural wear. In my opinion the gears are not going to last forever and I wish to know if there is an inexpensive method of curing the trouble. Noting that you give advice to your readers, and being a subscriber, I am taking advantage of the opportunity for obtaining information.

NEW SUBSCRIBER.

Rochester, N. Y., Sept. 17.

It is possible that the design is such that the inertia of the flywheel is not overcome or that the clutch bushing or bearing is so worn that the clutch drops down on the spindle. This last named condition would cause the periphery of the male member to bear against the female (flywheel) member even when the clutch pedal is fully depressed. The contact may be slight, but enough friction will be set up to cause the female portion to impart motion to the cone member.

In order to effect silent meshing, the pinions to be engaged must rotate at approximately the same speed, and if one be turning faster than the other, the slower member must be brought up to the same number of revolutions as the other, or vice versa. This is usually accomplished by decreasing or increasing, as the case may be, the speed of the motor which imparts energy to the female portion of the clutch, thence through the male member and shaft to the constant mesh gears of the transmission.

The bushing of the clutch should be inspected, also the clutch (male) examined for spinning after it has been withdrawn and with the motor operating. If the clutch fails to come to a complete stop it will denote that it is dragging and the fault should be corrected without delay.

Fig. 3—Wiring Plan for Two Independent Ignition Systems with Single Set of Spark Plugs.

If the clutch comes to a stop the examination must be continued to the gearbox, which should be emptied and cleaned. The shaft bearings may

be worn so badly that the gears will not mesh easily. This may be noted by changing speeds.

With the clutch operating properly and the transmission bearings in order, it may be assumed that the fault is because of the design. The best and simplest repair is to fit a clutch stop, a device which is employed on modern cars and which is of value in that quick and quiet changes of gears may be made without the clashing referred to. The object of the stop is to retard partially or wholly the spinning of the clutch shaft and enable the operator to change up or down, as the case may be, without grinding of the pinions in the gearbox.

Two forms are shown at Fig. 4, that at the left being adaptable to a cone clutch and suitable to a car having a cross member upon which the device is mounted. It consists of a five-inch round metal rod which is threaded at one end, and fitted with a wooden block having a leather facing at the other extremity. To the cross frame is bolted a T piece and the latter is threaded to take the rod, which is held securely by lock nuts. This arrangement makes for adjustment as well as for wear.

Where the design is such that it cannot be placed upon a cross member or on the gearbox, the sub-frame may be utilized as shown at the right of the sketch. A plate is bolted to the frame and the former drilled to take two bolts, these being employed to lock the stop proper. The latter is constructed of spring steel and slotted to permit of adjustment for position, as well as wear of the leather pad. In setting the device the clutch is thrown out, the stop moved forward until it comes in contact with the periphery of the clutch and the bolt locked. In adjusting these devices it should be borne in mind that they should not be so set that a harsh engagement will follow. Their object is to slow down the spinning member to the required speed for meshing the gears, not for stopping the clutch entirely. It will require but a short time to learn the "feel" and if properly adjusted and operated will make changing up or down an easy matter and eliminate the grinding noise. The material required is not expensive.

#### Efficiency.

(1652)—In reading your magazine I notice the word efficiency is employed considerably in mechanical articles. What is the definition of the word as implied in the articles?

Niagara Falls, N. Y., Sept. 20

CURIOUS.

Efficiency is defined in engineering as the quotient "output" divided by "input"; that is, the energy utilized divided by the energy expended. The difference between the input and the output is the loss or waste of energy. Expressed as a fraction, efficiency is nearly always less than unity. Expressed as a per cent., it is this fraction multiplied by 100. Thus it may be said that a motor has an efficiency of .9 or of 90 per cent.

#### AFTERMATH OF THE TOUR.

##### Haynes Automobile Company Reports the Sale of 247 Cars as One Result.

When the recent Indiana-Pacific tour of the Indiana Automobile Manufacturers' Association was first projected it was anticipated that it would prove of decided value in securing new

Fig. 4—Construction and Fitting of Clutch Stops to Prevent Undue Spinning of Clutch Shaft.

business in the territory visited. The results have been quite sufficient to indicate that this view of the proposition was correct.

The Haynes Automobile Company, Kokomo, Ind., which had two Haynes cars, Nos. 12 and 13, in the tour, reports the sale of 247 machines as a direct result of the tour. The orders were collected as follows: Kansas City, 125; Salt Lake City, 50; Ely, Nev., 10, and Corning, Cal., 10. In addition to these wholesale orders from dealers, immediately after the tour was concluded Sales Manager George H. Strout received the following telegram from Gov. George H. Hodges of Kansas:

Enter my order two six-cylinder, five-passenger Haynes cars, equipped with mechanical tire pump.

Charles Terres Weymann has declined his appointment as representative of the United States in the fifth race for the Gordon-Bennett cup.

## CHARACTERISTICS OF HEAVY FUELS.

### Part III—Conditions Resulting from Varied Speed Coupled with Throttle Control When Carbureting Kerosene in a Gasoline Motor.

IN THE previous installment it was shown that variation in the speed of the four-cycle gasoline automobile engine was obtained by quantity regulation of the fuel, and that the air supply was so controlled as to provide practically the same mixture at all speeds. The effects of these variables were also outlined. The immediate result of varying load in the automobile engine utilizing heavy fuels is varying speed, the ultimate outcome of which is many headed, including as it does variation of air influx and in compression temperatures. Varying the density of the charge drawn in by the suction stroke of the engine raises or lowers the pressure of compression, therefore the heat of the compressed charge varies correspondingly. The effects of varying air

The same authority holds that it is difficult to get a small auto spraying engine to run both slowly and regularly, and that any heavy fuel carburetor will demonstrate this, in that the smoke grows persistently worse. The diagrams at Figs. 11 and 12 illustrate action of heavy fuel engines under overload, representing in one case an engine on overload and in the other, starting from all cold. The curves are approximate sketches only. A is the overload, B the speed, C the compression temperature, D the value of the vaporization resultant from compression heat, E the character of the spray, F the internal cylinder condensation and wall action.

#### Result of Overload.

Fig. 11 shows an engine that has been running on regular load subjected to an increasing resistance as indicated by the curve A, which would bring the machine to a standstill at ordinate L. The curves show the speed B falling with the increase of load, the temperature of compression also falling with the load, and similarly a degeneration in the quality of the spray E, while the condensation F increases as the speed falls. The engine is fitted with a float feed, but has a constant area of air inlet to the fuel spraying jet. It is assumed that if the action of the engine could be maintained over the peak of the load indicated, it would continue to operate satisfactorily under a normal load. Under the conditions presented, the spray has degenerated greatly as to quality. If this were remedied at the ordinate M, it is probable the engine at reduced speed would surmount the peak.

#### Effect of Air.

In the early types of marine engines having a small air spraying orifice and a separate hand controlled air inlet, if the machine showed signs of stopping, the extra air was cut off. The speed would then pick up and, ignoring the load curve, the state of things in the cylinder was similar to the amended curves as indicated in dotted line. The rise of the speed curve B<sup>2</sup>, the sustention of the compression line at C<sup>2</sup> and the internal vaporization D<sup>2</sup>, and the lessening of internal condensation F<sup>2</sup>, followed up by the improvement in spraying power and spray quality E<sup>2</sup> upon the increased air blast of the fuel spraying jet, is resultant upon shutting off the main air at the point

Fig. 11—Showing Engine Operation on Regular Load Subjected to an Increasing Resistance as Indicated by Curve A, Which Would Bring the Machine at a Standstill at Ordinate L.

flow in intake pipes was illustrated diagrammatically at Fig. 2.

An English engineer, who is an authority on engines and who has experimented to a considerable extent with heavy fuels, states that a very little consideration will convince the designer that the varying character of the spray—that is, variation in the degree of fineness to which the fuel is broken up—is a great evil and must receive attention in any endeavor to perfect an auto spraying engine. Degeneration in the character of the oil spray attends reduced piston velocity, so that unless the variable speed oil engine designer recognizes this, he is likely to go astray in planning.

M. It would appear that the re-establishment of a high velocity past the fuel jet saved the engine.

Fig. 12, lettered as Fig. 11, represents starting

Fig. 12—Representing Starting an Engine from All Cold and Gradually Lessening Condensation Until It Becomes a Constant.

an engine from all cold with the enormous condensation which gradually lessens until it becomes a constant. Compression temperature and its effect on the charge rise with the speed, and the character of the spray improves rapidly. In internal combustion gasoline engines high speed favors results.

One authority on heavy fuel motors holds that all kerosene engines tend to knock when their speed falls because of too high a gear, that is, when it is necessary to change to a lower gear; that degeneration of the fuel spray may result in the varying changes of control, but the class that least shows the tendency is that where direct vaporization is the basis of the feed preparation cycle. This is in accord with the theory which ascribes oil engine bumping to the presence of liquid fuel in the cylinder as distinct—that is to say, from vapor.

#### Value of Compression.

Varied speed from varied load, coupled with throttle control, results in a number of conditions, difficult to schedule, but one factor may be considered. Under the effect of charge variation by throttle valve the value of compression must needs vary widely. Assuming a throttled engine at high speed to have a certain volumetric efficiency, such efficiency is considerably lessened when running slowly with the throttle open, when practically a full charge enters the cylinder.

In variable speed oil engines controlled by the throttle the value of compression varies, for example, from a maximum to .25 thereof. The engine charge has, therefore, to withstand the effect such a variable factor may exert upon the combustion cycle. The heat of compression can ef-

fect vaporization, but as the compression is variable so also is the heat; so also must the amount of combustible vary for, sensitive to this heat, the charge condition must be affected, and more or less vapor must be added or deducted at the end of compression. In other words, varying load resulting in varied speed, varies compression, which varies internal cylinder heat, causing a variation in the amount of combustible, and if this should not apply under all running conditions it must do so at such times as varying air velocity in the intake pipes causes a degeneration in the spray character.

The times when troublesome exhaust may be looked for from a gasoline engine with kerosene carburetor are: First, at overload, or when the load increases beyond that well within the engine's capacity, and the speed in consequence falls; second, when it is endeavored to run the engine slowly, as when car is standing still; third, when control requires rapid changes of gear accompanied by sudden and irregular engaging and disengaging of the clutch.

In the first and second conditions it may be assumed that there is degeneration in spray quality, but there are other factors, for in the one case (overload) the throttle will be open; in the other it will necessarily be closed, and under the latter conditions full compression cannot be expected. The penultimate efforts of engine action in both cases are characterized by the discharge of offensive odor, popping in the intake, etc., all as the result of imperfect aeration; missing fire and engine charge impoverization by reason of the failure of normal medium for rendering such amenable to the combustion process. These conditions are simple, relatively at any rate to the third

Fig. 13—Engine Without Throttle Control, and Effects of Disengaging and Engaging the Clutch, Etc.

state, where the engine is alternately relieved of load and put under temporary overload, all under many varying conditions.

The act of accelerating before engaging the clutch; the slowing of piston speed on clutching; the freedom at one moment from all load on dis-

Fig. 14—Showing Effects of Starting of Heavy Car from Standstill on Engine Action.

engaging the clutch and the instant subvening of that which, but for stored flywheel energy, would be a real overload; the speeding up of the engine as it warms to its work, all under the influence of a throttle that varies, not only in induction on charging stroke, but also the compression temperature curve; the effects further subvening of a varying condensation factor in the cylinder, are some of the results of engine control to meet varied load, while accepting concomitant varied speed. This running condition shows up clearly the difficulties in designing heavy fuel carbureting appliances. Could constant fuel spraying be assured at all speeds, the slow speed overloaded and the slow running underloaded, engine condition could be improved greatly, for the effect of varying compression temperatures is less noted when the engine charge is of a high class, which is where the combustible is finely triturated, thoroughly vaporized and has oxygen well disseminated among the individual clusters of hydrocarbons. The result of such a condition is what may be termed high carburetion. In such a state the fuel particles have aerial envelopes, and in this condition the explosive charge best withstands compression resists; that is to say, the tendency to condense when the temperature of compression falls, so that fine fuel spraying, unless seconded by complete vaporization, may fail to show its full benefit.

In the third condition, that of quickly disengaging the clutch to the maximum of acceleration, as in gear changing, a degenerate mixture must ascend, differentially, to a more refined state, therefore the act of disengaging the clutch is to increase the amount of combustible suit-

able for combustion. Practically, such a condition enriches the mixture, for not only is there the factor of increased feed from increased air velocity, but also an increase in the factor of combustibility, for the increase in piston speed has added to the vapor forming and vapor maintaining power of rising compression temperature. The effect of disengaging the clutch should be to enrich the mixture charge, and the smoking effect would be noted in the exhaust, as may be seen in practise.

#### Air and Fuel Proportions.

Formerly it was held that the proportion of fuel to air was the factor requiring attention in kerosene engines adaptable to automobiles. R. Owen Allsop, an English authority on heavy fuel engines, states:

Important as is the question of reasonable proportioning of the element and a fair state of carburetion, even a coarse spraying engine may be made, on regular load, to give a reasonable exhaust. If we accept this, which anyone may test for himself, and which, as far as the writer is concerned, has been carefully ascertained, there must be other causes prejudicing combustion. For if it is possible, as can be demonstrated, to run an oil engine under constant load, maintaining a constant fuel supply and yet be able to play with the air inlet from a maximum say to one-fourth thereof, plainly the state of the art is that the question of mixture, as such, is solved; and if mixture qua mixture is not the cause of oil engine exhaust—where a high state of carburetion pertains—then some other cause is at work. To take a note of the obvious, nothing is so grossly apparent as that varied speed varies air velocity in induction pipes, and it needs no explanation that the quality of or the fineness of the spray is a measure of the vigor of air blast directed against the fuel jet. Then, obviously again, the act of varied air rush alters the size of the fuel spray globules.

Imagine a steam boiler furnace fed in some way with coal, and that there is an endless belt feeding the fuel into the furnace. The internal effect of varying piston speed in oil engines having auto spraying by motor piston is as though we at one time passed small coal along the feeding belt, and at another moment neglected to break the coal, while occasionally allowing massive

Fig. 15—Illustrating Conditions Taking Place on Two Clumsily Performed Disengagements of Clutch with Car on Level.

lumps to pass to the furnace. Combustion results here would be hopeless and we might as reasonably expect a locomotive driver to be on time if his fireman fed in coal of widely different size as that an oil engine should

show constant combustion results where at one time the feed is a true mist, at another a gross spray, and yet again, accompanied at intervals by coarse oil drops, so proof against compression heat and even the fiery ordeal

Fig. 16—Effect of Two Gear Changes with Car Climbing a Steadily Increasing Gradient.

of the full blast of combustion that they pass out of the exhaust still as individual units, even if greatly reduced in size. This seems the point for inventors. Unless grasped, the efforts at constant mixture making are futile, for where the gasoline carburetor designer has progressed his heavy fuel confrere has great leeway to make up.

#### Effect of Varying Conditions.

The drawings (Figs. 13, 14, 15, 16 and 17) are sketch diagrams co-ordinating load, speed and various conditions on motor car engine running and control. The curves are approximations only, and without basic zero or scale. The ordinates indicate position of disengaging and engaging the clutch. The reader is cautioned against attaching any significance or import to curve details, the diagrams being utilized to explain the points involved. In all diagrams, A is the load—that is, the resistance against which the prime mover operates; B, the piston speed—the average of such speed; C, the temperature of compression; D, the amount of internal vaporization resulting from adiabatic air compression—the value of the compression heat in completing vaporization commenced in the external vaporizer or in initiating vaporization from fine spray. It stands for the effect of compression on the quality of the engine charge. E is the spray character—that is, the fineness (positive) and the coarseness (negative); F is the factor of wall action—the internal condensation cast upon the engine surfaces. Added in Fig. 15 are G, the vaporizer temperature, or, more correctly, the value of the heat going to the vaporizer, and H, the amount of fuel sprayed. Added to Fig. 16 is J, the amount of heat going to the water jacket.

#### Action of Unthrottled Engine.

The engine is assumed to be an out-of-date type; has a constant air inlet orifice at the gasoline spraying jet, a float feed and an auto extra air inlet valve, but no device such as rising air valves in the main air entry and no taper needle in the jet. It is four-cycle, and a two-cylinder, so that rapid acceleration is advisable on engaging the clutch. It differs from the conventional four-cylinder motor in this respect. Modern devices will improve results, but their introduction here would considerably complicate causes and involve effects.

Fig. 13 therefore represents an engine without throttle control and running on a steady load. The clutch is disengaged as indicated by the curve, and on re-engaging the clutch a starting effort is exerted, after which it tends to accelerate. It races, but is slowed up by the clutch. The compression temperature rises with the speed, the extra heat generated by the increased compression enables the air better to hold up vapor and gives more power for generating additional vapor from fine spray. The spray character improves rapidly and greatly with increase of piston speed; as a result of this improvement, plus the higher piston velocity, the wall action decreases. All conditions are reversed on engaging the clutch, but as the engine picks up, so again the internal cylinder conditions increasingly favor good combustion.

#### Results of Clutch Action.

Under the arrangements assumed and having a satisfactory state of things before disengaging the clutch, visible exhaust may be anticipated both before and after use of the clutch. If the feed were wet, that is, if much spray were carried into the cylinders before disengaging the clutch, although the increased piston velocity greatly favors good combustion, the rhythmic harmony of engine action becomes disturbed. The mixture before assumed satisfactory, alters for reasons long accredited by gasoline carburetor designers, but also, in the case of heavy fuel, because the rise in compression temperature alters the value of the coefficient for internal vaporization. Modern devices can ameliorate the evils considerably, but the trouble upon engaging the clutch is more pronounced for, on top of the disorganization from racing, comes that attendant upon rapidly falling piston velocity. Here smoky exhaust may be expected since, for one thing, wall action—internal condensation, in other words—persists in its effect; so that a badly smoking engine exhaust pipe is probable at the lowest engine speed that will only gradually clear as the speed increases and a regular load comes upon the engine.

If, immediately after a change of gears, the clutch is disengaged and engaged a second time, the effects are magnified. The disturbance to engine action is compounded, the effects following the second change being the sum of the two changes. Such a condition of affairs is indicated in the diagram at Fig. 14, which assumes an unthrottled engine on a motor vehicle in such circumstances that an appreciable starting effort is made, and where a heavy car is brought to a standstill and restarts on engaging the clutch.

Sufficient time after the first change has not elapsed to recover rhythmic running, and inferior acceleration may be expected in the second change for, besides the general disorder, the persistence of internal condensation effects are superadded; that is, wall action increases. Bad exhaust conditions are to be anticipated following the second change.

Fig. 15 represents two slow, clumsily performed disengagements of the clutch on the level, with an unthrottled racing engine, the car being under way, and much the same effects result. If the curve G be added, the vaporizer temperature, if the vaporizer walls be sensitive, and H, the amount of fuel sprayed, the one increases by value of the heat cast out of the racing engine, and the other by reason of the negative pressure above the jet, while the spray character improves considerably on the increase of piston velocity. Each condition would favor oil engine combustion were the spraying constant in character and amount, but under the conditions supposed, these upset mixture, both as to quality and quantity, so that exhaust results attending the previous example may be expected.

#### Effect of Steadily Increasing Load.

Diagram Fig. 16 represents a car climbing a steadily increasing gradient, the gear lowered in two changes, and an unthrottled engine that races on disengaging the clutch. The resistance against which the engine works increases before the change and the speed falls before each change. All conditions become worse as the speed

Fig. 17—Conditions Imposed by Use of Throttle Control, Preventing Racing of Engine.

falls and prior to the changes knocking is not unlikely. The amount of heat going to the water jacket increases with the load, and the action increases with the fall of speed. Bad exhaust is certain on gear changing and im-

mediately preceding it, for the work approaches a real overload and all conditions are at their worst. Should the engine become overheated its action would be disorganized completely. All factors favor pre-ignition be-

Fig. 18—Motor with Even Load, Throttled at T and Opened up at O, the Situation Indicating Throttle Control for Speed.

fore the gear is changed, all conditions bringing about a state of engine charge characterized by the presence of liquid fuel in place of suitably combustible vapor. Racing an engine under these conditions greatly improves the condition of things within the cylinder. The isolated ordinate indicates the change from harmonious, constant load condition.

The act of throttling the assumed engine introduces new conditions. Fig. 17 indicates the engine relieved from load and prevented from racing by a throttle. The load increases to a critical amount, the heat of compression drops away instantly on closing the throttle; the curve on internal vaporization consequently follows; the spray character degenerates, and the wall action has been shown as increasing, not by reason of the lowered compression which may be rather expected to act the other way, but because the feed becomes coarse; all conditions act against the engine, tend to upset proportion of mixture, introduce spray into the charge, and may be expected to cause smoky exhaust. The condition would appear to be remedied by the opening of the throttle, but wall action—condensation—will have acted prejudicially.

#### Action Resultant on Throttling.

Fig. 18 is indicative of an engine on an even load, throttled at T and opened up at O. The situation indicated is throttle control for speed. The piston speed falls and maintains its lower limit until the charge is again admitted freely. It might be imagined that the opening of the valve would re-establish former conditions. It will, however, be noticed that this is not so. The curve C is a certain level at P, but it is lower at M. If the preceding condition were re-established these points would be on the same abscissa. The curve is the temperature of compression and is correlated necessarily to the internal combustion factor. It falls suddenly at the closing of the throttle, but, since this affects speed, as this lessens, the compression temperature is further reduced until it falls to that corresponding to the temperature associated with the speed during throttled running. The opening of the throttle, therefore, is at lowest compression temperature and lowest speed. Bearing this in mind, and that all conditions during throttling are adverse, even neglecting the mixture charge—its altered proportion of fuel and air—some information is obtained respecting kerosene engine acceleration, or want of such, and need not express less surprise that, whereas it was desired to accelerate as the dotted line B in Fig. 18, in practice it will be more as indicated by the curve B. The same conditions apply in gasoline engines, but the acceleration of these is satisfactory because gasoline is volatile and non-sensitive to the inconstancy of compression temperature; it readily turns into vapor, which holds up in the cylinder in spite of the reduced heat in the air.

No doubt the same effects pertain, in their degree, and where superfine inquiry has been applied to such engine carburetor investigations and design, perhaps many of the resultant conclusions would require modification if the point respecting compression heat were duly considered. In heavy fuel engines for variable speed duty rapid acceleration is a desideratum. It can only be obtained

by more refined carburetion, and this can only result from improving spray quality.

#### Variation in Compression Temperature.

Considering the diagrams in general, it will appear that a variation in compression temperature is a formidable evil where a condensible fuel is employed. In Fig. 19 are four diagrammatic compression lines. A represents full volumetric efficiency as the result of a wide open throttle valve; B, the condition attending partial closing of the throttle; C, half throttle, and D, a maximum of throttling. It might be said that the lines O A, O B, O C and O D represent proportionate amounts of fuel in a fit state for combustion; not that which may be burned in some sort of fashion, but that which is in a state suitable for and including perfect oxidation. If a very gross feed is assumed—a wet vapor characterized by heavy spray—as contradistinguished from that which is fine by reason of effective pulverization and complete external vaporization in the vaporizer proper, these varied heats of compression must greatly alter the quality of the explosive charge, although the amount of combustible entering the engine on intake stroke is correctly measured and constant. The total amount of combustible, in a fit state for combustion, present in the cylinder at the time of ignition, will be that resulting from the effect of adiabatic air compression plus external vaporization. It will be the sum of the combined work of the two agencies. Refinements in fuel pulverizing devices must greatly lessen the trouble here indicated, where both agents are liable to variable efficiency, for, given more constancy in the spray character and that character of a high class, a lower compression heat will suffice to complete vaporization while a higher heat will not greatly disturb actual and suitable internal conditions.

#### Defects of Throttle Control.

Assume that the card is taken from a light running engine at high speed at A, and a lower speed at B, as the piston speed falls with a coarse feed an increase of smoke in the exhaust may be expected, to a maximum of such as compression D. Moreover, assuming the feed correctly proportioned at A, and the throttle producing state D, the mixture will be greatly impoverished and the engine prone to misfire. This is but part of the trouble. If the velocity of the air past the spraying jet has decreased, contemporary with the falling in compression temperature, the spray will degenerate in character, and such a condition, under heavy load, may be followed by cessation of engine action. Again, if compression B obtains a result of internal and exterior vaporizer action, a correct proportion of air to a perfectly prepared combustible, A will see an excess, C, a deficiency. Throttle control, then, disorganizes at least three ways. It upsets mixture, as is by this time well known; it alters the character of the mixture, and alters the amount of read-

Fig. 19—Diagrammatic Compression Lines Representing Various Positions of the Throttle Valve from Maximum to Practically Closed.

ily combustible fuel present in the cylinder at the firing point.

Furthermore, taking the state of the compression line B, and regular running, the deposition of condensed

fuel upon the cylinder walls is constant; so much will be deposited on the intake and compression strokes, so much, possibly, regenerated, as vapor on the firing and exhaust strokes, but this rhythmic action is all destroyed immediately the position of the throttle is varied. Regular combustion is upset, and visible exhaust is the evidence. The factors, therefore, influencing combustion are: First, the amount of fuel sprayed; second, the character of the spray; third, the temperature of the vaporizer; fourth, the temperature of compression; fifth, the internal condensation, and six, the same factor reacting with cold walls.

These several conditions throw some light on the causes of difficulty in maintaining a clear exhaust in variable speed oil engines, where, as in engaging and disengaging the clutch, and gear changing, throttle control is varied, or the engine uncontrolled races. And, as respecting heat of compression, it should be duly noted how the variable factor concerns not only compression under each definite charge constant, but also under each such charge volume compressed at varying speed. The amount of combustible, therefore, varies differently in two orders, which, in combination, make a practically infinite variation in the quality of the explosive charge.

#### Thermodynamic Losses.

Not only does the actual amount of the combustible vary as stated, but the variation in the mixture as externally prepared and supplied to the cylinder varies the compression curve. It has been long known that the temperature attained by the sudden compression of pure air considerably exceeds that of a mixture of gasoline, air and combustible products. The lowering of the curve is a measure of the work done upon liquids and vapors, and, so far as concerns vaporization, is a duty that ought to be accomplished outside the cylinder. The gas engine is a model for other internal combustion prime movers. The nearer the gasoline and the petroleum engine attains to the prototype the more perfect necessarily becomes the action. Waste heat, unavoidable under any known, practical cycle, should be employed to furnish latent heat and to vaporize. The lowered compression curve is thermodynamic loss.

(To Be Continued.)

## DRASTIC LEGISLATION PROPOSED.

### National Automobile Association Learns of Steps to Be Taken.

The National Automobile Association, with headquarters at 6 Beacon street, Boston, Mass., is decidedly active in the promotion of all matters of interest to motorists in general, and its members in particular. In a recent notice to members it announced that special arrangements had been made with the Beacon Auto Supply Company, 698 Washington street, Brookline, Mass., to vulcanize members' tires and tubes, these to be sent to the office of the association or at the quarters of the Pathfinder Automobile Company, 1112 Boylston street, Boston, Mass. Another important notice, which will prove of general interest to motorists, reads as follows:

Owing to the rapidly increasing number of deaths and injuries to persons and property, due to accidents in which motor vehicles are involved, a new association has been formed to prosecute motorists. It is reported it will undertake not only to prosecute the motorists, but will endeavor to procure from the forthcoming session of the legislature drastic automobile legislation.

This organization is reported to be in favor of fines ranging from \$500 to \$1000 for the first offense of over-speeding, and imprisonment for six months for subsequent breaches of the law. Declarations such as these have aroused considerable interest among municipal authorities, and it is evident, from their statements, as well

as from the police of a number of cities and towns, that the automobile laws of the commonwealth may be radically amended, but in any event will be very strictly enforced during the coming year.

The National Automobile Association is as much opposed to drunken, reckless or unreasonable operators of automobiles as is this new association, or any right-minded citizen; and has frequently, since its organization, sought and secured the revocation of the licenses of improper and unfit automobile operators. With these operators the association has no sympathy whatever. On the other hand, the owners of automobiles in Massachusetts are increasing at an enormous rate, and it is estimated that during the past year their owners have contributed about \$2,000,000 to the state, its cities and towns. For these and other reasons, therefore, they are entitled to certain, if not very favorable consideration.

In order, therefore, that there should not be enacted such drastic legislation as has been intimated, or other radical legislation, it behooves members of the National Automobile Association to stand firmly for their rights and to assist in increasing the size and prestige of the association by urging their friends to co-operate and support the organization in its undertaking to secure a "square deal" not only from the legislation, but from state, city and town authorities as well. Will you have the kindness to recommend or suggest some person for membership in the association, in order that we may double its number during the coming year?

## RESULTS ARE IMPORTANT.

### George M. Dickson Gives National Dealers Something to Think About.

George M. Dickson, general manager of the National Motor Vehicle Company, Indianapolis, Ind., believes that the men who sell automobiles have fallen into a wrong habit in seeking to impress the public with the value of a given car. Recently, when asked to give his ideas concerning the proper method of judging a car, he answered with the one word "Results." He says:

It is a mistake to talk too much "parts" to the automobile buyer. The piano man does not spend all his time telling you he has certain kinds of strings, a certain pedal, a certain kind of wood, etc. He impresses you with the beautiful appearance of the piano. He charms you with the tone of the instrument. He delights you with its easy touch and creates a desire upon your part to possess that particular piano because of its quality, beauty, reliability and the reputation of its builders. In short, you buy that piano because of its results, not because of its individual parts.

Apply this to the automobile. Impress the owner that he should buy the car because of results—what it will do; how well it will perform, and not because of a bolt or a screw; not because of an accessory or specifications. Car owners today want service; reliable, continuous service, without worry or trouble. They want comfort and ease, accompanied by stately appearance. They want a whole car—and not parts.

Without considering the foreign connections covered by London and Toronto, the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, has representatives in the following countries: Cuba, Porto Rico, Jamaica, Barbados, Trinidad, Republic of Panama, Ancon in the canal zone, Philippine Islands, Hawaii, Brazil and Uruguay. The company suggests that as a result of this foreign representation tourists should secure Goodyear tires without difficulty.

## IN THE COMMERCIAL VEHICLE FIELD.

### Features of the New Two-Ton, Worm Driven Truck Brought Out by the Pierce-Arrow Motor Car Company—Some Recent Installations of Merit.

**H**AVING demonstrated to its satisfaction that the principle of the worm drive as applied to its five-ton model is correct, from the viewpoint of both its engineers and its sales force, the Pierce-Arrow Motor Car Company, Buffalo, N. Y., has brought out a new two-ton worm driven truck chassis. The smaller machine is designed to meet the requirements of those who desire a lighter, dependable vehicle.

The motor does not differ essentially from

The clutch is a standard leather faced cone member, and between this and the three-speed transmission gearset is a double universal joint. The drive from the gearset is by shaft, with a universal joint at either end, and worm to a gear wheel with which is incorporated a spur gear differential. The rear axle is enclosed in a steel housing and is of the full floating type.

The chassis frame is a channel section, pressed from special steel and heat treated. It is 34 inches

wide, and is mounted on extra long semi-elliptic springs. The overall length of the chassis is 18 feet six inches, and the width 66 inches. The wheelbase is 150 inches. With a standard body the loading space is 10 feet six inches length by 72 inches width, and the total load, including the body, is given as 5200 pounds.

A feature of the construction is to be found in the fact that throughout the chassis, unusual care has been taken to minimize the attention to oiling and greasing, and so far as is possible, grease cups have been eliminated, a special type

of self-lubricating bearing being used. All bearing are liberal in size.

#### WHITE EMERGENCY WAGON.

**Street Railway Company Has a Maintenance Expense of 27.73 Cents a Mile.**

The Union Street Railway Company, New Bedford, Mass., has in service a three-ton White

**General View of the Chassis of the New Pierce-Arrow Worm Driven Two-Ton Truck.**

that utilized in the larger chassis, except in its size. It is a four-cylinder, four-cycle, water-cooled, T head unit, with bore of four inches and stroke of 5.5, giving a rating of 25.6 under the S. A. E. formula. It is stated to develop 30 horsepower at 1000 revolutions and is governed automatically at 1050. The cylinders are cast in pairs. Lubrication is by rotary pump. Ignition is by Bosch high-tension magneto. The carburetor is the firm's own make, and is of the automatic type.

truck, made by the White Company, Cleveland, O., with which it is extremely well satisfied. The general superintendent of the company, Elton S. Wilde, has caused very accurate record to be kept of the expense of the machine, with the result that it is found that during its first year it was operated a total of 7953 miles at a maintenance cost of 27.73 cents a mile.

The machine is utilized as an emergency wagon, and as such is called upon to undertake a large number of varied tasks. Mr. Wilde states it would be somewhat less difficult to enumerate the work it is not called upon to do. It was purchased primarily for hauling material in construction work, but it is available for duty at all hours of the day or night. Sometimes it is in charge of one man. At other times it is hurrying over the road at its best speed with 15 or 18 section hands and a load of poles or wires to mend a break in the line. It has served as a tow-er wagon. It has transported exhibits, etc., in promoting an outing park in the suburbs of the city. It is at the beck and call of the entire system, so to speak.

The record of expenses that has been kept is extremely accurate. For instance, on one occasion the truck was called upon to tow another machine to a local garage. Mr. Wilde is able to tell exactly what that piece of work cost his company. The truck was placed in service March 1, 1912, and the figures submitted herewith were compiled to Feb. 28, 1913. The only item that seems to need additional explanation is

Annual maintenance account of White three-ton truck in service with Union Street Railway Company, New Bedford, Mass.\*

|                            | Mile            | Total            |

\*Cost a mile taken from company's books; totals carried out on basis of 7598 miles actually travelled.

that of "Top." The machine was purchased without a top over the driver's seat, and it was decided later to add this comfort.

### SAVING TWO DOLLARS A DAY.

Two Knox-Martin Tractors Will Soon Pay for Themselves in Mt. Vernon, N. Y.

One of the first Knox-Martin tractors made by the Knox Automobile Company, Springfield, Mass., was installed with the fire department in that city on a contract under the terms of which the city was to have a full year in which to test its economy and efficiency. The machine was attached to a water tower, which had proven too heavy for horse, and which, for this reason, was not kept in active service. Before the year was

White Three-Ton Truck Transporting Rails for New Bedford Street Railway.

up the city had purchased the vehicle, it having been demonstrated in one fire alone that it was advisable to have the water tower in constant service, and that the tractor was the proper means of propelling it. The city has now purchased a second vehicle of the same maker, for use with one of its hook and ladder trucks.

Herewith are presented two pieces of apparatus owned by the fire department in Mt. Vernon, N. Y., one a steam fire engine and the other a large hook and ladder truck. The latter has a double equipment of ladders and therefore presented a problem somewhat similar to that of Springfield's water tower, in that it was found exceedingly heavy for horses. The purchase of the two Knox-Martin tractors made necessary but very little rebuilding in order to make this

**Two Knox-Martin Tractors Attached to Fire Apparatus in Mt. Vernon, N. Y.**

portion of the department motor driven.

When the horses were employed the maintenance cost of the two pieces figured at \$72 a month. Motor driven, the expense has been less than \$2 a month each. This leaves a balance of \$68 a month, or a little better than \$2 a day, in favor of the Knox-Martin tractors. And, of course, the limited cost of converting the two pieces was an item of no small consequence in considering the proposition in the first place.

#### **COLD STORAGE BAKER TRUCK.**

##### **Electric Machine with Special Body for Porto Rican Ice Company.**

The Porto Rico Ice Company at Hielo, P. R., has recently purchased and placed in service a three-ton Baker electric truck, made by the Baker Motor Vehicle Company, Cleveland, O., the body for which was specially constructed to meet the demands of the business. The company has a plant where ice is produced by mechanical methods, and this must be transported to a substation some six miles distant. The design of the body was with a view to handling the prod-

uct with a minimum loss.

The front, sides and walls are double, four inches thick, with the spaces packed with ground cork. The floor is 4.5 inches thick and it is built of one-inch oak, under which is a 1.75-inch layer of asphalt composition, and below this is a layer of one-inch cork board laid on Georgia pine board .75 inches thick. The rear is

closed by double doors and a high tail gate, these being of standard refrigerator construction, with double walls and packed with cork. Any one or all of these may be opened to load or unload the truck. Near the rear of the body may be seen the drainage outlets, which are trapped so that warm air will not be admitted, and when the doors are closed the interior is as tightly sealed as is a refrigerator or an ice box.

Within the body is a series of adjustable crossbars, by which the ice may be held in place, so that it will not shift in transit. Back of the driver's seat is a ticket box in which may be deposited the tickets received for the sale of ice, since the driver is not permitted to handle the money, and the customers pay with coupons that are purchased from the company. It will be seen that the vehicle is available for delivery as well as

**Baker Electric Truck with Specially Built Body for Transporting Ice.**

transportation from the manufacturing plant to the sub-station.

### BROWN FUNERAL CAR.

#### Indiana Manufacturer Finds Demand for This Product Is Increasing.

Something like a year ago, at the annual convention of funeral directors in the Middle West, action was taken looking toward a more general adoption of the motor vehicle. At that time the delegates to the convention were not prepared to state definitely that motor driven hearses would entirely supersede those drawn by horses, but it was the consensus of opinion that it was wise to give the subject deliberate consideration. Of course, motor driven casket wagons have been in service in all sections of the country for some time.

An accompanying illustration presents a funeral car—a name which appears to have entirely superseded the older term with the appearance of the newer type of vehicle—made by the Brown Commercial Car Company, Peru, Ind., for A. Geissel & Sons, a funeral director in Philadelphia. The chassis is standard, but it will be noted that it is mounted on pneumatic tires, and other provisions made for easy riding qualities. The appointments are quite as ornate as with the horse drawn vehicle, and in every respect there appears to have been a careful consideration by the designer of the use to which it will be put.

This car took part in the recent motor truck parade in Philadelphia and attracted much favorable comment. Will H. Brown, president of the company, who recently returned to the factory from a visit to New York City, announces that he has orders on hand for several of these vehicles for delivery in the East.

The ninth annual Omaha automobile show will be held Feb. 22-27, under the management of Clark G. Powell, as in the past.

### BOSCH AT FIRE EXHIBIT.

#### This Type of Ignition Well Represented at Recent Convention in New York City.

Manufacturers of ignition apparatus are very much interested in noting the number of vehicles utilizing their equipment in the more important exhibitions and events throughout the year. The Bosch Magneto Company, New York City, made a thorough canvas of the fire apparatus on display in the Grand Central Palace in connection with the recent convention of the International Association of Fire Engineers.

It reports that 29 of the 30 pieces of apparatus shown were Bosch equipped, giving a percentage of 96.6. At the 12-hour test held on the

Brown Funeral Car Recently Delivered to an Undertaking Concern in Philadelphia.

Hudson river pier, 11 pieces started, while but seven finished. Of the seven, the company finds that all used Bosch magnetos and five used Bosch plugs.

A battery of automobiles equipped with Goodyear tires, made by the Goodyear Tire & Rubber Company, Akron, O., recently started on a tour of the western army posts under command of Col. R. P. Davidson. Each car was equipped with machine guns and wireless outfits. They travelled on parallel roads and communicated by wireless. The different squads met at principal points along the route, varying from five to seven miles. Col. Davidson was assisted by two United States army officers who were detailed by the War Department to accompany the delegation of wireless operators.

## THE REPAIR SHOP AND THE GARAGE.

### Suggestions for Removing and Replacing Anti-Friction Bearings of the Ball Bearing Type—Tools Facilitating the Work.

**M**ANY anti-friction bearings are damaged in the removal or during application when repairing mechanism in which they are mounted,

Fig. 1—Modified Form of Wheel Puller Having Two Arms and Cross Beam for Displacing a Bearing Cone.

but this results more from ignorance of their nature than deliberate intent to damage them, according to the New Departure Manufacturing Company in its ball bearing manual issued recently. A common cause of bearing failure is noted when they are driven in place by blows from an ordinary machinist's hammer applied directly to the bearing face or through the medium of a steel drift or blunt cold chisel. Ball bearings should never be driven in place or removed by the use of steel or other hard metal tools because the race members may be permanently sprung or deformed by this treatment.

Wherever the construction permits, bearings should be removed by direct application of pressure to the part that is tightly fitted. When a bearing is mounted in a wheel hub, as indicated at Fig. 2, a simple form of wheel puller can be employed to advantage. This is a substantial casting of malleable iron or bronze made approximately the same shape as the hub cap, threaded inside to fit the hub and having a substantial set screw at least .75 inch in diameter passing through the threaded boss at the centre. The screw should be long enough to pull the wheel and bearing entirely off the spindle or axle tube. A shouldered plug of steel with a depression drilled therein to locate the screw point may be pushed in the hollow tube to centralize the screw

pressure. In use, the wheel puller casting or wheel is kept from turning and, as the screw advances, it pulls off the wheel and the bearing it contains.

A modified form of puller having two arms and a cross beam that can be used when a bearing cone must be removed from an axle or spindle is shown at Fig. 1. An attachment to permit it to remove a bearing of the unit type, such as a single or double-row annular, without exerting any pressure on the balls or outer race is clearly depicted at Fig. 3. This consists of a split casting adapted to be clamped loosely around the shaft back of the bearing inner race and any pressure exerted to remove the bearing is applied directly against the member which is a force fit on the shaft. When any form of hub or bearing puller fails to start the member to which it is applied by direct pull, its action may be accelerated after the screw has been tightened sufficiently to place the parts under a certain initial tension by a few sharp, well directed hammer blows on the beam or main body of the device. In all cases, where possible, the pressure applied to remove a bearing or part should be exerted directly against the portion that is a tight fit on the shaft or in the housing. In most cases it is the inner member of

Fig. 2—Hub Wheel Puller for Removing Wheel and Bearing from Shaft or Axle Tube.

the bearing that is a force or press fit on the shaft; the outer member is usually a push fit in the housing and may be removed easily.

If it is necessary to force the bearing off with a series of blows, always use a brass or hard babbitt metal bar or drift, or even a piece of hard maple, hemlock or oak. Do not direct all the blows at any one point on the bearing as this tends to cramp it and will make it harder to drive off. Distribute them evenly around the entire circumference, always having successive blows at points diametrically opposite.

When driving bearings in place, it is always best to use some form of soft metal yoke member as shown at Fig. 4. or a tubular section piece as indicated at Fig. 5. With either the yoke or the other tubular form, the hammer blows are distributed evenly and the bearing is driven into place without injury to either the shaft or bearing components. When a double fork member

Fig. 4—Illustrating Proper Method of Driving Bearings in Place with Yoke Member of Soft Metal.

lead is well supported, every blow of the hammer acts with telling effect and there is no rebound after the impact.

### SUGGESTS IODINE FOR CUTS.

Cut and bruised fingers are not uncommon, and owing to the dirt and oil working into these, they are difficult to heal. A repairman recommends the use of iodine instead of diluted carbolic acid, etc., stating that the former penetrates all lubricant and dirt, has a beneficial effect and causes the wound to heal more rapidly.

### GRAPHITE AFTER VALVE GRINDING.

It is said that the use of dry graphite for finishing the work of valve grinding is decidedly beneficial as a fine surface is obtained on the seat and valve proper. The graphite is utilized after the grinding is completed and the seat and valve should be wiped dry before using the material.

Fig. 5—Showing How the Blows of Hammer May Be Distributed Evenly with Tubular Tool.

Fig. 3—Construction for Removing Single or Double-Row Annular Bearings Without Exerting Stresses on the Balls.

is used, one end can be made to drive against the inner race member, while the other can be spread enough to fit the outer race if desired. Complete instructions on ball bearings are given in the manual which will be forwarded free by addressing department D of the New Departure Manufacturing Company, Bristol, Conn.

### SOFT METAL PUNCH.

In driving out shafts, etc., the ends are apt to become damaged even with the use of a copper or brass drift. The following suggestion for a drift is made by a repairman: Take a piece of weldless steel tube, 1.5 inches in diameter and nine long, and braze a wrought iron plug in one end. Next fill the tube with molten lead. It is said that it makes a most efficient punch as the

## MARTINI-HUNEKE SAFETY STORAGE SYSTEM.

A STORAGE system for handling volatile, inflammable liquids which differs from conventional practise and presents many interesting features, is the Martini & Huneke safety system marketed by the Martini & Huneke Company, Woolworth building, New York City, which concern is affiliated with a large number of companies abroad where the system has been employed for the past eight years. As the application of the system is so varied only a general outline is given herein, but installations are made to meet varying requirements whether for a manufacturing plant or a garage. The company maintains a corps of experienced engineers and is prepared to submit plans and specifications.

The most prominent features of the system are the means employed to prevent loss by evaporation, protection against fire or explosion and

to the formation of an explosive mixture.

The principle of the Martini & Huneke system is shown at Fig. 2, it comprising a storage tank of heavy sheet steel buried in the ground, inlet and outlet valves, a cylinder of compressed inert gas for protecting the liquid and for forcing it through the pipes, and jacketed pipes connecting the different parts of the system. The components shown are as follows:

1, storage tank; 2, 3, 4 and 5, anti-diffuser; 6 and 7, jacketed pipe connection to draw-off valve; 8, jacketed intake pipe; 9, carbon dioxide cylinder; 10, high pressure gas line to regulator; 11, pressure regulator; 12, low pressure gas line to storage tank; 13 and 14, jacketed draw-off valve; 15, mercury manometer; 16, liquid intake valve; 17, gas valve for equalizing pressure; 18, syphon for emptying drum; 19, shipping drum.

To charge the storage tank it is first filled with inert gas, then connected to the drum by means of a jacketed pipe and syphon. The pipes are provided with two valves, through one of which the liquid is syphoned into the storage tank, while the other permits gas from the storage tank to replace the liquid in the drum as fast as it runs out. This prevents any liquid left in the drum from coming into contact with the air and forming an explosive mixture.

The pressure of the gas in the main tank determines the height to which the liquid rises in the piping system, while the annular jacket space surrounding the distributing pipes is always in communication with the inert gas in the storage tank and assures an instantaneous return of all the liquid contained in the piping in case of any leak. In either case the liquid returns to the storage tank by gravity. As a further protection each pipe entering the tank passes through an anti-diffuser, which device serves as a safety valve, preventing the inert gas from leaving the tank and being replaced by air in the event the piping system is destroyed by fire. All of the outer pipes are fitted with fusible plugs which melt at a low temperature, insuring a return of the liquid to the tank.

To draw the liquid it is only necessary to press the lever of the discharge valve shown at the right in Fig. 1, the fuel immediately rising through the jacketed pipe, owing to the pressure of the gas, and it continues to flow until the lever is released. The jacketed pipes referred to include an inner tube having three or more longitudinal ribs to keep the walls of the two pipes apart. The anti-diffuser operates on the principle of the Davy safety lamp, its upper part being filled with wire gauze admits either liquid or the

Fig. 1—Line and Draw-Off Valve Utilized with Martini & Huneke Fuel Storage System.

manner of handling the fuel, even when the main container is being filled. Another interesting feature is that leaks are instantly noted, it being possible to verify at once the normal operation of the system.

Throughout the apparatus in which the liquid is stored or handled, air is replaced by carbon dioxide (commonly known as carbonic acid gas) or other inert gas which not only determines the movement of the liquid, but also serves as a protecting agent. This gas fills the jackets of all the pipes and valves, acting in such manner that the liquid can circulate only when the system is absolutely free of leaks. For example: If a leak occurs, the pressure of the gas will disappear and the liquid will remain in the tank where there is no danger of explosion, since air is necessary

gas, but prevents the passage of a flame into the tank. The bottom of the device is cupped to prevent diffusion of the gas in the tank after pressure has been reduced to that of the atmosphere, it being filled with liquid.

For small installations carbon dioxide gas, readily obtained, is utilized, but with large systems a special apparatus is supplied for produc-

ing an inert gas. A charging panel is also supplied containing one or more inlet valves and connections, and a receptacle for the gas cylinder is included. Special measuring apparatus can be furnished to suit requirements as with conventional fuel storage systems. The Martini & Huneke system is also constructed for tank wagons and other carriers of inflammable liquids.

### GOOD FUEL RECORD.

#### California Man Crosses Continent with Average Consumption of 15.38 Miles.

Dr. Lee C. Denning, Pasadena, Cal., believes he has created a new transcontinental record for fuel consumption, as a result of his recent arrival in New York City. He left Pasadena, May 31, taking the Midland Trail to Salt Lake City, and then the Overland Trail through Cheyenne and Omaha, thence to his former home in Oil City, Penn., after which he toured the Adirondacks region, a portion of Canada and the New England states before reaching New York City. The total distance covered was 10,238 miles, and the fuel consumption figures out at 15.38 miles to the gallon.

The car was a model 69 Overland, made by the Willys-Overland Company, Toledo, O. The road conditions presented practically every variation that could be found in the United States. The load, including passengers, camping equipment, etc., totalled about 1500 pounds. There was no serious breakage throughout the long journey, the only real accident being the fracture of one leaf of a rear spring when the car plunged into a washout in the western desert. The two front tires which left Pasadena were still on the machine when it arrived on Broadway.

### INDORSES ADAMSON BILL.

#### American Automobile Association Takes Action on Important Matters.

At the meeting of the directors of the American Automobile Association in Buffalo, N. Y., last week, Congressman Adamson's federal reg-

istration bill, the full text of which is presented elsewhere in this issue, was indorsed. Dr. H. M. Rowe, president of the Automobile Club of Maryland, and chairman of a special committee on traffic regulations, presented the first draft of uniform regulations upon which his committee has been working. Another special committee was created to look into the matter of grade crossings, of which Preston Belvin, president of the Virginia State Automobile Association, is chairman. Upon invitation, Dr. E. Stagg Whitin, executive chairman of the national committee on

Fig. 2—Components of Martini & Huneke Storage System Employing Pressure of Inert Gas and Having Many Interesting Features.

prison labor, was heard, and the directors decided to co-operate with this association in furthering the employment of prison labor in good roads construction.

At the conclusion of the meeting the board inspected a number of excellently constructed roads in the vicinity of Buffalo, these including surfaces of vitrified brick, concrete, asphalt and oiled macadam. The annual meeting will be held in Richmond, Va., Dec. 1-3. The election of officers will take place at that time and several important plans will be discussed.

## IN THE REALM OF THE MOTORCYCLIST.

### List of Exhibitors at Coliseum Show in Chicago in November--Bosch Trophy Still Remains Unawarded---Racing Results and Club News.

**T**HE committee in charge of the arrangements for the second exclusive motorcycle show in the Coliseum at Chicago, Nov. 3-8, appears to have the preparations well in hand. All the available exhibition space in the big building will be utilized to advantage, according to present indications. The decorative scheme will be simple, the various exhibition spaces being divided by ornamental pillars supporting wooden railings. The color scheme will be sage green and white. The following list of exhibitors has been made public by General Manager A. B. Coffman:

Harley-Davidson Motor Co., Milwaukee, Wis.  
 Excelsior General Supplies Co., Chicago.  
 Universal Machinery Co., Milwaukee, Wis.  
 Van Cleef Bros., Chicago.  
 Continental Rubber Works, Erie, Penn.

**Weston Kent Thomas, New Eastern District Manager, Miami Cycle & Manufacturing Company, on His Farm Near Middletown, O.**

Hawthorne Mfg. Co., Bridgeport, Conn.  
 Minneapolis Motorcycle Co., Minneapolis, Minn.  
 Excelsior Motor & Mfg. Co., Chicago.  
 Jenkins & Co., Des Moines, Ia.  
 Miami Cycle & Mfg. Co., Middletown, O.  
 E. & C. Mfg. Co., Philadelphia.  
 Purdy Bros., Chicago.  
 R. J. Leacock Sporting Goods Co., San Francisco.  
 Nathan Novelty Mfg. Co., New York City.  
 Angsten-Koch Co., Chicago.  
 Iver-Johnson Arms & Cycle Works, Fitchburg, Mass.  
 F. W. Spacke Machine Co., Indianapolis, Ind.  
 American Motor Co., Brockton, Mass.  
 Jones & Noyes, Chicago.  
 Majestic Mfg. Co., Worcester, Mass.  
 Reading-Standard Co., Reading, Penn.  
 Motor Car Equipment Co., New York City.  
 Emblem Mfg. Co., Angola, N. Y.  
 Eclipse Machine Co., Elmira, N. Y.  
 New Lite Mfg. Co., Newton, Ia.  
 Milwaukee Motorcycle Mfg. Co., Milwaukee, Wis.  
 Stewart-Warner Speedometer Corp., Chicago.

Greyhound Motor Co., Buffalo, N. Y.

 Hine-Watt Mfg. Co., Chicago.  
 Svensgaard Sales Corp., Detroit.  
 H. & F. Mesinger Mfg. Co., New York City.

#### Latest Merkel News.

Not being content with its new branch plant at Indianapolis, Ind., and the additions recently constructed in connection with the main factory at Middletown, O., the Miami Cycle & Manufacturing Company, maker of Flying Merkel machines, has started work on a new frame department at Middletown. This structure, the foundation for which was completed last week, will be of brick and will cost about \$25,000. It is expected that it will enable the company to double its daily output of both motorcycle and bicycle frames.

In order to be in a better position to supply the market in the district comprising the six New England states, it has been decided to open a direct factory branch in this territory. The branch will be located at 315 Dwight street, Springfield, Mass., and will have its official opening Oct. 1.

## PERFECT SCORE=1,000 POINTS

Indicates a great deal to the motorcycle rider, for it means that the motorcycle which can go through a gruelling endurance contest without the slightest mechanical trouble is the machine to depend on for day in and day out service.

In the 600 miles Ohio State F. A. M. grind

**THE FLYING MERKEL**

scored another triumph. Herman Sill, of Cleveland, on the 7 H. P. Merkel shown above, finished the contest with a perfect score—made every control on time and easily passed every competing machine in the contest when he met them on hills or in mud or sandy going—with the Flying Merkel you always have a perfect machine and a perfect score.

### STILL ANOTHER VICTORY

In the Detroit M. C. Annual Endurance run over 400 miles of the worst roads of the country 30 riders started—only two finished perfect. B. A. Waltz, riding the only Flying Merkel entered—finished perfect.

Waltz rode a 7 H. P. belt drive Merkel—Sill, a chain drive. Flying Merkels are furnished with either belt or chain transmission. Always Remember—

*"If it passes you, it's a Flying Merkel."*

*Did you wire for agency?*

**The Miami Cycle & Mfg. Co.**  
320 HANOVER STREET.  
MIDDLETOWN, OHIO  
MEMBER M.M.A.

When Writing to Advertisers, Please Mention The Automobile Journal.

A full line of Flying Merkel motorcycles and bicycles, Raycycles, Hudsons and jobbing bicycles will be carried. The company also has leased the

**Indian Team in Cleveland-Newark Run: A. Zimmerman, F. L. Hunt and W. J. Yeubner.**

basement of the building, affording sufficient space to carry in stock several carloads of motorcycles and bicycles at all times.

C. A. Van Doren has been appointed New England branch manager and will make his headquarters in Springfield. George Schueller, at present assistant advertising manager at the Middletown plant, will assist Mr. Van Dorn. Mr. Schueller's successor has not been named. William McKinley Sheets, who has been covering the eastern territory as assistant to the late W. K. Aurandt, has been promoted to have full charge of the Long Island and New Jersey district. His place as eastern district manager has been filled by Weston Kent Thomas, who, although his duties require the greater part of his time, still finds pleasure in devoting attention to a small farm near Middletown, O. William G. E. Tytus, formerly of the sales department of the Colin Gardner Paper Company, has resigned to become affiliated with the Flying Merkel's selling force.

#### **The Bosch Trophy.**

A particularly unfortunate result of the recent "celebration" of the 10th birthday of the Federation of American Motorcyclists in Brooklyn, N. Y., was the failure to run off the 50-mile national amateur championship race, the completion of which is necessary before the Bosch trophy, awarded annually on a point system by the Bosch Magneto Company, New York City, can be presented.

The other events in this series were held during the annual convention in Denver, at which time it was announced that the 50-mile race would be held in Brooklyn during this celebra-

tion. Later the directorate of the F. A. M. decided that a meeting could not legally be held in Brooklyn. It is difficult to understand why this should have affected the holding of the final race in the series, however, and it seems desirable that some steps should be taken to complete the series, both in justice to the competitors and to the Bosch Magneto Company, which has been a generous supporter of the motorcycle industry and the F. A. M.

As a result of the present situation, the contestants for the trophy have gained points as follows: Constant, 37; Feuerstein, 23; Attaberry, 11; Odiorn, four. The available points in connection with the 50-mile race are: First, 15; second, 10; third, eight. It will thus be seen that it would be possible for Feuerstein, for instance, to secure the award, if for any reason Constant were unable to finish the race.

#### **Arrested as Spies.**

Stanley F. Withe of Longmeadow, Mass., and Walter McKim of Brookline, Mass., recently returned from a 12,000-mile trip abroad, on which they encountered a number of adventures which were not included in the original schedule. Both boys rode Thor machines. They left Boston, June 7, shipping to Liverpool, where they set out to cross England, visiting the lake region, Stratford-on-Avon, Oxford and London, as well as many other points of interest. They then crossed the channel to Dieppe, going to Paris, Dresden, Berlin, Hamburg, Copenhagen and St. Petersburg. They returned to England by boat from

**Beginning Work on the New Frame Department of the Flying Merkel Plant, Middletown, O.**

St. Petersburg, and again crossed Great Britain to Liverpool to catch the Boston boat.

The most thrilling adventure of the trip came

just as the two young men crossed the boundary from France into Germany, in the little town of Gravelot. They were standing in the roadway with their machines lying by the roadside, when several German police officers took them into custody and hustled them before an impromptu court martial. Accused of being French spies they were locked up for the night, American friends vouching for their identity in the morning.

They were in the House of Commons when the Irish Home Rule bill came up for a vote. At another time they procured dapper little canes and presented themselves at the gates of Blenheim castle, while the Duke of Marlborough was giving a house party, and to their surprise were freely admitted. In Kidderminster, the motorcyclists caught a glimpse of King George and Queen Mary, who were then making their annual trip through that section of England.

### Recent Racing Results.

The following summaries indicate the results in various recent race meets throughout the country:

#### Quincy, Ill.

Three miles, free-for-all—First, Menhe, Indian; second, Maloney, Merkel; third, Doty, Merkel; time, 4:23.

Three miles, amateurs—First, Menhe, Indian; second, Doty, Merkel; time, 4:30.

#### Morrison, Ill.

Five miles, stock twins—First, Smith, Merkel; second, Machemer, Indian; third, Crocker, Thor; time, 6:57.

Five miles, singles—First, Hardy, Curtiss; second, Crocker, Thor; third, Brown, Harley-Davidson; time, 8:14.

Five miles, open—First, Machemer, Indian; second, Champlin, Henderson; third, Brown, Curtiss; time, 6:59.

#### Seattle, Wash.

Eight miles, professionals—First, Cogburn, Indian; second, Simmons, Excelsior; third, Rose, Excelsior; time, 7:32.5.

Twenty miles, professionals—First, Cogburn, Indian; second, Rose, Indian; third, Simmons, Excelsior; time, 19:08.5.

#### Dayton, O.

Five miles, professionals—First, Gardner, Excelsior; second, Jones, Merkel; third, Creviston, Excelsior; time, 6:17.4.

Three miles, amateurs—First, Gebhart, Thor; second, Watson, Indian; time, 5:00.

Ten miles, professionals—First, Gardner, Excelsior; second, Creviston, Excelsior; third, Birkenbach, —; time, 12:39.

Two miles, professionals—First, Gardner, Excelsior; second, Birkenbach, —; third, Wilkins, Harley-Davidson; time, 2:40.

#### Youngwood, Penn.

Five miles, amateurs—First, Martin, Indian; second, Dietz, Thor; time, not given.

Five miles, professionals—First, Schmidt, Indian; second, Beacon, Harley-Davidson; third, McCall, Indian; time, 6:24.

Ten miles, professionals—First, Beacon, Harley-Davidson; second, Roth, Thor; third, Markman, Indian; time, 13:35.

Ten miles professionals—First, Beacon, Harley-Davidson; second, Schmidt, Indian; third, Markman, Indian; time, 13:26.

Fifteen miles, professionals—First, Markman, Indian; second, Schmidt, Indian; third, Beacon, Harley-Davidson; time, 20:51.

### Club Notes, Here and There.

Members of the Taunton Motorcycle Club, Taunton, Mass., held a century run Sept. 14, the party visiting Fall River, New Bedford, Middleboro, Bridgewater, Brockton, Easton, Norton, Attleboro, Pawtucket and Providence.

Twenty-three of the 44 starters in the recent endurance run of the Rose City Motorcycle Club, Portland, Ore., to Seattle, Wash., and return, finished the event. But seven of these secured perfect scores. Those who finished and their scores follow: H. E. Meads, C. A. Hunt, C. A. Simmons, Carl Rose, Dan Boone and C. S. Hamilton, Excelsiors, and E. Bennett, Harley-Davidson, 1000; Guy Vernon, Excelsior, 999; Bert Hederly and Archie Fife, Harley-Davidsons, 996; Harry Eaton, Excelsior, 992; A. Kildahl, Eagle, 991; Victor Carlson, Harley-Davidson, 987; D. D. Hull, Indian, 974; M. C. Webster, Indian, 964; Gus Peppell, Excelsior, 953; A. Haril, Excelsior, 947; J. Schauteem, Merkel, 937; John Maier, Thor, 900; J. Eppenstien, Harley-Davidson, 888; Page Williams, Excelsior, 880; W. R. Singletray, Excelsior, 659; J. Carlson, Thor, 510.

Seventeen out of 26 starters finished the recent reliability run of the Ohio State F. A. M., from Cleveland, O., to Newark, N. J., and return, six of these having perfect scores. The results follow: Herman Sill, Merkel, 1000; C. Tunte, Harley-Davidson, 1000; F. L. Hunt and W. J. Teubner, Indians, 1000; Raymond Ray, Yale, 1000; E. Hawkins, Thor, 1000; A. Zimmerman, Indian, 997; I. F. Jacobs, Yale, 995; J. A. Campbell, Yale, 990; Walter Lawrence, Harley-Davidson, 989; E. Rischel, Pope, 986; J. M. Cargill, Merkel, 967; O. J. Oberwagner, Pope, 963; W. J. Lister, Harley-Davidson, 942; P. W. Stevens, Yale, 923; J. F. Grumbo, Excelsior, 906; Herbert Meyers, Harley-Davidson, 901.

The Providence Motorcycle Club, Providence, R. I., has issued entry blanks for its annual Triangle run, Oct. 5. The riders will leave Providence at 7 in the morning and are due to leave Boston at 10 and Worcester at 1 in the afternoon, returning to Providence at 4. The total distance is 138 miles. Special prizes will be awarded for sidecars. Entries close Oct. 2, with B. A. Swenson, 522 Broad street, Providence.

C. A. Van Dorn, Manager, New England Merkel Branch.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, supplies, etc.:

**Bellamore Toomey Company**, New York City; \$30,000; D. G. and D. R. Bellamore, Bronx; T. H. Toomey.

**Nichols Tire & Rubber Company**, New York City; \$5000; James C. Nichols, Yonkers, N. Y., and others.

**United States Pneumatic Rim & Tire Company**, Wilmington, Del.; \$1,000,000; Charles B. Bishop, Clarence J. Jacobs and others.

**Federal Auto Supply Company**, Buffalo, N. Y.; \$6000; Franklin E. Bard, Julius M. Schwert and others.

**American Motor League**, Philadelphia, Penn.; \$100,000; to manufacture and deal in cars and accessories; E. M. Wilke, John Groetch and others.

**Deatherage Airless Tire Company**, Richmond, Ky.; \$14,000; J. S. Collins, S. H. Deatherage and others.

**Cincinnati Velle Motor Sales Company**, Cincinnati, O.; \$5000; John J. Fauth, Elmer Strategies, J. J. Grogan.

**Edwardsville Garage & Auto Supply Company**, Edwardsville, Ill.; \$10,000; Thomas J. Fahnestock, Olin H. Glese, Walter Kriege.

**Commercial Auto Body Company**, New York City; \$12,000; to manufacture wagons and motor trucks; William

\$25,000; to sell automobile engine testers, etc.; R. Corin and I. M. Cohen, New York City; S. Mirbach, Mt. Vernon, N. Y.

**Reeves Garage & Motor Company**, Camden, N. J.; \$100,000; general automobile business; W. Lippincott, Haddon Heights; C. M. Reeves, Camden; A. Moulton McNutt, Collinswood.

**Motor Shop**, Trenton, N. J.; \$25,000; Robert C. Manning and others; 640 East State street.

**S. & M. Motor Company**, Detroit; \$10,000; to manufacture S. & M. car.

**McDonald Motor Car Company**, Milwaukee, Wis.; \$10,000.

## WITH THE MANUFACTURERS.

**The Herff-Brooks Corporation**, Indianapolis, Ind., sole distributor for Marathon cars, has appointed the following salesmen: South, F. E. Wilson, headquarters, Dallas, Tex.; New England, F. C. Carter; Atlantic Coast, Paul Morford. E. L. Hansel is added to the local retail staff.

**Charles E. Giltner**, director of sales for the Velle Motor Vehicle Company, Moline, Ill., is authority for the statement that the sale of Velle pleasure cars and trucks for the past year showed an increase of 117 per cent. over that of the previous year.

**Richard E. Baus**, a former Studebaker manufacturing expert, who has more recently been in charge of the Maxwell plant at Dayton, O., has rejoined the staff of the Studebaker Corporation, Detroit, as assistant to Production Manager Max Wollerling.

**W. A. McDermid**, sales manager of the Service Recorder Company, Cleveland, O., announces the appointment of the Atlas Commercial Company of Ponce and San Juan, P. R., as Porto Rican representative for the sale of the Service recorder. The company is now represented by

factory branches in the following cities: Boston, New York, Philadelphia, Baltimore, Washington, Atlanta, Buffalo, Pittsburg, Cleveland, Cincinnati, Indianapolis, Detroit, Chicago, St. Louis and Kansas City, and on the Pacific Coast by the Geo. F. Eberhard Company, with offices in San Francisco, Seattle and Portland.

**Conrad Von Meyenburg**, director of motoculture in Basle, Switzerland, was a recent visitor of manufacturers in Detroit, in search of motor traction engines.

**The Southern Tire & Rubber Company**, Augusta, Ga., has elected the following officers: President, Weems A. Smith; vice president, H. S. Dunbar; secretary-treasurer, James P. Armstrong. It is announced that the company will locate a factory in that city in the very near future.

**L. M. Bradley**, well known in the industry through his connections with the old United States Motor Company, and more recently with the Willlys-Overland Company, Toledo, O., has been appointed assistant sales manager of the Moline Automobile Company, East Moline, Ill., which has secured a license to manufacture cars fitted with the Knight sleeve valve motor.

**John W. Eisenhouth**, Alameda, Cal., has purchased 1000 acres near Dumbarton point, San Mateo county, and it is understood that a portion of it will be utilized as a site for a factory for the production of automobile engines.

**William J. Benson**, San Jose, Cal., acting for a syndicate of business men, has purchased the Victory Motor Car Company's works at South First street, and it is announced that the plant will be devoted to the production of traction engines.

**Public Service Station of the Hartford Electric Light Company, Hartford, Conn.**

Hertz, Casper A. Schelper, Arthur W. Owen., 208 West 69th street.

**Carolina Motor Company**, Statesville, N. C.; \$25,000; H. H. Yount, S. B. Miller, J. M. Deaton.

**American Motor Transit**, Camden, N. J.; \$100,000; L. J. Bergdoll, F. R. Hansell, F. S. Garman.

**Baldwin Auto Garage**, Rutherford, N. J.; \$100,000; D. N. Knoller and M. Cohen, Newark; A. Ely, Jr., Rutherford.

**Times Square Automobile Company**, Chicago; \$150,000; to manufacture and deal in automobiles and accessories.

**Auto Cover & Supply Company**, Richmond, Va.; \$15,000; to manufacture and sell automobiles, etc.

**Mann Motor Car Company**, Pine Bluff, Ark.; \$10,000; to deal in automobiles.

**Harper's Motor Sales Company**, Charlotte, N. C.; \$25,000; W. J. Crowell, J. A. Rose, C. H. Gorman.

**Chester Rubber Tire & Tube Company**, East Liverpool, O.; \$250,000; president, John E. Newell; vice president, George A. Hasson; James C. Freshwater, George Arner.

**Potsche Storage Battery Company**, Chicago; \$75,000; to deal in batteries, electric and automobile supplies, etc.; J. N. Lucas, A. S. Coon and others.

**Los Angeles Cyclecar Company**, Los Angeles, Cal.; \$10,000; W. S. Bohannon and others.

**Grady Roueche Motor Company**, Salt Lake City, Utah; \$10,000; president, F. W. Roueche.

**Haynes Motor Sales Company**, Charlotte, N. C.; \$25,000.

**Oleson-Adams Manufacturing Company**, Detroit; \$10,000; to manufacture automobiles.

**Automobile Engine Tester Company**, New York City;

**Unexcelled American Genius  
Unexcelled American Skill  
Unexcelled American Manufacturing Processes**

have produced the Unexcelled, American-made, New Departure ball bearing—the bearing that has proved its superiority by actual service in 80 per cent. of American-made motor cars.

**Three Types:**

**Double Row**—A two-purpose bearing of maximum capacity for both radial and thrust loads.

**Single Row**—For radial loads only. An improved separator is an advantageous feature.

**Radax**—High grade cup-and-cone type bearing for sustaining radial loads and one-direction thrusts.

Descriptive catalog will be sent on request.

Engineering consultation service at your command. Send us your blueprints, speed and load data and we will tell you what size and type of bearing will best do your work with greatest efficiency and least friction and wear.

"Elimination of Friction" brochure, now in third edition, discusses the relative merits of balls and rollers in bearing work. A copy will be sent you free on request.

**The New Departure Mfg. Co.**

Department D      Bristol, Conn.  
WESTERN BRANCH: 1016-17 Ford Bldg., Detroit, Mich.

"New Departure Ball Bearing Manual" full of information for the garage man and dealer, just off the press. The only book of its kind. Ask us for it.

Special data sheets on New Departure Self-Aligning Shaft Hangings and use of New Departure Ball Bearings in machine tools sent free on request. Address New Departure Mfg. Co., Hartford Division, Hartford, Conn., for them.

When Writing to Advertisers, Please Mention The Automobile Journal.

**R. W. Hutchinson, Jr.**, for some time past with the International Motor Company, New York City, has become publicity engineer for the commercial vehicle department of the Packard Motor Car Company, Detroit.

**The General Motors Company**, Detroit, Mich., is expected to issue a statement in the near future showing that its earnings for the last year were more than enough to yield 20 per cent. on the common stock, as against 17.44 per cent. in 1912.

**The Electric Automobile Manufacturers' Association** held its annual meeting in Cleveland, O., Sept. 16, at which the following officers were elected: President, Louis E. Burr, Woods Motor Vehicle Company; vice president, R. C. Norton, Baker Motor Vehicle Company; secretary and treasurer, F. H. Dodge, Ohio Electric Car Company; executive committee, G. D. Fairgrave, Anderson Electric Car Company; H. H. Rice, Waverley Electric Company; C. F. L. Wieber, Rauch & Lang Carriage Company.

**The F. W. Spacke Company**, Indianapolis, Ind., maker of motorcycle motors, has added a new department for the production of motors and parts specially adapted to cyclecars. F. E. Lawrence has been appointed to represent the company in Detroit.

**A. S. Robinson**, formerly sales manager of the Kissel-Kar branch in Los Angeles, Cal., has succeeded the late E. Rogers Stearns as branch manager.

**The Firestone Tire & Rubber Company**, Akron, O., maker of Firestone tires and rims, had gross earnings of \$15,000,000 during the fiscal year recently ended, as

## GARAGE AND DEALER.

**The George Grow Automobile Company**, Boston, Mass., one of the largest dealers in slightly used motor cars and trucks in New England, has removed into new and larger quarters in the five-story building known as the Electric garage, 321-323 Columbus avenue. It will occupy the entire structure as a salesroom and service station.

**Fred W. Dart**, Hartford, Conn., has secured the Oldsmobile agency for the Palace Auto Station.

**The Drummond Auto Company**, Omaha, Neb., agent for Locomobile and Woods electric pleasure cars and Chase and G. M. C. trucks, has changed hands, the new officials being: President, J. W. Griffith; vice president and general manager, F. W. Bacon; secretary and treasurer, W. L. Griffith.

**The Providence Motor Car Company**, Snow and Washington streets, Providence, R. I., agent for Maxwell and Velie cars, and Ajax tires, is issuing to the local public an interesting letter calling attention to the attractive features of the Maxwell line for 1914.

**M. J. Mitchell**, Vancouver, B. C., after a visit to the factory of the Cartercar Company, Pontiac, Mich., has organized the Cartercar British Columbia Company to handle the distribution of Cartercars in that territory. Associated with him in the enterprise is his brother, W. M. Mitchell. The salesrooms will be located at 723 View street, Victoria.

**The Gibney Tire & Rubber Company**, Boston, Mass.,

## Crown Laundry Company, Louisville, Ky., Is Only Concern of Its Kind with Completely Motorized Equipment.

compared with \$11,500,000 for the preceding year. Net profits were \$1,600,000, and the surplus, \$1,250,000. The balance sheet shows current assets of about \$7,000,000.

**The Mitchell-Lewis Motor Company**, Racine, Wis., has elected the following officers: President and general manager, Beach L. McClaren; first vice president and general factory manager, William T. Lewis; treasurer, F. L. Mitchell; secretary, H. E. Redman; general sales manager, O. C. Friend; purchasing agent, G. W. Morgan; general counsel, M. J. Gillen.

**The Motor & Manufacturing Company**, Dunkirk, N. Y., has awarded contracts for the erection of a new plant, comprising one two-story structure, 57 by 85 feet, and a one-story building, 30 by 84 feet.

**Arthur A. O'Neill** has been appointed eastern sales manager for the Empire Automobile Company, Indianapolis, Ind., and will make his headquarters in Boston, Mass.

**C. F. Brockus**, superintendent of the Studebaker plant No. 4 in Detroit, has been promoted to a new position, recently created, in which he will have to do with the specialization of manufacturing methods.

**The Edward F. Gerber Company**, Pittsburg, Penn., is understood to have made arrangements to take over the business of the Michigan Motor Car Company and the Michigan Buggy Company, Kalamazoo, Mich., which recently met with financial reverses. It is expected that the headquarters will be located in Pittsburg and that the factory in Kalamazoo will be continued as a manufacturing proposition.

will shortly open a branch establishment on Brookline street, near Beacon street.

**Hewitt & Son**, Hillsdale, Mich., has sold its garage to George Frost, Montgomery, Mich.

**The King Motor Car Company**, Detroit, has opened a branch agency at 1089 Boylston street, Boston, Mass.

**John L. Hammond**, formerly with the Eagle Oil & Supply Company, Boston, Mass., has been appointed manager of the new Boston branch of the Endurance Tire & Rubber Company, New York City.

**Russell H. Erskine** and Frederick N. Burr, Meriden, Conn., who have been operating the automobile station on East Main street in that city, have dissolved partnership. With Herbert Baldwin, Mr. Erskine will continue the business under the firm name of the Central Garage Company.

**A. C. Rose** of the automobile department of Brown, Thomson & Co., Hartford, Conn., has returned from a visit to Detroit, where he inspected many of the new 1914 models.

**Henry A. Brandtjen** has purchased the business of the St. Paul Motor Vehicle Company, 50 East Fourth street, St. Paul, Minn., and will handle the agencies for the Haynes, Lozier and Fiat cars.

**The Dayton Buick Company**, Dayton, O., has been organized with capital of \$10,000 to handle the sale of Buick cars, made by the Buick Motor Company, Flint, Mich., in northern Ohio. The officers of the new company are: President, L. J. Haughey; vice president, Joseph A. McKenney; secretary-treasurer, A. J. Smith.

## RECENT PATENTS.

**Pressure Gauge**, Harutun B. Azadian, Syracuse, N. Y., assignor to Akabl R. Azadian of the same place. No. 1,072,415. Filed May 20, 1909.

**Automobile Light Shifter**, John G. Becker, Campbell, Mo. No. 1,072,418. Filed Jan. 30, 1913.

**Float**, Ernest D. Broderick, Detroit. No. 1,072,420. Filed Aug. 23, 1911.

**Lubricant Retaining Means**, Alexander T. Brown, assignor to the Brown-Lipe Gear Company, Syracuse, N. Y. No. 1,072,421. Filed Jan. 11, 1911.

**Spring Wheel**, William T. Crawford-Frost, Baltimore, Md. No. 1,072,433. Filed Oct. 2, 1911.

**Control Lever**, William C. Durant, Detroit, assignor to the Chevrolet Motor Company of the same place. No. 1,072,438. Filed April 4, 1912.

**Tire Protector**, Silas S. Huffman and Dur A. Huffman, Youngstown, O. No. 1,072,464. Filed March 13, 1913.

**Wrench**, Frederick Newell Martindale, Spraguesville, N. Y. No. 1,072,479. Filed Dec. 21, 1912.

**Shock Absorber**, Adolph Peteler, New York City. No. 1,072,770. Filed Feb. 20, 1912.

**Gauge for Fuel Tanks**, Philip M. Bush, Hartford, Conn., assignor to the Bush Manufacturing Company of the same place. No. 1,072,819. Filed Dec. 5, 1911.

**Automatic Safety Brake**, Lee G. Eggers, Mount Lebanon, Penn., assignor to Zeffie M. Eggers of the same place. No. 1,072,841. Filed Aug. 26, 1912.

**Carburetor Mechanism**, Milton L. Sammons, Kansas City, Mo. No. 1,072,875. Filed May 29, 1913.

**Gauge for Fuel Tanks**, Edward S. Savage, Rochester, N. Y. No. 1,072,876. Filed July 31, 1912.

**Tire Support**, Louis Cadwell, New York City. No. 1,072,909. Filed March 3, 1913.

**Tire**, Ora Dimmitt, Green Castle, Mo. No. 1,072,925. Filed Feb. 5, 1912.

**Double Acting Wrench**, Robert Owen, Jr., Shawnee, O. No. 1,072,980. Filed Feb. 3, 1913.

**Vehicle Wheel**, Jorge Guerrero, Paris, France. No. 1,073,040. Filed Dec. 26, 1911.

**Spark Plug**, Edwin C. Henn, Cleveland, O. No. 1,073,048. Filed Jan. 4, 1912.

**Safety Crank**, John O. Stanley, Holyoke, Mass. No. 1,073,058. Filed Sept. 28, 1912.

## COMING EVENTS.

## September.

Sept. 26-27—Track races, Peoria, Ill.  
Sept. 26-29—Convention, State Firemen's Association, New Bedford, Mass.

Sept. 27—Track races, White Plains, N. Y.

Sept. 27—Track races, San Marcos, Tex.

Sept. 27—Track races, Kalamazoo, Mich.

Sept. 27-28—Track races, Bakersfield, Cal.

Sept. 28—Hill climb, Mont Verdun, France.

Sept. 29-Oct. 4—American Road Congress, Detroit, Mich.

## October.

Oct. 3—Track races, Trenton, N. J.

Oct. 3-4—Track races, Oklahoma City, Okla.

Oct. 4—Track meet, Fresno, Cal.

Oct. 4—Reliability tour, St. Louis, Mo.

Oct. 4-11—Around Lake Michigan tour, Chicago, Ill.

Oct. 6-18—Show, St. Louis, Mo.

Oct. 11—Track races, Springfield, Ill.

Oct. 12-17—Convention, American Institute of Metals, Chicago, Ill.

Oct. 12-17—Convention, Carriage Builders' National Association, St. Louis, Mo.

Oct. 13-18—National fire prevention conference, Philadelphia, Penn.

Oct. 15-25—Electrical Show, Grand Central Palace, New York.

Oct. 17-27—Automobile Salon, Grand Palais, France.

Oct. 18-19—Track races, St. Louis, Mo.

Oct. 24—Convention, American Iron & Steel Institute, Chicago, Ill.

Oct. 27-28—Convention, Electric Vehicle Association of America, Chicago, Ill.

## November.

Nov. 2-3—Road race, El Paso, Tex.-Phoenix, Ariz.

Nov. 3-8—Motorcycle show, Coliseum, Chicago, Ill.

Nov. 4-5—Road race, Los Angeles, Cal.-Phoenix, Ariz.

Nov. 4-5—Road race, San Diego, Cal.-Phoenix, Ariz.

Nov. 6—Track races, Phoenix, Ariz.

Nov. 8-12—Track races, Shreveport, La.

Nov. 7-15—Olympia Show, London, England.

Nov. 8-15—Show, Atlanta, Ga.

Nov. 24—Vanderbilt Cup race, Savannah, Ga.

Nov. 27—Grand Prize race, Savannah, Ga.

## December.

Dec. 1-3—Annual meeting, American Automobile Association, Richmond, Va.

Dec. 9-12—Convention, American Road Builders' Association, Philadelphia, Penn.

Dec. 10-12—Convention, Retail Implement & Vehicle Dealers' Association, Milwaukee, Wis.

Dec. 11-20—International exposition of safety and sanitation, American Museum of Safety, New York City.

## January.

Jan. 2-10—Importers' Salon, Hotel Astor, New York City.

Jan. 3-10—Pleasure car show, Grand Central Palace, New York City.

Jan. 24-31—Pleasure car show, Coliseum, Chicago, Ill.

Jan. 26-31—Show, Scranton, Penn.

Jan. 31-Feb. 7—Show, Minneapolis, Minn.

## February.

Feb. 2-7—Pleasure car show, Buffalo, N. Y.

Feb. 9-14—Truck show, Buffalo, N. Y.

Feb. 22-27—Show, Omaha, Neb.

Feb. 22-March 5—Show, Cincinnati, O.

Feb. 24-28—Show, First Regiment Armory, Newark, N. J.

## March.

March 7-14—Pleasure car show, Mechanics' Building, Boston, Mass.

March 17-21—Truck show, Mechanics' Building, Boston, Mass.

## RECENTLY ANNOUNCED 1914 MODELS.

**T**HE list of six-cylinder machines is being increased very materially in the announcements of new models now being made. Some of the latest features in design and construction are to be found in the following brief statements, which include only the more important changes, as indicated by the information made public by the manufacturers:

**National**—National Motor Vehicle Company, Indianapolis, Ind. Coupe shown in accompanying illustration, added to series V-3 as previously announced.

**Pullman**—Pullman Motor Car Company, York, Penn. Model 6-46. Remainder of the line continued. New light six-cylinder has unit power plant with bore of 3.75 inches and stroke of 5.25. Four-speed transmission with Vulcan electric gearshift. Extra long, flat front springs; three-quarter elliptic rear. Wire wheels.

**Havers**—Havers Motor Car Company, Port Huron, Mich. Two six-cylinder models, continued from last season with but few changes, except in body design. Larger car known as 6-60, has motor with five-inch bore and

Attractive Coupe Added to National Series V-3.

5.25-inch stroke, instead of four by 4.25. Elsemann magneto. North East starting and lighting system. Equipment very complete. Wire wheels optional.

**Marathon**—Marathon Motor Works, Nashville, Tenn. Distributor Herff-Brooks Corporation, Indianapolis, Ind. Champion, Winner and Runner models continued, each with touring car and roadster bodies. Improvements largely in body design. Champion and Winner equipped with electric lighting and starting. Champion motor, 4.5 by 5.125; Winner, 4.25 by 4.5; Runner, 3.5 by 4.5.

**Palge**—Palge-Detroit Motor Car Company, Detroit. Models 25 and 36 continued with changes mostly in nature of refinements. Larger chassis comes completely equipped with Gray & Davis electric starting and lighting system; smaller supplies this at an extra charge. Both have unit power plants; model 25 motor, 3.75-inch bore and four-inch stroke; model 36, four by five inches. Both are of the L head type, with cylinders cast en bloc.

**Buick**—Buick Motor Company, Flint, Mich. Model B55. Six-cylinder touring car and roadster. Supplements new four-cylinder models, and like them has left hand drive with centre control, and the Delco combination electric lighting, starting and ignition system. Motor retains characteristic Buick overhead valves, and has bore of 3.75 inches and stroke of five, being rated by the maker at 48 horsepower. All Buicks are controlled by a single lever, operating on the ball and socket joint.

**Hupmobile**—Hupp Motor Car Company, Detroit. One chassis fitted with five-passenger touring, six-passenger touring, two-passenger roadster and three-passenger inside driven coupe bodies. At option, all models are fitted with Westinghouse starting and lighting system, except the coupe, which has the starter only. With cars fitted with the starter, tires are carried at the rear. Changes largely in the nature of minor improvements. New and larger gasoline tank in cowl dash, with reserve tank built into the gasoline chamber. Magneto is provided with a rain shield.

**Speedwell**—Speedwell Motor Car Company, Dayton, O. Series H. Six-cylinder chassis with seven-passenger body. Few mechanical changes. Unit power plant. Bosch dual ignition system. Electric lighting and starting system. Left hand drive, centre control. Equipment includes: Electric horn, Warner speedometer, power air pump, Yale lock on gearshift lever, emergency gasoline supply, tire carrier of improved type, windshield integral with body, concealed tool box, and lockers under cowl. McCue wire wheels offered at an option. Either 36 by 4.5 or 37 by five-inch tires.

**Stutz**—Stutz Motor Car Company, Indianapolis, Ind. Series E. Two chassis. E 4, four-cylinder; E 6, six-cylinder; both fitted with two-passenger, six-passenger touring and coupe bodies. Motors very much alike and both fit under the same hood. Four has bore of 4.75 inches and stroke of 5.5; six is four by five, instead of 4.25 by five as with the older six. Both are of the T head type. Four cast in pairs; six, in threes. Water jacketed intake manifold. New style of breather pipe. Individual pushrod enclosure. Clutch changed from multiple disc to cone. Electric motor starter designed by Harry Stutz and built by the Remy Electric Company. Wire wheels are offered at an option. Tires, 34 by 4.5 inches all around.

**Packard**—Packard Motor Car Company, Detroit. Model 38. Two types of chassis, touring and phaeton, and 19 body styles. Changes include worm bevel gear drive, recently announced, and the following: Cylinders cast in threes. Siamese exhaust manifold with separate passage for each set of cylinders. New oiling system; all piping within crankcase and camshaft drilled to carry oil. Bosch duplex ignition system; all wiring enclosed within a compartment in unit with the water outlet manifold. Bijur electric lighting and starting system. Wheelbase increased to 140 inches. Shape of rear axle altered. Rear springs slung under axle. Brake drums increased to 17 inches diameter; brake cross shafts mounted on axle housing; brake rods within chassis. Plate clutch brake instead of band. New gearshift, eight inches further forward to allow left side entrance; new door on drive side. Tapering hood and cowl to conform. Tires carried at the rear on all models.

**Moon**—Moon Motor Car Company, St. Louis, Mo. Light six-50 Streamline. Motor differs from new model 42 four-cylinder engine in being of the L head type. Cylinders cast in threes. Bore, 3.75 inches; stroke, 5.25. Maker's rating, 58 horsepower at 1800 revolutions. Multiple disc clutch. Four speeds forward and reverse, direct drive on the third. Full floating rear axle. Wheelbase, 129; tread, 56 or 60. Tires, 35 by 4.5 inches. Weight, 3840 pounds. Delco electric light, starting and ignition system. Motor tire pump. Two types of bodies, both of the streamline design, one seating five, and the other six or seven. Also, new Moon coupe on four-cylinder chassis. Motor T head, cast in pairs, 4.5-inch bore, five-inch stroke. Three-speed transmission. Body fitted with sashless windows, extra wide driving seat and special compartment for storing spare tires.

**Davis Cyclecar**—Davis Cyclecar Company, Detroit, Mich. Special Spacke motor. Three-speed transmission. Wheelbase, 96 inches; tread, 36; weight, 600 pounds. Two passengers, seated tandem.

**DeCross Cy Car**—DeCross Cy Car Company, Cincinnati, O. Cyclecar. Motor, two-cylinder, air-cooled, 9-12 horsepower. Magneto ignition. Friction transmission. No differential. Ash frame. Wire wheels. Twenty-eight by 2.75-inch tires. Tread, 36 inches; road clearance, 10 inches.

**OPENS GALVESTON BRANCH.****H. W. Johns-Manville Company Now Has Three Offices in Lone Star State.**

Believing that the steadily increasing trade with Central and South America makes Galveston, Tex., a convenient point of distribution of its products, the H. W. Johns-Manville Company, New York City, has opened a new branch in that city. This comprises a modern brick warehouse of large proportions, and a salesroom and office for the distribution of stock in the southwest, as well as to the foreign trade.

This company is among the country's largest houses dealing in roofing, building materials, packings, pipe coverings, insulating materials and electrical goods. It owns extensive asbestos mines in Danville, Que., and has nine factories located in various cities throughout the United States. The opening of the Galveston branch makes three offices in the Lone Star State, the others being at Houston and Dallas.

**AN ELABORATE CIRCULAR.****B. F. Goodrich Company Issues Attractive Illustrated Sheet for Dealers.**

An unusually attractive and elaborate specimen of engraving and printing is noted in the circular issued recently by the B. F. Goodrich Company, Akron, O., which is being mailed to every dealer in the country. Some idea of the circular may be obtained from the dimensions, which are 42.5 by 31 inches, and the cost of the half-tone utilized on one side is said to have been \$500.

The circular was compiled to show the magnitude of the Goodrich service and advertising, and as it is unfolded, a typewritten message in letters nearly .25 inch high meets the eye with a greeting from E. C. Tibbets, the advertising manager of the company.

The illustration on the inside of the circular is a map of the United States, overlaid with reduced specimens of recent advertisements of the Goodrich company which have appeared in maga-

zines, newspapers, trade publications, etc. The location of each Goodrich branch in America is noted by a tiny tire with a black centre, upon which the name of the city is shown in white. Directly underneath the reproduction of the map, utilizing space left by the irregularity of the southern boundary and coastlines, are pictures of the Goodrich Paris factory and London branch.

The circular is printed in four colors and illustrates booklets and other co-operative methods utilized to stimulate interest on the part of dealers, etc., and is the result of the company's organization working in harmony with that of the Mahin Advertising Company of Chicago.

**INVADER OIL PROMOTIONS.****Plowman and Curtis Receive Appointments as Branch Managers.**

Following the announcement of E. A. Scheu's appointment as general manager and sales manager of the Invader Oil Company, with headquarters in New York City, considerable interest has developed in learning the name of the man who would succeed Mr. Scheu as manager of the Boston branch. The selection has fallen upon H. T. Curtis, who has been identified with the oil business for a number of years, having been associated with the old Havoline Oil Company, and later with the Wolverine Lubricants Company.

In connection with this appointment comes the information that Howard M. Plowman, who has been covering the Long Island territory for this company, has been promoted to become manager of the Philadelphia branch. Like Mr. Curtis, Mr. Plowman has seen long service with both the Havoline Oil Company and the Wolverine Lubricants Company.

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

## TRY THE M&M ECONOMIZER FOR SPEED, POWER AND ECONOMY

### HOW ABOUT THIS LETTER!

The M&M Sales Company, Lewistown, Pa.: Auburn, N. Y., August 14th, 1918.  
Gentlemen:—I am much pleased with the M&M Economizer that I put on my REO touring car a few weeks ago. I am using a carburetor, which gives a very high mileage per gallon, but with the use of your Economizer I get several more miles per gallon, thereby making a marked saving in gasoline.

It also entirely eliminates the use of brakes, except on very steep grades, which saves much wear on brakes, and I believe is a saving on tires also. It takes a few days' practice to become familiar with the use of the Economizer, but any one will be well paid for his trouble in learning to use it. I would not part with mine for several times the price and cost of installing.  
Yours very truly,  
(Signed) F. LEE RODGERS.

WHAT COULD BE MORE CONVINCING THAN THE ABOVE LETTER! ALSO, the M&M is guaranteed to do just what we claim, and if it proves unsatisfactory within thirty days, YOUR MONEY WILL BE REFUNDED. (Reference—Citizens National Bank, Lewistown, Pa.)

The M&M is guaranteed to save from 40 to 50% of gasoline, and increase the speed and power 20% with less gasoline, and less carbon. It is the only known carburetor adjuster on the market, and RANKS FIRST AS A CARBON ELIMINATOR. For priming the motor, you cannot find its equal. PLEASE BEAR IN MIND—THERE IS NO SCREEN, or any other obstacle placed in the manifold, as this will have a tendency to CLOG THE MANIFOLD, and make it more difficult for the motor to absorb the gas and air.

Price of the M&M—\$3.50 and 17c extra for postage. We include either friction foot pedal, or steering post control, which consists of flexible shaft and wire. Requires 3/4" pipe tap. Elbow will be furnished upon request.

PRICE OF THE MOTORCYCLE SIZE—\$1.25 Prepaid. Size 1/4".

THE M&M ECONOMIZER IS "THE PATENTED ONE." Warning to users, makers and dealers, PATENT NO. 922,528—May 25, 1909.

WRITE US FOR FURTHER INFORMATION AND CATALOG.

# SPLITDORF

"Always There"

The SPLITDORF "TS" TRANSFORMER—the best transformer on the market today—is a vital addition to any car, if you would have ignition snap and certainty.

YOU can have your car equipped with this new style transformer to work in connection with the SPLITDORF MAGNETO on YOUR CAR.

In its special windings a large margin of safety against electrical breakdowns is provided. In its general construction no detail has been overlooked to insure an instrument that can always be depended upon for service.

The "TS" is interchangeable with any type transformer, tube or dash coil and can be attached to any car. We will make you a very liberal allowance on your old coil in exchange for one of the new transformers.

You can also have your entire ignition system exchanged for the latest type SPLITDORF MAGNETO and TRANSFORMER at an exceptionally attractive price.

## CARBON DEPOSIT—How to reduce it

Considerable nonsense is current about carbon deposit.

Any product that will burn must be largely carbonaceous.

Lubricating oil will burn and is therefore plainly carbonaceous. Non-carbon oils cannot exist.

But the amount of carbon deposited depends on the carburetion and gasoline combustion, and on the character of the gasoline, as well as on the lubricating oil itself and its fitness for the car.

The presence or absence of carbon deposit in no way determines the lubricating efficiency of the oil.

Under identical conditions, however, some lubricating oils will give much more carbon deposit than others. This is due, in part, to three conditions:

- (1) The crude oil from which the lubricant was manufactured may have been unsuited to gas engine purposes.
- (2) The oil may have been improperly manufactured or filtered.
- (3) Its "body" may permit it to work too freely past the piston rings into the combustion chambers.

To reduce carbon deposit, it is absolutely neces-

sary to use an oil whose "body" is suited to your piston clearance.

In our chart of recommendations we specify oil of a "body" suited to the piston clearance and other lubricating conditions in each motor.

The oils themselves are scientifically manufactured from the crude bases best suited to motor car lubrication.

They are thoroughly filtered to remove free carbon and other impurities.

If you are particular about your fuel, and your carburetion and ignition, the grade of Gargoyle Mobiloil specified for your car will put an end to unnecessary carbon troubles.

A booklet, containing our complete lubricating chart and points on lubrication, will be mailed on request.

**GARGOYLE**  
  
**Mobiloil**  
A grade for each type of motor.

The various grades, refined and filtered to remove free carbon, are: Gargoyle Mobiloil "A," Gargoyle Mobiloil "B," Gargoyle Mobiloil "D," Gargoyle Mobiloil "E," Gargoyle Mobiloil "Arctic."

They are put up in 1 and 5 gallon *sealed cans*, in half-barrels and barrels. *All are branded with the Gargoyle, which is our mark of manufacture.* They can be secured from all reliable garages, automobile supply stores, and others who supply lubricants.

## The Miller Automobile Jack

The MILLER AUTOMOBILE JACK is a single acting, automatic-lowering jack, designed especially for automobile use and is adapted to the factory or garage as well as to be carried as a part of the equipment on motor cars. The MILLER JACK is constructed of the best material, no complicated or loose fitting parts to get out of order, and in material, workmanship and finish, the MILLER JACK is not exceeded, if indeed, it is equalled by any other jack. It is a high grade and one of the finest finished jacks on the market.

The short stroke makes lifting easy and rapid. Automatically locks while operating, thereby doing away with any possibility of slipping or dropping the load.

Fitted with a simple and convenient trip lever for reversing. Height, 11 inches. Raises 6 inches. Weight, 9 lbs. Capacity, 1 ton.

We guarantee this jack for 12 months, and at the price, it is the best value ever offered to the automobile trade.

We are in a position to quote a special price to manufacturers, jobbers and dealers who buy in quantities.

### CAPACITY: ONE TON.

The List Price of the MILLER JACK,  
guaranteed for twelve months.....\$3.00 each

Weight, packed for Parcel Post, 10 lbs.

When Writing to Advertisers, Please Mention The Automobile Journal.

The tendency toward all-metal construction has become an irresistible movement in all lines of building. Steel is used for the framework of buildings, bridges, etc. It provides protection against fire and elements and makes open, web-like construction possible, at the same time supplying the means of securing flexibility required by any structural work which carries a tremendous load.

In almost every means of transportation, railway coaches, steamships, automobiles, etc., where high speed is required steel construction demonstrates its superiority over wood. While the more compact construction made possible by the use of steel is desirable, its greatest benefit is the factor of safety that accrues.

Wire wheels are the last and most important wood replacement in automobile development, the last step in making the motor car what it should be, a creature of steel throughout.

McCue Wire Wheels are built along the most modern conception of wire wheel construction. Standard S spokes, made by the Standard Company of Torrington, Conn., are used. With McCue Wire Wheels the weight of the car is suspended equally from all points on the rim and the rim itself, impervious to weather, is light, thus relieving the tire of the extra pound, pound, pound which the heavy wooden rim subjects it to. Steel rims also conduct the molecular and frictional heat away from tires and prolong their life more than fifty per cent.

McCue Wire Wheels provide a factor of safety in proportion to their strength—seven times that of wooden wheels in their capacity to support loads, and fifteen times the strength of wooden wheels to resist side thrust such as comes from skidding, etc.

Write us for booklet describing the development of wire wheels, causes which brought about their use, and their superiority when compared with the ordinary artillery type wheel.

## THE McCUE COMPANY

### Buffalo, New York

## The Hand Klaxon, \$10

**THE HAND KLAXON** is not entirely new. It is a development of the original Hand Klaxon manufactured in 1909 and since then gradually discontinued owing to the large demand for motor driven Klaxons.

The Hand Klaxon operates on the Klaxon principle of a steel diaphragm set in violent vibration by a toothed wheel. In the electric Klaxon this wheel is rotated by means of an electric motor; in the Hand Klaxon by a train of gears that attain high speed under pressure on the push-rod.

The Hand Klaxon has the true Klaxon note and is sold under the regular Klaxon Guarantee of permanent satisfaction.

Klaxon quality is built into the Hand Klaxon. With the Klaxon reputation to sustain it is obvious that we cannot afford to put the Hand Klaxon on the market unless it is vastly superior to any other mechanical signal at present in use.

The price of the Hand Klaxon is \$10. Orders accepted November 1st; deliveries will begin December 1st.

# Greater than the Self-Starter!

## The Vulcan Electric Gear Shift

on the

# HAYNES

*America's First Car*

**Grab it!** Don't make the mistake of waiting until you've seen whether it makes good. It's bound to make good. It's mechanically a success. We proved that before we adopted it. It fills a bigger need than the starter. It's an improvement that has already created more interest and comment than the self-starter or any other great feature of the past.

**Dealers who sold the first self-starter cars saved hundreds of dollars in salesmanship and made a clean-up**

The self-starter put the fortunate cars which were first to use it in a class by themselves. People were wild to see the cars with the new device. They sought out the salesrooms of the local dealers and practically dropped their orders into the dealers' laps.

**Where are the dealers who said the self-starter wouldn't make good?**

When the news spread through the automobile trade, not so many months ago, that a device had been invented to start automobile engines, some dealers got busy and arranged for big orders of the improved cars. Others said: "The device may not work. We'll wait and see." They missed the great benefits which accrued to the dealers who had the sale of cars equipped with self-starters.

**This is to be an Electric Gear Shift year, like last year was an electric-starter year**  
**What are you going to do about it?**

Model 27—136-in. wheelbase, 6 cylinder, 7 passenger body. Price, \$2785

# HAYNES

*America's First Car*

with the Vulcan Electric Gear Shift is the season's big selling hit

The Haynes has always been a distinctive car—a car of great prestige and reputation—continually a leader in the adoption of fundamental improvements and betterment features. It has always been a strong car for the dealer who was awake to the selling opportunities at his command.

**The Electric Gear Shift gives Haynes dealers a great chance**

All that was true of the self-starter as a selling influence will be true in double measure of the Electric Gear Shift. This feature added to a strong selling proposition in every other way—as you'll see from the table of specifications—puts the Haynes dealer in an enviable position. There may yet be the opportunity for a Haynes dealer in your town.

***The strongest line-up of features ever embodied in a motor car***

**Motor**—Bore 4 1-4 in., Stroke 5 1-2 in. L-head Haynes. Cylinders cast in pairs. Model 26, A.L.A.M., 43.35 H. P., Dynamometer 65 H. P., Model 27, A.L.A.M., 43.35 H. P., Dynamometer 65 H. P., Model 28, A.L.A.M., 29.9 H. P., Dynamometer 48 H. P.

## Gives Ford Cars Maximum Efficiency

THE Bosch-Ford System has been designed to meet an urgent appeal for a more efficient and reliable ignition system, one that would eliminate preignition, overheating and the inherent difficulties and harmful effects of unsynchronized ignition.

The Bosch-Ford Attachment employs the Bosch Magneto and permits of this well-known system being easily adapted. The average motorist can install it and requires only the tools in the average tool-kit to do so.

Every Ford owner and all those engaged in the sale and repair of motor cars should investigate this proposition without delay.

## Our Exclusive Feature

We will (at small extra cost) furnish  
our Regular Models with the

# AUSTIN

## Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.  
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

|   |   |   |           |
|---|---|---|-----------|

## A "Six" that is different

The new KisselKar 48-"Six" was designed to serve a definite purpose, to fill a distinct and different niche. It is in a class all its own. Neither a "big six" or a "little six," it fills in the gap between, making the ideal compromise for the man who considers a "big six" too big and the average sized "six" inadequate.

# 48 "Six" KISSELKAR 48 "Six"

The KisselKar 48-"Six" is one of the very few really upper-class cars selling at a moderate price. It is growing steadily in favor of those who know automobile values and buy only after careful comparison.

The lines of the KisselKar 48-"Six" are unsurpassed in beauty. The low hung body, running boards free from boxes or brackets, 21-inch doors and new, rounding top fenders will impress you with the artistic symmetry of the design. The KisselKar motor is remarkable for simplicity, power, silence and ease of control.

The KisselKar 48-"Six" riding comfort is unique. It is due to the liberal wheelbase—big wheels—big tires—springs specially constructed according to weight—unusually roomy ton-

neau—deep seat upholstery—the perfect "balance" of the car, and almost entire absence of engine vibration.

There are three KisselKar Models: 48-"Six," \$2350; 60-"Six," \$3150, and 40-"Four," \$1850—all completely equipped, electric started and lighted; left-hand drive, center control.

Demonstrations of all models are at your service at any of our hundreds of branches and agencies. Look up the KisselKar dealer in your locality, or write us for illustrated catalog.

### KISSELKAR SERVICE CONTRACT

The KisselKar is sold under a written guarantee of service to owners—a tangible, definite and specific contract that clearly stipulates the scope of Kissel-Kar Service and provides for care that forestalls trouble and retards depreciation.

VULCAN**

**1914 Announcement**  
comes as a surprise (but  
a welcome one) to every  
dealer.

The clean cut Vulcan Chassis—Study the construction.

### FITS THE TREMENDOUS DEMAND

Thousands of dealers and prospective owners have been watching and waiting for the right car at the right price. You have often predicted that **some one** would bring out a car that would adequately fill the great popular demand. Others have hit all around the mark, but the Vulcan is the first to hit the bull's-eye.

### A TRULY REMARKABLE CAR

A machine which takes its place in the front rank immediately—far in advance of anything yet announced. Will climb any hill where the wheels will hold, and stand the severest tests to which a motor can be subjected. Built, not "assembled" only. A car with no objectionable features.

### WE CAN DELIVER THE GOODS

The Vulcan is being manufactured on an extensive scale. It will be one of the most important factors in the light car field for 1914. In addition to our present large factories, we are preparing to invest millions in additional capacity. Arrangements are already in force, whereby the growth of the plant will keep steady pace with the demands of our dealers.

The Vulcan is not of "Mushroom Growth"—Years have been spent in the perfection of the car and equipping to manufacture in large quantities.

This announcement is not premature, but has been purposely withheld until the progress reached the point when deliveries of 1914 models could be positively assured.

### DEALERS GET IN LINE

This is your opportunity, but quick action is imperative—we shall not over-sell our capacity—we are appointing only a limited number of the best dealers—no more than we are able to supply with a reasonable number of cars during the season. The Vulcan dealer's agreement is the fairest ever offered. Protects the dealer as well as the producer. Automatic renewal feature makes the dealer a permanent part of the sales organization.

Wire by Night Message for option on your city or town, pending arrival of letter.

# INVADER

## *To tell the truth—*

INVADER OIL *will* leave a carbon deposit.  
So will every other oil.

INVADER OIL *will* smoke when it burns.  
So will every other oil.

When INVADER OIL is used it *may be* necessary to grind valves. Such certainly would be the case with every other oil.

A motor using INVADER OIL *can* overheat. So it can when any other oil is used.

A machine exclusively lubricated with INVADER OIL *will* eventually wear out. This would also be the case no matter what oil was used.

INVADER OIL is *not* a perfect lubricant,—neither is any other oil. There is no such thing.

INVADER OIL, however, is chemically superior to all other oils. It will deposit *less* carbon,—make *less* smoke,

# DER OIL

mean *less* grinding of valves,—make a motor *less liable* to overheat, and will cause the machine using it to last *longer* mechanically than would be the case were *any* other oil used.

*Remember that the superiority which is indicated by its better tests is a superiority which cannot be contradicted. INVADER OIL is better because its tests are better. There is no way of avoiding this fact.*

## PUBLISHER'S COMMENT.

**The Automobile Journal for Nov. 25** will be the Annual Overhaul and Equipment Number, with particular reference to the preparation of the car for winter driving. Every phase of the subject will be treated exhaustively, this applying not only to the actual work of chassis overhaul, but to those accessories, supplies and fittings which make for comfort, convenience, safety and economy. Make certain that you shall not miss this, the most practical working guide and reference book of the season. Order now—direct, or through your news dealer.

**Everything indicates that 1914** is to be a small car year. That is to say, there will be an unprecedented number of new machines of this class. Keep well informed on the subject by watching the new department, on pages 39-40-41, this issue.

**Of course, you are interested** in the new things offered by manufacturers of accessories and supplies. You will find the latest news concerning these on pages 49-50-51.

**Always consult the Buyer's Reference and Guide** when considering the purchase of a new car or truck, or when in need of new supplies and fittings. The concerns represented therein have gained a reputation for standard products that merits your attention and patronage. See page 87.

## Fascination

The WHITE BERLINE, even to the naturally prejudiced owner of a car of another make, has an irresistible attraction, once its quality is inquired into and its performance known. Where sentiment for another car has not prevented investigation, it will be found that the WHITE BERLINE alone possesses all of the correct and fundamental features of construction, and wealth of appointments, without which, a car of this type is today practically obsolete.

THE WHITE  COMPANY  
CLEVELAND

*The allurements of the White Berline causes Neptune and Amphitrite to forsake their sea-home.*

## THE LINCOLN HIGHWAY OF COLORADO.

**Splendid Example Set by Co-Operative Effort of Several Counties--Forms Important Link in Scenic Transcontinental Route--How Convicts Are Employed.**

**P**OSSESSED of scenic grandeurs surpassing in many respects those of any other country in the world, the people of Colorado, stimulated by the boards of trade, chambers of commerce and good roads organizations, have been actively engaged during the past three years in formulating highway plans, the working out of which is expected to make for increased tourist traffic. This movement had its inception in the minds of those who had become convinced that the reason Americans failed to "See America First" was due largely to the fact that many sections of the country which naturally would attract them did not offer the inducements, particularly with reference to highway facilities, that were available abroad.

At first the state highway commission, which must be given due credit for sensing the desires of the people, was hampered somewhat by legal entanglements which effect-

ually tied up state highway funds for a time. The matter at issue had to do with the question as to whether the legislative power of the common-

wealth was vested in the general assembly, or whether the initiative and referendum clause in the state constitution reserved such power to the people themselves. When this question was properly framed and the matter finally was placed before the people, they lost no time in enacting the necessary provisions. The state highway commission is now free to carry out its plans.

In the meantime, however, the organizations above mentioned had been busily engaged, with the result that the public is in full accord with the proposed system, under which Colorado is to build a number of so-called primary roads, connecting the principal centres, one with another, and forming a network of state highways. Chief among these is the Pikes

Where the Lincoln Highway of Colorado Enters the Historic Ute Pass.

**The Historic Gateway from Colorado Springs and Pikes Peak Region to the Mountain Country Beyond.**

Peak transcontinental route, renamed the Lincoln highway of Colorado, which crosses the central portion of the state, and connects with the Golden Belt road to Kansas City on the east and the Midland trail to Salt Lake City on the west.

As was to be expected, there is bound to be some confusion between this Lincoln highway of Colorado and the transcontinental Lincoln memorial highway of the Lincoln Highway Association of Detroit. This is particularly true, because the national route from New York to San Francisco, selected by the larger body, enters Colorado at Julesburg, visits Denver and turns northward to Cheyenne, Wyo., whereas the state route is as indicated by an accompanying map.

The Lincoln Highway Association of Colorado was formed at a conference in Colorado Springs, Feb. 7, 1912, the following counties being constituent members: Kit Carson, Lincoln, Elbert, El Paso, Teller, Park, Chaffee, Lake, Eagle, Pitkin, Garfield and Mesa. It is claimed by this association that this was the first link in any transcontinental highway to be named officially in memory of the martyred President, and that recognition of this fact was given by the Colorado Good Roads Association, the state highway commission, the American Automobile Association and other equally important authorities.

Since the organization of this association, approximately \$200,000 has been expended by the counties and the state, and the work now completed, under way or contemplated for this winter assures a permanent, first class highway from the Kansas to the Utah line. In many places, convict labor is being employed and Garfield

county has contracted with the state for a gang of 40 convicts for four years for work on its portion of the road.

The Lincoln highway of Colorado connects just east of Burlington, Col., at the Kansas line with the Golden Belt road of Kansas and is a continuation of that road from Kansas City, as well as the Rock Island highway from St. Joseph, Mo. It continues westward through central Colorado straight to the mountains, and enters the range at Manitou. It next follows the historic Ute pass, through which, centuries before the coming of the white man, Ute Indians had worn a trail from their homes to the healing springs at Manitou and to their worshipping grounds in the Garden of the Gods in the Pikes Peak region. It crosses the South Park district to Buena Vista, thence up the Arkansas river to Leadville, surmounting the Continental Divide by a gradual ascent over Tennessee pass. An alternate route is now under construction by way of Independence pass. From the crest of the continent it descends by way of Eagle canyon and the Canyon of the Grand to Glenwood Springs, and down through the Grand valley to Grand Junction and the Utah line.

This highway traverses a country rich in scenic and historic interest. Crossing the plains of eastern Colorado, the motorist sees where the pioneers of a new, scientific agriculture are building up an empire in the footsteps of the "fortyniner," the Indian and the buffalo. As the journey progresses westward, the dim outline of Pikes Peak is seen in the distance, and the signifi-

**Convict Labor Has Been Engaged for Six Years in Cutting the Granite Walls of the Ute Pass.**

Where the Highway Traverses Western Section of Grand Canyon, Near Glenwood Springs.

cance of the "Pikes Peak or Bust" days is impressed upon the modern traveller. In the Pikes Peak region a wonderful variety of mountain scenery is unfolded to the tourist, with automobile roads leading in every direction. One of these, the Colorado Springs-Canyon City state highway, has just been completed. It was built entirely by convict labor and is conceded to be one of the finest motor roads in the West.

Manitou, with its wonderful mineral springs, is at the gate of Ute pass. At Florissant, are the fossil beds and the petrified trees, and opportunity may be had to visit Cripple Creek, the world's greatest gold mining camp, only 17 miles distant. At Lake George, the tourist reaches the fishing country, and from this point along the entire journey he is within constant touch with some of the best trout fishing streams in the country. Near Buena Vista, the first view of the snow capped peaks of the Continental Divide appears, and at the crest of Tennessee pass the motorist is 10,200 feet above sea level. It is maintained that this is one of the most accessible of all the mountain passes, because it must be kept open during the winter months, in order to enable ranchmen to bring their produce into the city of Leadville, world famed as a mining camp.

The Independence branch joins the main road at Twin Lakes, and descends the western slope by way of Aspen and the picturesque Roaring Fork valley. It rejoins the Tennessee pass route at Glenwood Springs, with its natural hot water pool and its many points of scenic interest. Beyond Glenwood Springs the road passes through the finest orchard sections of the Grand valley.

Colorado's employment of convict labor, not only on this highway, but on other roads within

the state, has proven highly successful, and it is held to be a factor that is rapidly bringing that commonwealth to the fore in the development of its state highway system. According to the report of the warden of the state penitentiary, 157 miles of roadway were constructed during the last biennial period, at an estimated saving to the counties of \$223,479.56.

The convicts have been employed largely upon the mountain and more difficult roads, and the model highways they have constructed have stimulated road improvement and development in every section. Convicts at work on the roads and in camp are allowed much of the freedom of the ordinary camp, and are placed on the honor system. There is only one unarmed guard on duty at each camp at a time. The practicability of this plan has been demonstrated by the small percentage of escapes attempted during the six years that work of this nature has been carried on. Care, of course, is exercised in the selection of men for road work and 10 days' time is deducted from the convict's sentence for each month's work on roads, this being in addition to the regular allowance for good behavior. The outdoor life appeals to the men, who strive to be placed on the road gangs, and the work is highly beneficial physically, as well as morally, to the convicts themselves. At least, this is the view taken by Colorado, which has been one of the pioneer states in the adoption of this convict labor plan, its methods having been copied in

Looking Westward Toward the Mountains Near Manitou in Central Colorado.

**A Section of the Colorado Springs-Canon City State Highway, Recently Completed by Convict Labor.**

many other sections of the United States.

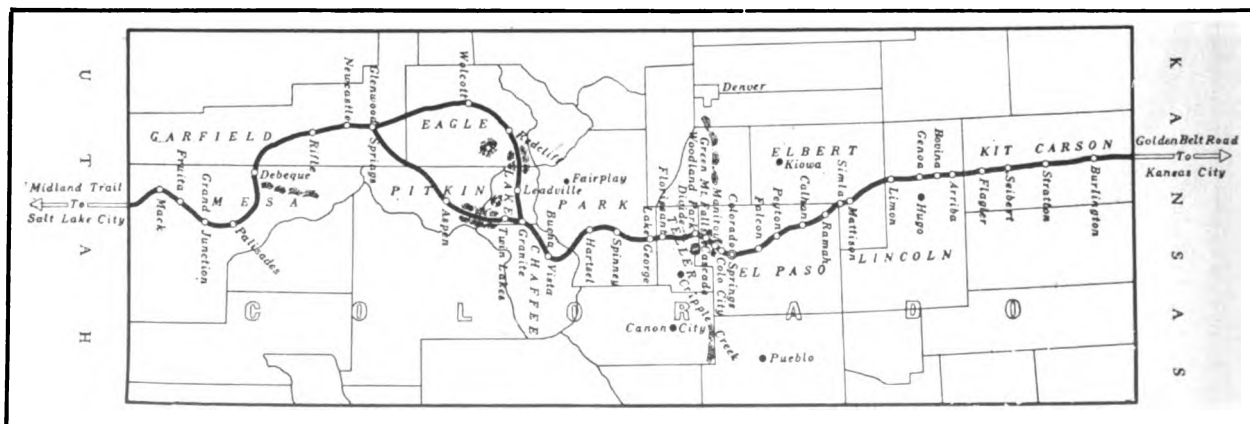

According to the figures given by the warden, the work has been done at an average cost to the various counties of 32 cents a day a man, this cost including Sundays and holidays. In addition to the convicts, 21 state teams were employed, the feed for these averaging \$20 a month a team. The average labor cost for the 157 miles worked was \$298.12 a mile.

As has been stated, much of this work was on the Lincoln highway of Colorado. The work in Mesa county alone would have cost, according to the warden's estimate, not less than \$25,000 a mile under free labor. This was due in a large measure to the fact that in places the rock had to be blasted for 75 feet in order to get a proper road bed. In this work it was necessary to drill holes 25 feet deep, and to drill three depths before the road bed was reached. The work in the Ute pass, in El Paso county, was done through solid rock for six miles—all blasting.

This necessarily would have been very expensive work had it been done with free labor, and

the counties would have been forced to pay big salaries to drillers, blasters, powder men, masons and cement workers. Not counting the contractor's profits and not including any skilled labor, except blacksmiths, cement workers and masons, the warden estimates that the value of free labor would have been \$161,040. He places the cost of free labor and teams at \$266,285. He says the state worked an average of 20 masons and cement workers, and five blacksmiths, and he maintains that none of this labor competed with free labor of the state, for the reason that the counties could not otherwise have afforded to do this work.

It may be added that the work on the Lincoln highway of Colorado is to a uniform width throughout. Across the plains the material is mainly a sandy loam or gravel, with very little adobe or clay. There are few important bridges as the streams are small. Concrete is utilized in bridge work in many places throughout the state. In the mountains, and particularly wherever blasting work has been necessary, the road surface is of disintegrated granite. There are few heavy grades, and for the most part these are short. Wherever practicable the grades have been reduced, so that the climbing is gradual and easy. From the Kansas line to Colorado Springs the route has been very carefully marked with markers composed of a red, white and blue band. This work is now being continued along the western half, so that this should be one of the easiest transcontinental routes for the tourist to follow. Moreover, it sets an excellent example for the various other roads, on which the state highway commission is actively engaged.

**Map of the Pikes Peak Transcontinental Highway, or the Lincoln Highway of Colorado, and Its Connections.**

# COES

## THE Wrench Supreme

Strength without bulk or clumsiness.

Ease of handling without slipping or bruising.

Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" Trade Mark Reg. U.S. Pat. Office AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" Trade Mark Reg. U.S. Pat. Office wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

## HAYNES FEATURES ELECTRIC GEARSHIFT.

**F**OR the season of 1914 the Haynes Automobile Company, Kokomo, Ind., has increased its line by the addition of two new models, both equipped with six-cylinder motors, and these, with the four, are featured with the Vulcan electric gearshift. Option is given of the conventional hand gear lever, however, at a reduced price. The company continues its policy of fitting a number of different body styles, these including a two-passenger roadster; four, five, six and seven-passenger touring; coupe and limousine. The last named type is fully enclosed, of seven-passenger capacity, and fitted to the model 27 chassis.

The new line presents a number of new features. The driver is placed at the left with the emergency brake lever in centre, and a pressure fuel feed with large capacity tank suspended at the rear of the chassis replaces gravity. The policy of the company to offer every convenience is noted in the adoption of a motor driven tire pump; the provision for ample storage space, and the continuation of the Leece-Neville electric lighting and motor starting system. Many refinements are noticeable and the equipment, as usual, is very complete.

The new chassis are designated by serial

**Pressure Feed, Fuel Tank Suspended at Rear.**  
**Electric Lighting and Motor Starting.**  
**Two-Cylinder Gear Driven Power Tire Pump.**

the latter 136. Model 28 has a four-cylinder power plant. All cylinders have the same bore and stroke, 4.25 by 5.5 inches, the stroke being the same as last season and the bore being reduced slightly. The S. A. E. rating of the four-cylinder engine is 28.9, which brings it within the

line of demarcation, 30 horsepower, in those states utilizing the rating as a basis in computing registration fees and providing a class of 20 to 30 horsepower inclusive. The factory dynamometer rating, however, is 48. The horsepower production of the larger motor is 65, although rated at 43.8 by the S. A. E. formula.

The Haynes company has joined the ranks of makers of the L head type of motor with the valves located on the right and enclosed by easily removed plates. The crankshaft is two inches in diameter, of chrome nickel steel, and is slightly offset from the cylinders. The total length of the bearings on the four-cylinder unit is 11.5 inches and 14 on the six, proportions making for durability and efficiency. The connecting rod length is 11 inches, from centre to centre, reducing side thrust to a minimum, while the piston is 5.125 inches long, carrying four .25-inch rings. The wristpin is of chrome nickel steel, 1.125 inches in diameter by 2.8125, and oscillates in the piston bosses. The camshaft is constructed from 30-

Presenting Some of the New Body Designs of Haynes 1914 Line, Comprising Three Models—Two Sixes and a Four.

numbers, models 26 and 27 being fitted with six-cylinder motors and differing only in the length of wheelbase, the former being 130 inches and

point carbon steel, is 1.125 inches in diameter and is carried in three bearings on the six-cylinder motor, which has a total length of bearings of

16.125 inches. That of the four is 11.9375 inches. All cams are integral.

The cylinders are cast in pairs and have large water jackets. Cooling is by a centrifugal pump, aided by a large pressed steel adjustable belt

lubricating the large end, also splashing oil to the piston, walls, etc. A tapered groove directly under the lower ring displaces surplus lubricant.

The pressure pump is of the plunger type, with a check valve in the line to the tank, ports

**Illustrating the Mechanical Details of the Haynes Chassis, Having Electric Gearshift, Lighting and Motor Starter, and Power Tire Pump.**

driven fan. The radiator is of the cellular type, of ample capacity to meet the requirements of the most severe service. It is 3.875 inches thick on the six and three on the four. Carburetion is by a Stromberg and ignition by the latest type American Simms magneto, which produces a hot spark fully retarded.

Both the oil pump and that maintaining air pressure in the fuel tank are actuated by an eccentric on the camshaft. The lubrication system of the Haynes is simple and efficient, the supply being in proportion to motor speed, and it is held that smoking and carbon are eliminated. The oil is drawn from the lower section or compartment of the crankcase, forced through a sight feed on the cowl board, thence to a distributing manifold in the upper section of the case. It flows by gravity through outlets in the manifold to troughs connecting with the main crankshaft bearings, to a hollow idler gear stud, and to individual compartments under the connecting rod. The lubricant from the main bearings overflows to the sump; that from the idler gear stud to the timing gears, thence to the base, where it is screened before again being circulated. Hollow scoops on the connecting rods dip into the oil,

being utilized for the admission of air. The pump is provided with a safety valve having adjustable features for obtaining varying pressures. Both the fuel and air lines are annealed copper tubing with walls of ample thickness. The fuel tank is suspended at the rear of the chassis by heavy cast steel brackets, which also serve as tire carriers. The tank is of heavy drawn sheet steel, a two-piece member, one head and the full length being constructed of one sheet of metal. The other head is inserted and welded into position. A gauge and a convenient filler are provided. The adoption of the pressure feed system permits of carrying the carburetor higher than formerly, and in proximity to the jackets, assisting in carburetion.

The transmission is of the selective type, providing three forward speeds and one reverse, and the gears are constructed of 3.5 per cent. nickel steel, have .875-inch face and are made in an electric furnace. The shafts are liberal in dimensions, of chrome nickel steel and Timken roller bearings are utilized throughout.

The Vulcan electric gearshift has been completely described and illustrated in these columns. In brief, it relieves the driver of all exertion other than pressing

- Model 28 4-Cyl. Coupe.

**Showing Location and Compactness of Power Tire Pump and Method of Meshing Gears.**

a button and depressing the clutch pedal when a change of speed is desired. The control unit is mounted on the steering wheel and is very compact and convenient, as will be noted by an accompanying illustration. Depressing the clutch pedal closes an electrical circuit, actuating electro-magnets or solenoids, drawing the desired gear into mesh, providing an instantaneous change and eliminating danger of stripping the gears. The Haynes company subjected the device to severe tests before adopting it.

Drive to the rear axle is by shaft, a Hartford double joint universal being employed. The axle of the four-cylinder model is of the full floating type, a McCue, of ample dimensions and having 12 and 16-inch brakes of the internal type. Large diameter ball bearings are utilized throughout. The front axle is also a McCue. A Timken rear axle is employed with both six-cylinder models, in which brakes are of the external and internal type, 16 and 15.5 inches in diameter, respectively. The material in both axle housings is pressed steel and gears and shafts are of chrome nickel

**Presenting Neutralizing Cam of Electric Gearshift and Arrangement of Solenoids.**

steel and of ample proportions. Timken front axles are used on models 26 and 27. The spindles are of chrome nickel steel, 1.5 inches in diameter, with the axle of I beam open hearth steel, heat treated. Wire wheels are optional.

The steering gear is a Warner, of the worm and worm gear type, and easily adjusted as to wear. The frame is made from .1875-inch hot rolled, cold pressed steel and the cross section and depth dimensions are very liberal. A double drop provides a low centre of gravity, also permitting of lower suspension of the body. The springs are of ample length, of carefully selected high grade steel, ground and polished, and insure comfortable riding qualities. The spring bolts are of nickel steel, hardened and ground, and the grease cups are integral with the spring bolt. All spring eyes have hardened steel bushings.

The power tire pump fitted to the Haynes motor is not only light and compact, but very efficient. The pump is actuated by gears, the driven member being thrown into and out of mesh with the driving gear by means of a hand lever. Fifteen feet of high grade hose, ample to reach any tire valve on the car, and a 120-pound capacity gauge are supplied with each pump. The lighting dynamo and motor starter are separate units.

**Control Switch of Electric Gearshift, on Steering Wheel.**

The bodies of the Haynes are the result of much study and careful designing and the upholstery is deep and luxurious. Ample room is provided in both the front and rear in the touring models and the doors are extra wide, upholstered in leather. All hinges are concealed. The cowl is constructed from one piece of metal and curves gracefully to the hood. The body styles of the four-cylinder model are replicas of the six, insofar as design is concerned, one simply being larger than the other. The design, upholstery and appointments of the coupe and limousine are particularly attractive, the doors being wide and the body curves graceful. The standard color is Indiana dark blue with black gears and wheels. Option is given of a Pacific Tour gray body. The finish is particularly high grade, a large number of coats making for durability. The equipment is very complete.

# BOSCH MAGNETO EQUIPMENT FOR FORD.

**B**ELIEVING that there is a demand for a Bosch magneto on model T Ford automobiles, the Bosch Magneto Company, 225 West

Fig. 1—New Bosch Switch Used with System.

46th street, New York City, has perfected and is manufacturing a Bosch-Ford equipment which presents interesting features in that it may be installed without any alterations, machining, etc., and among its advantages is that its fitting requires no other knowledge than that of timing the magneto.

The instrument in place and method of drive is shown at Fig. 2, and it will be seen that a silent chain sprocket replaces the usual timer and that energy is transmitted by a silent chain to another, smaller sprocket, mounted on the armature shaft of the magneto. Crankshaft speed is obtained by utilizing a 30-tooth sprocket on the camshaft (timer shaft) and employing a 15-tooth sprocket on the magneto.

The sprockets are made carefully and have a guide to prevent any possibility of the chain running off in operation. The efficiency of the silent chain method of drive is well known. In the Bosch installation the proportions and material have been given careful consideration, and the drive has been well tested before announcing the equipment.

The method of mounting the magneto is novel and the design is sturdy. By referring to Fig. 3 it will be seen that the bracket is so formed that it fits neatly to the left hand side of the motor, being secured at the bottom to the crankcase by the second and fourth bolts. The upper portion of the bracket is secured by the first two or forward bolts retaining the cylinder head. As the holes are accurate, no fitting is required, the bracket slipping easily into place. Being constructed of aluminum, weight is reduced to a minimum and it does not detract from the appearance of the power plant. The magneto is mounted on a shelf or base and is provided with slotted holes so that the instrument may be slid

inwardly or outwardly to compensate for any wear or stretch of the chain, and it is obvious that the arrangement facilitates installation.

The magneto is the well known Bosch DU4, a true high-tension instrument, eliminating batteries, coils, timers, etc., and capable of producing a hot spark on a quarter-turn of the starting crank. Variable advance is provided, the circuit breaker box being advanced or retarded as desired by the usual movement of the spark lever. The conventional connection is utilized, a rod being fitted to it and attached to one end of an extended bell crank as shown at Fig. 2. The other end of the extension bell crank is attached by a small arm to the breaker box. No alterations or fittings are necessary, as the rod is accurately proportioned.

A new switch has been designed for the equipment and is fitted in the dash. The switch, which is shown at Fig. 1, has a button and key in combination, which can be removed in the same manner as an ordinary key, thus locking the ignition. A metal plate is provided to cover the opening left by removing the usual coil. A rear view of the switch, also the method of carrying the high-tension wires, is shown at Fig. 2.

The wiring is very simple, as indicated by the diagram presented at Fig. 4. Four leads are utilized between the distributor and the spark plugs, while a primary wire is connected to the ter-

Fig. 2—Bosch-Ford Equipment, Including a True High-Tension Magneto Driven by Silent Chain from Sprocket on Camshaft.

minal on the breaker box and led to the switch, thence to ground. As indicated in the drawing, the magneto would supply current to the plugs as

the switch is open. Closing it diverts the primary current to ground. This is accomplished by the push button switch above referred to.

**Fig. 3—Showing Driving Sprocket Ready for Attachment and Aluminum Bracket Which Is Bolted to Motor—No Alteration or Fitting Is Required.**

The firing order and direction of rotation of the armature shaft and distributor are given in the wiring plan and it will be noted that the magneto is driven anti-clockwise, consequently the distributor revolves clockwise. The proper connection of the leads to the spark plugs is also shown and the simplicity of the wiring is apparent.

To install, the radiator is displaced, also the priming wire, fan and pulley assembly and the rod connecting the spark control with the timer. The last named member is next removed with its wires and discarded. The hexagon nut utilized to secure the timer is re-employed to retain the driving sprocket, which is also held by a special key pin supplied with the equipment. By doubly locking the gear there is no possibility of its slipping or working loose in service.

The magneto is next set on its bracket, aligned and the timing rod attached to the ball crank. The timing of the DU4 magneto is practically the same as with other cars. The piston of the first cylinder (that nearest the radiator) is brought to the top of the compression stroke and the armature shaft rotated by hand until the distributor brush rests on the No. 1 segment. With the timing lever or spark fully retarded, the armature is turned in its direction of rotation until the platinum contact points begin to separate. The chain is then fitted. The only precautions to be observed are: Not to rotate the armature after the proper setting is obtained or change the position of the piston.

The advantages obtained with a magneto are numerous. Synchronization of the spark is assured, coils and their adjustment eliminated, an inexhaustible source of current supply provided, more power and greater motor efficiency by reason of a more complete combustion of the fuel. The improvement over the conventional coil system is marked, and the results obtaining with a Bosch magneto on a model T Ford were outlined in The Automobile Journal of May 25, the writer being present at tests made before and after the installation of the instrument. The Bosch-Ford equipment is adaptable to all Ford motor cars produced since 1910 and will be carried in stock at the home office and branches.

### BUYS MEZGER SPARK PLUG.

**Production Will Be Known in the Future as the J-M (Mezger) Soot-Proof.**

The H. W. Johns-Manville Company, New York City, announces that it has just taken over the manufacture and distribution of the Mezger Soot-Proof spark plug, which will be known in the future as the J-M (Mezger) Soot-Proof. Under the terms of the sale, R. M. Owen & Co., New York, distributor for Reo and Premier cars, will retain its interest in this product. The former maker was C. A. Mezger, Inc., New York City.

The plug has been on the market since 1900, and is said to be one of the first American designed and built on scientific principles. Over 400,000 have been sold for use on America's leading cars. The H. W. Johns-Manville Company will provide increased factory facilities to meet a growing demand, and mechanical devices of the

**Fig. 4—Wiring Plan of Bosch Magneto on Ford—The Direction of Rotation of Armature and Distributor Is Indicated by Arrows.**

latest and most approved design will be installed. Those interested in spark plugs will receive a neat little booklet describing this product in detail by making request of the new owner.

### BUILDS HAYNES CARS.

#### A. N. Wilhelm Is Factory Superintendent of the Pioneer Kokomo Concern.

Sometimes the motoring public fails to consider the important part played by the mechanical force in the production of a given car. The work of the designer, the sales manager and, perhaps, other officials of the concern, is given due weight, but it is seldom indeed that the man who sees the actual work of construction is given more than a passing thought. Of course, this comment could be made to include the workmen as well, but it undoubtedly will be conceded that the efforts put forth by the rank and file are a reflection of the personality of the factory superintendent.

A. N. Wilhelm, factory superintendent for the Haynes Automobile Company, Kokomo, Ind., pioneer American gasoline automobile manufacturer, was born and reared on a farm outside the little town of Winamac, Ind. It was not until his 20th birthday that he migrated to Peru, where he apprenticed himself to the Peru Electrical Manufacturing Company. At the end of nine years with this concern he had developed into one of the most expert machinists in the country.

In 1903 he began making tools for the Haynes Automobile Company. Under the tutelage of A. G. Seiberling he progressed so rapidly that when the latter temporarily severed his connection with the company the mechanic accompanied him. Neither man forsook the industry, however, so that the five years' change may be said to have broadened their experience. In the fall of 1912 both returned, one in the capacity of general manager and the other as factory superintendent. The latter set for himself the task of increasing the production of Haynes cars, and, as has been the result with every task he has undertaken, he is succeeding.

### BUYS McCUE WHEEL PLANT.

#### George W. Houk to Operate Factory Under the Name of Houk Wire Wheel Company.

George W. Houk, president of the George W. Houk Company, Philadelphia, which concern owns the American rights to the Rudge-Whitworth wire wheels made in Great Britain, has

purchased the plant, good will, stock in trade and business of the McCue Company, 1700 Elmwood avenue, Buffalo, N. Y., where the McCue wire wheels have been made during the past two years. It is understood that the purchase price was \$400,000, in addition to assuming an indebtedness amounting to some \$38,000.

The plant is to be operated by the Houk Wire Wheel Company, a new concern capitalized at \$900,000, \$400,000 of which is preferred stock carrying a six per cent. dividend. George W. Houk is to be president and W. F. Evans, general manager of the McCue Company, is to assume the management of the new organization.

It is stated that the company will manufacture a wire wheel, embodying the features of the Rudge-Whitworth, although of somewhat different design. It is assumed that it will carry the Houk demountable rim, heretofore manufactured by the George W. Houk Company, which is to continue as distributor of the product.

### BUICK COMPANY CHANGES.

#### J. T. Wilson to Succeed E. J. Copeland as Purchasing Agent for Flint Concern.

E. J. Copeland, for the past three years purchasing agent for the Buick Motor Company, Flint, Mich., has resigned to go with the Corcoran Lamp Company of Cincinnati, O., as general manager. James T. Wilson, for the past four years buyer for the Durant-Dort Carriage Com-

At Left, E. J. Copeland, Who Resigns as Purchasing Agent of Buick Motor Company, and at Right, James T. Wilson, Who Succeeds Him.

pany, also of Flint, will succeed to the position. He has already assumed a portion of his new duties, although Mr. Copeland will not leave the Buick concern until the first of the year.

Mr. Copeland succeeds Thomas Corcoran, who will devote his entire attention to the factory end of the lamp business. That he is well qualified for his new responsibilities is indicated by the fact that during the three years of his service with the Buick company the purchases have averaged a little over \$20,000,000 a year. He began with this concern as stenographer for H. E. Shiland, at that time sales manager, and within 30 days was made assistant purchaser.

### ENJOYS ITS BEST YEAR.

#### Sales and Profits of National Motor Vehicle Company Largest in Its History.

The annual report of the National Motor Vehicle Company, Indianapolis, Ind., made at the recent annual meeting, showed that the sales and profits for the fiscal year, ending Sept. 1, 1913, were the best in the 14 years of the company's history. The stockholders were so well pleased with the showing that a resolution of thanks and congratulations was

George M. Dickson, General Manager, National Motor Vehicle Company.

passed giving a large measure of credit for this success to the untiring efforts of General Manager George M. Dickson.

As the result of the election, the old board of directors was continued in office, this comprising A. C. Newby, Robert Martindale, P. W. Manchester, William Guy Wall and George M. Dickson. Last year's officers also were re-elected as follows: President, A. C. Newby; vice president, W. G. Wall; secretary and treasurer, George M. Dickson. At the conclusion of the meeting Mr. Dickson issued a statement, which read in part as follows:

The National stockholders were of the firm opinion that one of the elements entering into their company's success has been the firm policy of building a quality car and not catering to fads, single season styles or any ex-

perimental changes, in order to lure sales. We build on the series basis, every day beginning a new year with us. We are constantly improving, perfecting and developing our cars and not upsetting all our manufacturing efficiency and economy by constantly changing models with the seasons. The result is that we have accumulated experience to go by and we believe we are giving the public a greater value. Our success this year is evidence of the prestige the National car enjoys with the motoring public.

### GENERAL MOTORS REPORT.

#### Earnings for the Fiscal Year Exceed All Past Records of the Company.

The annual report of the General Motors Company, Detroit, Mich., shows gross earnings of over \$85,000,000 for the past fiscal year, exceeding all previous records of the company. The net earnings were \$8,184,052, equal to over 50 per cent. on the preferred, or 39.01 per cent. on the common stock, as against 17.4 per cent. in 1912. The statement follows:

|                                    | 1913        | 1912        |
|------------------------------------|-------------|-------------|
| Net profit .....                   | \$8,284,130 | \$4,838,448 |
| General Motors Company's share.... | 8,184,052   | 4,746,756   |
| Accrued interest on notes.....     | 724,581     | 850,563     |
| Balance for dividends.....         | 7,459,471   | 3,896,293   |
| Preferred dividends .....          | 1,048,534   | 1,040,210   |
| Surplus .....                      | 6,410,937   | 2,856,082   |

The profit and loss statement shows the application of surplus earnings above the preferred dividend as follows:

|  |             |
|--|-------------|
| Profit and loss surplus, July 31, 1912.....      | \$1,262,594 |
| Add undivided profits 12 months to July 31, 1913 | 6,410,937   |

|   |             |
|---|-------------|
| Total.....  | \$7,673,532 |
| Reduce inv. assets Oct. 1, 1911, liq. losses..... | 4,728,152   |

Profit and loss surplus, July 31, 1913.....\$2,945,379

In his annual report President C. W. Nash says, in part:

Net profits of \$8,284,139 are after deducting all losses of certain of the subsidiary companies, also all expenses of the parent company, and also after deducting \$1,098,482 for depreciation of buildings and equipment in addition to ordinary maintenance. Subsidiary companies operated at a loss during the year were few in number. The policy will be observed of continuing as going concerns only such of those companies as can be made to yield a profit.

The sole funded debt, July 31, 1913, consisted of \$10,935,000, six per cent. first lien notes, maturing Oct. 1, 1915, being the balance of the original issue of \$15,000,000, dated Oct. 1, 1910. Oct. 1, 1913, the company was required to pay \$2,000,000 to the trustee for account of sinking fund. The company anticipated the payment of \$1,000,000 during July, and since the close of the fiscal year has paid \$1,000,000 additional. The total amount, with interest, was applied by the trustee to the purchase of \$2,022,000 notes, and there are now outstanding \$9,899,000 notes out of the original issue of \$15,000,000.

Aside from these notes, the only other indebtedness consisted of accounts payable of \$4,821,744, and notes payable of \$900,000. The \$900,000 notes payable are the balance of notes of the Weston-Mott Company, issued in connection with the purchase of the 50.2 per cent. of the stock of that company not already owned by General Motors. These notes matured Sept. 15, 1913, and have been paid since the close of the fiscal year.

Further progress has been made in the development of the truck business. The trucks built by this company, both gasoline and electric, are giving general satisfaction and the coming year should show a large increase in volume of sales.

# FEATURES OF FOREIGN LIGHTING DYNAMOS.

Majority of Makers Provide Manually Operated Switch for Cutting Out Generator When Battery Is Fully Charged.

(By C. P. Shattuck.)

**L**AST fall The Automobile Journal described in detail the construction and operation of the numerous electric lighting systems made in this country and supplemented the serial with a discussion of the C. A. V., a prominent English equipment. It will be remembered that the last named system varied considerably from American equipments, the most marked difference being the device utilized to prevent the battery discharging through the generator.

In the following brief descriptions of some of the best known foreign dynamos, it will be noted

contrast to American methods, but it is explained by the fact that the foreign car maker has not, until very recently, given the mounting of the lighting dynamo consideration, believing that the choice of an equipment is best left to the motorist. There is also considerable difference in the openings or bolt holes and other dimensions which are given in an accompanying table.

There is no doubt that the failure of the manufacturer to make provision for installation by fitting bases or platforms on the power plant, coupled with the fact that lighting equipment is

that in the majority provision is made for cutting out the generator when the cells are fully charged, a manually operated switch being included in the switchboard. This control, differing materially as it does from American practise, is regarded as highly important abroad and is held to be of distinct value, in that overcharging is prevented. The instrument utilized for denoting the condition of the cells is usually of the push button type, providing a reading in tenths, and while not obtaining as fine a reading as by the American practise of using a hydrometer, is sufficiently accurate for practical purposes.

It will be noted that the belt drive is employed exclusively abroad. This is in decided

not standard, but must be purchased by the motorist, has led the majority of motorists to equip their machines with the older forms of illumination. The price of the electric systems is also a factor, and although one small dynamo costs about \$35, the larger generators or well known equipments involve an outlay of \$200 or more, to say nothing of the extra expense of installation.

Reports from abroad would indicate that the manufacturer is cognizant of the demand for electric lighting and provision for fitting a dynamo is made by one well known car maker, a base similar in design to that utilized in this country being fitted to the motor. It would not be at all surprising if the next Olympia show (London)

would see a number of manufacturers making provision for dynamos.

In the majority of foreign lighting systems separate control of each side and headlight is favored, presumably to economize in current when the motor is inoperative, consequently the switchboard is not as neat or compact as those utilized in this country where the tendency is toward a plain dash with compact and convenient grouping of the control units.

About 70 per cent. favor electrical control of the dynamo's output, although one maker offers both electrical and mechanical. The dimensions of the generators are similar to those manufactured in this country, as will be noted by the table above referred to, it containing the approximate measurements of 11 of the largest and latest types.

#### Ducellier.

Permanent and electro-magnets are utilized in the Ducellier, and control of the output is obtained by an elec-

tronic contrivance which weakens the magnetic field as the speed of the machine increases. A third brush is utilized on the commutator, it being made adjustable so that the output may be regulated to meet the requirements of each installation, and it is connected to an electro-magnet immediately above the armature, producing a field in opposition to that of the main or permanent magnets. The intensity varies with the speed of the machine, tending to keep the output constant after normal speed has been attained.

The Ducellier resembles the conventional magneto and that appearance is further increased by the use of a metal strap for securing it to a table. The last named member slides in rails, so that the tension of the belt may be adjusted, a screw being fitted for this work. It is noticeable of the design that the same precaution is not taken to protect it from the entrance of dust and other foreign elements as with other types, and it would appear that more or less dirt would find its way to the commutator when the machine is exposed to mud and water. Three switches are provided, similar to those formerly utilized when battery ignition was popular, one controlling the headlights, the second the side and tail lamps, while the third controls the charging of the battery. It is stated that the side and tail lights may be supplied with current direct from the dynamo.

put of the dynamo being held at a proper value by an ingenious use of magnetic actions and reactions which occur between the armature and the field magnets, and it is maintained that the output is kept absolutely constant at all speeds of the car. There are two ordinary poles and two subsidiary poles. The latter are excited by the windings, which are supplied with current from the working mains. The magnetic flux excited from these windings passes, when not distorted, diametrically through the armature from one subsidiary pole to the other subsidiary member and, dividing right and left, finds return paths through the frame of the dynamo. The two ordinary poles have no windings upon them of any kind. Magnetism is excited in them by the reaction of the armature, not that of the whole armature, however, but the reaction due to the current generated in certain short circuited coils; namely, the coils which are for the time short circuited by the brushes that are collecting the current at the commutator. The demagnetizing reactions, increasing with the speed, counteract the tendency of the generated electromotive force to rise as the speed increases, thus the output remains constant. A free wheel is incorporated between the armature spindle and the pulley (belt drive is utilized), so that when the motor is stopped, or run too slowly for the dynamo to develop the proper charging rate, the armature can revolve freely or "motorize," thus over-running the driving pulley. It is held that owing to the design of the machine, only an exceptionally small amount of current is taken from the battery, and that the free wheel device makes it impossible for an excessive current to be dis-

tronic contrivance which weakens the magnetic field as the speed of the machine increases. A third brush is utilized on the commutator, it being made adjustable so that the output may be regulated to meet the requirements of each installation, and it is connected to an electro-magnet immediately above the armature, producing a field in opposition to that of the main or permanent magnets. The intensity varies with the speed of the machine, tending to keep the output constant after normal speed has been attained.

The Ducellier resembles the conventional magneto and that appearance is further increased by the use of a metal strap for securing it to a table. The last named member slides in rails, so that the tension of the belt may be adjusted, a screw being fitted for this work. It is noticeable of the design that the same precaution is not taken to protect it from the entrance of dust and other foreign elements as with other types, and it would appear that more or less dirt would find its way to the commutator when the machine is exposed to mud and water.

Three switches are provided, similar to those formerly utilized when battery ignition was popular, one controlling the headlights, the second the side and tail lamps, while the third controls the charging of the battery. It is stated that the side and tail lights may be supplied with current direct from the dynamo.

#### C. A. V.

In the C. A. V. system, which was fully described and illustrated in the issue of The Automobile Journal for Dec. 25, 1912, cut-outs and regulators are eliminated, the out-

charged from the cells through the dynamo. Because of the extremely low speed at which the dynamo generates, the free wheel only comes into action when the engine is actually stopped.

A switch is provided for disconnecting the cells from the generator when the motor is inoperative and should it accidentally be left on, the buzzing of the free wheel is sufficiently audible to attract the driver's attention. The maker points out that the manually operated switch is a distinct benefit in that the dynamo may be cut out when the cells are charged, and that overcharging is thereby prevented under all conditions of service.

Systems utilizing six and 12-volt batteries are produced, the company making a variety of dynamos to meet different installations. The C. A. V. switchboard differs from American conventional practise in that separate switches are provided for the right and left headlights and side lamps. Single members are used for the dynamo and tail light and in one type of board a mechanical charge indicator is utilized in place of the ammeter, also a switch arm on the outside for the lamps. The design also includes a half-output switch and a dynamo emergency member located inside the board. Tumbler type switches are utilized. The C. A. V. company manufactures its own lamps.

#### Brolt.

The Brolt is a bi-polar generator having two small unwound auxiliary poles located at right angles to the main members. In the neutral position relative to the main poles are two brushes, each of sufficient width to short circuit the several coils of the armature, and cur-

rent for charging the storage battery is collected by these brushes in the conventional manner. As the speed of the armature increases, its current creates a flux in the unwound poles, which is cut by the short circuited armature coils. Currents begin to flow therein of a strength proportionate to the speed of rotation, and resulting in demagnetization of the main poles. The maker claims that this method of control reduces sparking to a minimum.

The generator is driven by belt at low speed, about 1.5 times that of the crankshaft of the engine, and the charging of the cells begins at approximately 16 miles an hour car speed. With the large generator the output curve shows about 12 amperes at 1500 revolutions a minute, and there is no further increase up to 4000 revolutions, although the chart shows a rapid rise after the cutting in of the generator.

The switchboard is a neat aluminum case, black finished, and the cut-out is enclosed in this unit. Located in the centre of the board is an ammeter showing permanently the charging rate, and the same needle gives voltage upon pressing a button. The control switch is of the rotating type, the circuit being denoted by the appearance of words behind a glass panel such as "charging," "head," etc. Beside the voltmeter is another window, enclosed by a red glass, lighted by a small lamp in series with the tail light.

#### Lodge.

Compactness and simplicity are noticeable in the Lodge generator, which is of the permanent magnet type, belt driven, and it is designed to be operated at high

containing the armature, cut-out, etc., is made in two sections and is sealed, an arrangement preventing tampering and avoiding disputes between the maker and owner in the event of trouble.

It is held that the output of the dynamo at high ratios does not overcharge the cells. It is presumed that the charging rate is such that in average service the cells would be properly maintained, but it would appear that they would be subject to overcharging if the car were to be used but little at night and driven considerably in the day time. The only switches employed with the system are the lighting members, meters being eliminated.

#### Lithanode.

A simple form of bi-polar generator is noted in the Lithanode, with which the output is allowed to increase with the speed of the instrument, no subsidiary windings or opposing currents being utilized. The method employed to prevent an excess current damaging the lamps is novel, it being accomplished by the resistance of nickel wire. This material is held to possess the characteristic that its resistance increases enormously at and above a certain critical temperature and unlike iron, which has the same feature, is not liable to oxidation through moisture or heat. By suitably proportioning the length and dimension of the wire, which is incorporated between the generator and the dynamo, the current is held to a predetermined value, and any above a certain amount merely heats the wire.

A centrifugally operated switch is utilized to break the circuit when the dynamo is inoperative, two miniature chopper switches being actuated by two small arms on

speed, as the maker claims the tunnel wound armature may be rotated as high as 8000 revolutions a minute without injury. It is also held that a large output is obtained with a pressure of six volts, enabling the use of thick lamp filaments of any desired candlepower. Four brushes are employed, these being located side by side in pairs, the object being to provide an extremely large contact.

One of the features of the design is the use of top and bottom lubricators so that oil may be supplied to the bearings whichever way up the dynamo may be fitted. The battery is prevented from discharging through the generator by a large compound cut-out located in the switchboard, and a second device is incorporated in the pulley, which buzzes if the charging switch is not thrown off when the engine is stopped. Switches of the push and pull type are utilized, and instead of the push button meter, instruments of the moving coil type are utilized. These are similar to those employed with American lighting systems, the indicating needle denoting charging and discharging rates. Instead of a dash tell tale for denoting breakage of the tail light filament, a buzzer is employed.

#### En Route.

The En Route is designed chiefly for light cars and with this system the battery is floated upon the line; that is, all current utilized is drawn from the cells, which are continuously charged by the generator. This makes for simplicity, as but two wires lead from the dynamo to the battery. The cut-out is of the automatic magnetic type, is embodied in the dynamo and comes into action when the motor is stopped or when the value of the current generated is below that of the cells. The casing

the armature, which members move outward, due to centrifugal force. The usual dash equipment is provided, but the head and side lights are separately controlled. Damage to the dynamo in case it is run on an open circuit, is prevented by a fuse.

#### Peto & Radford.

The system produced by Peto & Radford resembles in some of its details that of a well known American make in that a mechanical governor, a clutch operated by centrifugal force, is utilized. A double disc is employed, an arrangement that should be less susceptible to differences of engagement through wear. End thrust is also eliminated from the armature as the pressure holding the two moving discs to the rigid part of the shaft is obtained by a central spring exerting a force in each direction. The thrust due to the spring is practically self-contained in the clutch.

To prevent the battery discharging through the dynamo, a magnetic cut-out is utilized. Although designed to be driven by a belt, friction contact with the flywheel is optional. Separate control of the lamps is provided.

#### Lucas.

The maker of the Lucas dynamo has introduced a new generator, the output of which is electrically controlled, although a mechanically governed generator is marketed. The last named includes a cone clutch controlled by a form of centrifugal governor. Regulation is accomplished in the new design by a third brush located between the two main members, and it is employed to collect current from the armature, using it to intensify or reduce the strength of the field magnets. The dynamo is operated at a speed slightly higher than that of the en-

gine, about 1500 revolutions a minute with the car travelling at 20 miles an hour.

Three switches are employed, two for controlling the lamps, while the third member is for charging. The switchboard is sealed and provision is made for plugging in an inspection light. The battery used with the system differs from conventional practise in that instead of plates being flat, they are curved, it being held that the design not only prevents buckling and disintegration, but a very high discharge rate is possible.

#### **Rotax.**

The Rotax is an adaptation of the Leitner system utilized in railway lighting, the principle being that of damping the fields by means of current drawn by a pair of brushes. As increase in armature speed distorts the field, the voltage between the subsidiary brushes is first reduced, then reversed; that is, at slow speeds the current drawn by the brushes aids in the excitation of the fields, at normal is inoperative, and at high ratios is in opposition to the main field windings. The coils are proportioned to obtain a steady curve of output.

A magnetic switch is employed to connect the generator with the battery when the proper charging current is developed. Compound winding is utilized and it is held that the action is positive in either direction. That is to say, when the dynamo develops a current in excess of that of the battery, a connection is made, but should the contacts stick or fail to break for any reason, when the output of the generator falls, the reversal in the direction of the current in the cut-out coils breaks the circuit magnetically. A volt-ammeter is included, also option of a multiple switch or individual units. Fuses are employed in each lighting circuit.

#### **Polkey-Jarrott.**

In the Polkey-Jarrott system a centrifugal governor is utilized, but it is employed somewhat differently than in standard types of dynamos, it preventing the discharge of the cells through the armature when the dynamo is not developing sufficient current to overcome the resistance of the battery. The output of the generator is controlled electrically, a third brush collecting current which is utilized to regulate the strength of the magnetic field, and it is claimed for this system that instead of increase causing greater heating it actually runs cooler at high ratios. A charging switch is included with other members and the ammeter is illuminated at night by a small lamp in series with the tail light.

#### **Trier & Martin.**

Choice is given with the Trier & Martin of an electrical or a purely mechanical cut-out. A small flywheel on the armature shaft rotates in mercury contained in a shallow trough; throws the liquid tangentially up the side of the bath, the height attained being dependent on the speed of the wheel, and contact is made between the dynamo and battery only when a predetermined speed has been reached, the mercury touching a contact device.

The dynamo is of the shunt wound type, having four brushes equally spaced around the commutator. Two are positioned as usual, and to them are connected, through suitable resistance, one each of the other brushes. Excitation of the field magnets is by the main brushes, the auxiliary members and their resistance being employed to control the output, which is automatically regulated and within a wide range of speed.

The operation is as follows: Upon the armature beginning to revolve residual magnetism causes a small current to flow around the windings of the field magnets, building up the shunt field, and, since each main brush is connected to an auxiliary member through a resistance, current will also flow through it, also the conductors of the armature lying between the connected brushes, producing a magnetic flux in the armature parallel to a line connecting a main and auxiliary brush, tending to strengthen the main field.

Increase of speed up to a certain point results in no other effect than an increase in the magnitude of the forces, the point being when the speed is high enough to generate the line voltage between the main brushes, and represents the cutting-in speed of the machine. Additional speed produces an armature reaction which displaces the axis of the field forward and has the effect of reducing the current in the resistances between the main and auxiliary brushes. This continues until the axis of the field is displaced by 45 degrees, when no electricity will flow, as both main and auxiliary brushes will be at equal potentials. With further increase in displacement

of the axis of the field, current will again begin to flow between the main and auxiliary brushes, but in the reverse direction, weakening the field and making the dynamo self-regulating. The current flowing in the resistances is in the same direction as the main, so that at high speed the auxiliary brushes supply part of the main current and by suitable design can be made to carry half of the entire load.

The maker states that the rise in temperature at full load is small, owing to the armature coils between the main and auxiliary brushes being practically idle. The dynamo is attached to a small platform, upon which it slides, and adjustment of position is by means of a screw member. The platform may be fitted to either the top or bottom of the generator. Control of the lights and charging is by rotary switches. A combined volt-ammeter is fitted.

## **INTERNATIONAL SWEEPSTAKES.**

### **Entry List Now Open for Fourth 500-Mile Event on Indianapolis Speedway.**

Although the entry list for the third annual international sweepstake 500-mile race on the Indianapolis motor speedway was not opened until Jan. 1, 1913, the management has decided it is best to give manufacturers and individuals a longer time in which to make up their minds concerning the fourth event, which will be held Memorial Day, 1914. Entry blanks already have been sent out and the list will close May 1.

There have been several changes in the conditions governing the coming race. The entry fee has been reduced from \$500 to \$200, with the further stipulation that 50 per cent. of this fee will be refunded to all cars that start May 30. In order to insure the safety of drivers it has been ordained that all steering knuckles and tierods must be new two days before the starting of the race, while aluminum steering wheels will not be permitted. The frame hangers and steering mechanism shall be subject to the approval of the speedway's mechanical engineer, and cars failing to meet this approval will not be permitted to start. All drivers, including relief drivers, must furnish the referee with a certificate from the speedway surgeon, Dr. H. R. Allen, proving they are physically fit to engage in such a contest, and that they are entirely free from any serious nervous manifestations or other disorders which might prove a handicap.

The regular prizes will be the same as those of this year. A purse of \$50,000 will be offered, this being divided into 10 prizes, starting with \$20,000 for the winner. The Wheeler-Schebler cup will go to the entrant of the car which is first at 400 miles; the Prest-O-Lite trophy to the car in that position at 300 miles, and the Remy grand trophy to the machine which is first at 200 miles. The race is limited to cars the piston displacement of which does not exceed 450 cubic inches, and with a minimum weight of 1600 pounds.

## WITH THE CYCLECAR MANUFACTURERS.

### Constructional Details of Imp Two-Cylinder Roadster, Utilizing Specially Designed Friction Transmission---Features of the Little Princess.

**A**S PREVIOUSLY suggested in these columns, it is proving a difficult matter to differentiate between those machines which are described as cyclecars by their makers and those small cars which conform in many of their details to those which are classified as cyclecars but which their makers do not care to have termed thus. And in the absence of a definition which can be made to apply, it must suffice to state that there appears to be every evidence that the season of 1914 will witness the production of a large number of small cars selling at less than \$500. Most of these will be known as cyclecars, regardless of the term utilized by the maker.

While new cyclecar companies are being announced weekly, few of these concerns are as yet in a position to supply detailed information as to their product. Several have experimental machines on the road and changes in construction are being made as fast as the need for them is made apparent. Many of these concerns give no promise of being able to fill orders until next spring. The Automobile Journal hopes to present in this department constructional details and other information as early as it can be secured from the makers. It will be understood that, in some instances, further experimentation may disclose the need for additional changes and these will be presented in a similar manner.

#### THE IMP CYCLECAR.

The Imp Cycle Car Company, Auburn, Ind., appears to be closely related to the W. H. McIntyre Company, a concern which has been in the vehicle manufacturing business for 44 years, and which has experienced success in the production of both pleasure cars and motor business wagons. Experimentation in the cyclecar field has been under way for the past year and a half, and for some time one of these machines has been on the road. The company already has begun to make

deliveries on orders, and several agencies have been established. The cars are made in the McIntyre factory.

The Imp cyclecar follows rather closely the accepted design of this type utilized in France. The two-cylinder motor drives through a friction transmission and belt to the rear wheels, no differential being utilized. The machine seats two passengers, arranged in tandem. The wheelbase is 100 inches and the tread 36. The ground clearance is eight inches. The weight of the machine is 550 pounds, and the maximum speed 50 miles an hour. It is stated by the manufacturer that tests indicate that it will cover 50 miles on a gallon of gasoline.

The motor is a two-cylinder, air-cooled unit,

**Imp Cyclecar, Presenting the Seating Arrangement and the Main Constructional Features.**

with cylinders set at an angle of 45 degrees, rated at 10 horsepower at 1500 revolutions a minute and 15 at 2500. The inlet valves are mechanically operated. Cooling is accomplished with fins cast close together on the cylinders and exhaust connections. The cylinders both face the front of the car and the hood is so constructed as to permit air to be deflected around back of them. The carburetor is of the standard float type with compensating air valve, and the magneto a high-tension instrument. A piston pump is used to circulate oil through the engine. No cut-out is fitted.

The engine is started by turning a detachable crank inserted in the centre of the steering wheel. This crank connects with a shaft through the

Front Spring and Steering Arrangement on the Imp.

steering column, which communicates with a ratchet on the crankshaft by means of 3-1 bevel gears, spinning the motor three times faster than turned by hand. Compression in the motor is released automatically when the crank is inserted and applied as soon as the turning ceases, so that the operator does not turn the motor against compression.

The transmission affords four forward speeds and reverse. It is of the friction type. A special alloy disc is attached to the crankshaft, while the sliding member, or follower as it is termed, has a detachable paper friction ring clamped between two metal flanges. A lever fulcrumed about 1.25 inches above the centre line of the motor shaft operates against a trunnion housing which contains Radio thrust bearings. Two springs anchored on a flexible arm on the motor are attached to the upper end of this lever, which is controlled by pedal, and the spring tension is increased or diminished by a cam mounted on a shifting rod and pressing against a corresponding cam on the flexible arm, while the follower is moved across the motor disc. This action decreases the pressure between the friction wheels as the speed of the follower increases in an inverse proportion exactly, or vice versa, assuming that the motor is running at a fixed speed. Each speed is locked when set by the device connecting the shifting rod with the pedal.

In operating this mechanism, it is necessary only to press down the pedal which is connected with the lever, re-

leasing the friction surfaces, and set the speeds the same as in the sliding gear construction. A lever on the dash controls the cross movement of the friction follower and at the same time sets the springs for the proper tension. An arced plate on the dash registers the speed engaged.

Final drive is by a 1.125-inch V belt to the rear wheels. No axles are fitted, except, of course, the stub axles on which the wheels turn. Instead two flat springs are set crosswise of the frame and fastened at the ends to yokes, between which the wheel spindle is fitted; in front, to a pivoted steering knuckle, and in the rear, to a rigid arm. It is pointed out that as a result of this construction the only unsprung weight is the wheel weight. A hard wood V block attached to a lever on the radius rods and controlled by a pedal, is pressed into the rear pulley grooves, to act as a brake.

Steering is accomplished by a steering wheel in the centre of the car, the post running to the front and ending in a bobbin, around which run steel cables to the steering arms of the front knuckles, a spring keeping them taut as shown. A tierod across the front connects the arms.

Wire wheels are used with the spokes strung tangent. The rear pulley is riveted direct to the rim. Hubs have adjustable self-contained ball bearings. The tires are 28 by 2.5-inch clincher members, front and rear. There is space at the rear for tools, etc., and luggage. The standard equipment includes the starter, lamps and horn.

### THE LITTLE PRINCESS.

The Princess Cyclecar Company was organized recently in Detroit, with capital of \$200,000. The organizers include I. N. White, with 12 years of corporation financial experience; H. H. Dawson, expert cost accountant; C. J. Thornehill, for three years with the Wolseley and Sideley com-

Skeleton Side View of the Imp Model, Showing the Detailed Arrangement of the Components.

panies in England and formerly manager of Thornewill Bros., a British motor engineering concern; J. A. Martin, formerly draftsman and designer with the Oakland, Wagner electric and Chandler cars; E. H. Vincent, designer and engineer with 10 years experience with the Packard, Regal, Hudson and Cartercar machines, and H. L. Blydenburgh, formerly a designer and engineer with the Buick, Packard and Lozier companies. Temporary quarters have been secured in suite 1311, Dime Bank building, Detroit.

The company plans to manufacture three models, the Little Princess, a two-passenger roadster; a four-passenger touring car, and a light merchant's parcel car. All will utilize the same chassis. At present little more can be stated concerning the product than a recital of its specifications, although additional information is expected shortly.

The motor is a four-cylinder, four-cycle, air-cooled, L head unit, with bore of 2.75 inches and stroke of 3.675. The company maintains that it gives an actual horsepower of 12. The bearings are a high grade of nickel babbitt, and the crankshaft and connecting rods of drop forged high carbon steel. The one-piece camshaft is hardened and ground. Valves are large and of the mushroom type. The magneto is a high-tension Bosch, and the carburetor a Holley. Lubrication is by positive circulation. The engine starts from the dash.

The transmission is a planetary type, affording two speeds forward and reverse. The rear axle is of the bevel differential type and the front, tubular. Two sets of brakes are fitted. Springs are semi-elliptic in front and semi-transverse in the rear. The frame is channel section, strong and light.

The body is of metal and affords plenty of leg room. The passengers are seated side by side, the driver at the left. Bedford cord or leather upholstery and deep cushions make for comfort. The hood is of the sloping French type. Room for luggage is provided in the rear. The gasoline tank is under the dash and its capacity is five gallons.

Wire wheels are fitted, these being equipped with 28 by three-inch tires. The wheelbase is 86 inches, and the tread, 44. The weight is 600 pounds. The maker claims a fuel consumption of 40 miles to the gallon.

#### WANTS LIST OF MAKERS.

Will you kindly publish a list of American cyclecar makers?  
A SUBSCRIBER.  
Pittsburg, Penn., Oct. 1.

New cyclecar companies are being incorporated very rapidly, several of these being presented under the heads of New Incorporations each issue, but the following were organized previous to Oct. 1:

American Cyclecar Company, Equity building, Detroit; American Voiturette Company, Detroit; Blood Bros., Kalamazoo, Mich.; California Cyclecar Company, 818 South Main street, Los Angeles, Cal.; Continental Engine & Manufacturing Company, Minneapolis, Minn.; Davis Cyclecar Company, Detroit; De Cross CyCar Company, Galloway street, Cincinnati, O.; Detroit Cyclecar Company, 510 Free Press building, Detroit; Downing-Detroit Cycle Car Company, Detroit; Economycar Company, Indianapolis, Ind.; Falcon Cyclecar Company, Cleveland, O.; Fenton Engineering Company, Fenton, Mich.; Imp Cycle Car Company, Auburn, Ind.; Princess Cycle Car Company, 1311 Dime Bank building, Detroit; Ritz Cyclecar Company, 54 Wall street, New York City; Saxon Motor Car Company, 2609 East Jefferson avenue, Detroit; Twombly Motors Company, 258 West 69th street, New York City; Victor Motor Car Company, 371 Diamond street, Philadelphia; Zin Cyclecar Company, Rock Island, Ill.

Side View, Indicating General Design and Appearance of Princess Roadster.

The Woods Mobilette Company, Chicago, maker of the Woods Mobilette, described fully in the last issue of The Automobile Journal, states that the cyclecar it is now prepared to deliver will be equipped with a four-cylinder, 14 horsepower motor, instead of the two-cylinder, 10 horsepower engine utilized in the first machines produced.

The Importers' Automobile Salon, New York City, has decided to hold its annual display of foreign made cars in the Hotel Astor, Jan. 2-10, 1914. The date coincides with the showing of pleasure vehicles to be held by the Automobile Chamber of Commerce in the Grand Central Palace. The association has elected the following officers for the ensuing year: President, E. Lascaris, representing the De Dion-Bouton; vice president, T. Adams, Lancia; treasurer, F. Sewell, Minerva; secretary and show manager, Stefan Kjeldsen, Mercedes.

## MECHANICAL NOTES FOR OWNERS.

### Fitting a Shield to Protect Radiator--Method of Repairing Broken H Gate---Spark Plug Terminal Hint---Care of Rims--Packing Water Pumps.

**M**ANUFACTURERS of radiators lay great emphasis upon keeping the cooler clean and free from deposits of mud, dirt, etc., stating that the efficiency of these members is greatly reduced when their exterior is covered with foreign elements. It is not uncommon to note a machine with the radiator encrusted with dried mud, and sometimes after washing particles of dirt remain. The following contribution was received from a reader who states that he experienced considerable trouble from the motor overheating, and that by fitting a shield or pan, the radiator was not only kept clean, but the device improved the cooling system:

I am forwarding a rough sketch of a shield I fitted to my car, which is an old model, and perhaps the hint may be of service to some other motorist who is experiencing heating caused by an old radiator. The cooler is an old type and the fins are such that they fill easily with dirt, especially when it is muddy. I devised a shield or pan,

**Suggestion of Reader for Fitting Shield to Prevent Mud Splashing on Radiator, Which Is Stated to Improve Cooling by Deflecting Air Currents.**

which I made of enamelled leather, and fitted it as shown in the drawing. I secured the sides to the goose neck or frame extension and the back I bolted to the radiator hanger, the design making it a simple matter to attach. I found after trying the shield out that it had a tendency to blow upward, so this led to my making a rod, sewing the leather to it at the front and bolting the rod to the frame. I constructed this so that the shield was slightly lower at front and I believe that it deflects the wind onto the bottom part of the radiator. Anyhow, I am having better luck, as the motor does not heat as badly as formerly. Of course, the shield could not be fitted to every car as the starting crank might be in the way.

#### SPARK PLUG HINT.

The average owner when on a trip wears gloves when driving, and in the event of having to do some work, such as a minor adjustment, dislikes to remove the gloves, as water and soap are not always available for cleaning. The majority

of experienced motorists have, at some time or other, experienced the annoyance of dropping the terminal of a spark plug when replacing the plug or fitting a new one, and invariably the terminal will drop into the pan where it is not easily recovered. It is not an easy matter to catch the fine thread, especially with gloves on, although some makers of plugs recess the terminal so that it will start easily.

In an accompanying illustration is shown a simple method of making the threaded member "drop proof" by filing away two or three of the threads. The terminal will then slip on and catching the thread will be a simple matter. It requires but a few minutes to file the centre electrode, as shown in the drawing, and the hint will be appreciated if one has to change a plug on a day when the hands are benumbed by the cold.

#### REPAIRING JACK.

Many times jacks are discarded as worthless when a little work would make them as good as new. An instance of a high grade jack being thrown away by an owner because it did not operate properly, the head part continually sliding out when in the tool box and requiring much patience to replace it, was noted recently.

The motorist gave it to the garage attendant, who in a few minutes had it operating as well as ever. The side cover of the jack was removed and a pin fitted in the part that gave the trouble, a task that could have been performed by its owner had he been familiar with its construction. The pin is used to retain the sliding part, and sometimes these become bent through subjecting the jack to undue leverage. Sometimes the slipping or failure of the teeth to catch when raising the car is due to a loose screw. The mechanism of jacks is simple and aside from a broken part may be adjusted easily.

#### REPAIRING H GATE.

Careless operation or faulty material may be responsible for a broken section of the H gate, that member in which the speed change lever is moved. Sometimes the corners of the slots become badly worn, and bother the driver in making changes. An instances of a broken gate came

to the attention of the writer recently and the manner in which a repair was effected will be of service to those who may experience similar trouble. The material broke in making a change from high to second, a piece being detached and leaving the quadrant similar to that depicted at A in an accompanying illustration. The break is purposely exaggerated to explain the repair. As a new part would involve considerable expense the owner attempted to repair the member.

Spark Plug Hint.

He obtained a piece of hard brass .1875 inch thick and of suitable proportions, and fitted it to the gate as shown at B. Holes were drilled as outlined at C, the plate clamped onto the gate, and the gate proper marked. The plate was next removed and holes drilled and tapped in the gate member. By using flat headed machine screws, and countersinking these, the plate was not only held securely, but the job presented a neat appearance. The plate was smoothed up before the final fitting and care was exercised to be sure that it aligned with the part to which it was secured.

### GRAPHITE THE RIMS.

Although suggestions for cleaning and graphiting the rims have been made in these columns, there are many new owners who do not realize the importance of keeping the rims in first class condition. With the extra size tires being fitted, it naturally follows that blow-outs are not so common as formerly when the shoes were overloaded. While no one likes to change a casing until obliged to, the work will be made considerably easier if the rims are maintained in proper condition.

With the approach of fall weather with its rains, it is a good plan to remove the shoes, clean and graphite the rims or use a preparation containing this material. Mix oil and powdered graphite together, making a very thick paste. Next clean the rims, smoothing up any rough places that may exist, and apply the graphite freely. Rub off with a cloth, which will impart a bright finish, leaving a surface that will resist the action of water or moisture, and which will make changing tires an easy matter.

### CAUSE OF OVERHEATING.

An owner who possesses an old time car, which in spite of its age gives good service, was bothered one cool day by his engine becoming hot and the water in the radiator boiling. An examination showed that the cooler was filled and that there was plenty of oil in the crankcase. The pump shaft also rotated when the engine was turned over.

Deciding that the trouble must be in the pump, the owner disassembled this member and found that one of the gears was slipping on the shaft, the pin having become sheared off. Not having a drill to remove the broken pin, or a new pin, a repair was effected by roughening the surface of the shaft with a cold chisel, making a driving fit for the gear, which when replaced, held, enabling the journey to be completed.

### PACKING WATER PUMPS.

In renewing the packing in water pumps care should be taken to wind the material in the same direction that the shaft rotates. When candle wicking is utilized it is a good plan to soak it in a mixture of oil and powdered graphite, utilizing plenty of the latter. In adjusting the binding nut, do not set it up too tightly. It is best to operate the car for a day or so, then readjust the packing, as by this treatment there will be less danger of cutting the shaft.

### SOFTENING HARD WIRE.

If caught on the road without other than hard wire, and a piece of flexible material is needed, this may be made pliable by heating or annealing

Method of Repairing Broken Part of Speed Change Gate: A, the Broken Corner; B, Plate in Place; C, Plate Drilled for Fitting.

it in the flame of the headlights. The wire should be held with a pair of pliers to prevent the heat being communicated to the fingers.

## WITH THE MOTORING INTERESTS ABROAD.

### Two British Car Manufacturers Designing Alcohol Burning Engines—Peugeot Wins French Light Car Race—Interesting Motor Agricultural Implements.

**S**INCE Great Britain appears to be dependent upon outside sources for motor fuel, regardless of whether it uses gasoline, kerosene or benzol, it perhaps is not surprising to note that at least two British car manufacturers have commissioned engineers to design alcohol burning motors. This information was contained in a recent issue of the Commercial Motor, a British publication, but the statement did not include the names of the makers in question.

The subject is one which has been given attention by British automobile engineers for the past seven or eight years, largely because of the possibility of securing the desired fuel at home. Investigations and experiments were carried on previous to that time in an effort to learn the exact

in many respects a repetition of the Grand Prix, July 12. Georges Boillot in a Peugeot was the winner in both events, while his teammate, Jules Goux, was second. A Sunbeam was third in both instances, Chassagne being at the wheel in the Grand Prix, and Lee Guinness in the small car event. The Grand Prix covered 569 miles, while last month's race was for 387 miles. The latter contest was limited to cars of 183 cubic inches piston displacement.

Two American cars, Buicks, were entered in the small car event. These and two Sunbeams, one driven by Chassagne, and a Vauxhall withdrew before the completion of the race. The Vauxhall went out during the last round of the course, which measured about 32 miles. The following table gives the final results:

| Car        | Driver   | Time    | M.P.H. |
|------------|----------|---------|--------|
| Peugeot    | Boillot  | 6:07:04 | 63.2   |
| Peugeot    | Goux     | 6:16:03 | 61.7   |
| Sunbeam    | Guinness | 6:18:05 | 61.4   |
| Vauxhall   | Hancock  | 6:58:18 | 55.3   |
| Peugeot    | Rigal    | 6:59:44 | 55.2   |
| Alda       | Tabuteau | 7:52:34 | 49.0   |
| Anasagasti | Avary    | 8:07:25 | 47.0   |

#### FOR THE SMALL FARM.

#### Some Interesting New Agricultural Motors Brought Out Recently in France.

Eugene Bauche et Cie, Le Chesnay, France, displayed three new agricultural motors at the recent international exhibition in Soissons, which will prove of interest to motorists generally, because of the fact that each is designed to take the place of a single horse on the small farm. Two of these are hoeing machines and the third a mower.

The larger hoeing machine is propelled by a single-cylinder, four horse-power motor, driving the two main wheels in front. The engine is air-cooled by means of a rapidly rotating fan, so encased as to deflect the currents of air around the cylinder. The final transmission is by means of pinions and internally cut gear rings, and the whole of the transmission mechanism is encased and protected from dust and dirt. The rear of the machine is carried on a single trailing wheel, and between this and the engine are two transverse shafts, to which are attached the four hoes.

**Bauche Mowing Machine, Utilizing Single-Cylinder Motor.**

results to be obtained from its use. The increasing price of gasoline has had its effect in bringing about the present situation, and it would appear from such information as is obtainable on this side that the motoring public in Great Britain is demanding that the industry shall give the subject still more serious consideration.

#### PEUGEOT WINS AGAIN.

#### Boillot and Goux Finish First and Second in Small Car Race in France.

The running of the so-called French small car race over the Boulogne circuit, Sept. 22, was

By means of an eccentric and rod these are given a reciprocating or striking action when the machine is in motion. The smaller hoeing machine is similar in every respect, with the exception that its engine develops but 2.75 horsepower.

The Bauche mower has a single-cylinder motor rated at three horsepower, placed with its crankshaft parallel to the main axle. The drive is taken by means of spur gearing to a shaft on the right of the engine and carrying the clutch, which when engaged transmits the power to the right hand main wheel by spur gearing. By means of other spur gearing the left hand wheel is made to drive a pair of bevels which rotate shafts leading forward and terminating with a disc and crankpin, to which a rod is connected and made to actuate the usual form of cutter bar arranged at the extreme right of the vehicle. This cutter bar is hinged so that it may be elevated to a vertical position when not in use. The machine is guided by a pole at the rear, fitted with two handles, between which is fixed a hand lever for operating the clutch. In front a simple form of mechanism permits the cutter bar to be raised or lowered as required.

Shown in connection with the Bauche machines was a potato planter, and while definite information is lacking as to the motive power for this, it is assumed that provision is made for attaching this to one of the other vehicles. The operator of the planter has a seat at the rear, handles in front to guide the machine and a lever at the right to actuate the mechanism arranged to drop the potatoes at stated intervals. Directly in front of the distributing tube is a plowshare, which digs the necessary drill, and immediately behind the tube are two hoes, so arranged that the potato is covered automatically.

#### NEWS FROM FOREIGN LANDS.

A cablegram from London, dated Oct. 1, states that a 30 horsepower car (name not given) covered 1078 miles,

460 yards, on the Brooklands track in 12 hours, creating a new world's record.

The African World is authority for the statement that motor cars and motorcycles are being imported in increasing quantities into Nyassaland, the value for the last financial year being about \$60,000.

John L. Poole, resident export manager of the Hupp Motor Car Company in Paris, asserts that the United States will export 50,000 motor cars during 1914, and that 75 per cent. of these will be produced in Detroit.

The chamber of commerce at Oppeln, Germany, reports that the annual production of benzol at present is between 150,000 and 180,000 tons, and that this is to be increased very materially by the construction of a large number of coke ovens.

According to a correspondent for the Autocar, a British motoring print, a motorist in Liverpool recently was somewhat mystified because his engine refused to start, although a superficial investigation, with one side of the hood raised, failed to reveal any defect. Upon cranking the machine he was startled to hear a plaintive cry, apparently from the interior of the engine, something to which he was not accustomed, although it is explained that the machine was a Singer. Further investigation,

The Larger Bauche Hoeing Machine and a New Automatic Potato Planter.

the other side of the hood being lifted, discovered a kitten seated on the magneto in such manner as to establish a short circuit. The correspondent fails to offer an explanation as to how the kitten found its way to this unusual position.

The Swiss government bureau of statistics announces that at the beginning of the present year there were 4665 privately owned motor cars in Switzerland, of which 1629 were of Swiss construction. Of the remainder, 1550 were French, representing 26 different makes; 476 German, 11 makes; 282 Italian, five makes; 100 Belgian, two makes; 62 American, two makes; 11 British, one make. This leaves 555 cars the maker of which appears to be unknown.

According to the report of Consul George H. Pickerell, stationed at Para, Brazil, the present low price of rubber is tending to restrict shipments from the Amazon valley, many producers refusing to send down their supplies. Shipments through the ports of Para, Manaos, Iquitos and Itacoatiara to the United States and Europe during the month of July (the first month of the 1913-14 rubber season) amounted to only 4,189,454 pounds, in contrast to a total of 5,627,602 for the corresponding month in 1912.

## DETAILS OF VULCAN "27" TOURING CAR.

**S**UPPLEMENTING the announcement of its speedster model, the Vulcan Manufacturing Company, Painesville, O., presents particulars of its five-passenger touring car which sells for \$100 more than the first named machine. With the exception of the wheelbase, which is 115 inches, and heavier springs and parts caring for the added weight, the chassis is practically the same for both. The lines of the new model are extremely graceful and its appearance is further enhanced by clean running boards.

The motor is of the four-cylinder, L head type, with the cylinders cast en bloc, and has a bore of 3.375 inches and stroke of five. The rating of 27 horsepower is said to be very conservative. Throughout the proportion of components is liberal, the bearings, crankshaft and camshaft

transmission is of the selective type, providing the three conventional forward speeds and a reverse, with direct drive on the third. The gears and shafts are large, carefully cut and heat treated with the engaging gears chamfered to provide easy and quiet engagement. The change speed lever is set in a ball and socket below which is the H cast in the transmission housing, and the lever is of the cane handle type surmounted by an aluminum ball conforming to the shape of the palm of the hand.

The front half of the housing of the universal joint is cast integral with the rear section of the transmission case, and with the pressed steel cap which is bolted to it, forms the socket for the ball, a drawn steel part pressed and riveted to the end of the torsion tube. The two yokes and centre piece constituting the universal joint are heavy drop forgings having large bearings and the maker lays great emphasis on the construction, stating that lost motion after considerable service is positively avoided.

The rear axle is full floating type, weight of car being carried on large ball bearings mounted on the tubular housing. All bearings are sufficiently large for service in chassis twice as heavy as the Vulcan. Five pinions, instead of two, three or four, are employed in the bevel gear type of differential, and it is held that the de-

sign adds considerably to the life of these parts. The pinions are nickel steel, phosphor bronze bushed, and revolve on a drop forged spider. The bearings between the live axle and the differential housing are 4.0625 inches in diameter and .625 inch balls are utilized. The rear housing is liberally ribbed, and a pressed steel cover, readily removable, provides for easy access to the mechanism, etc.

The springs are long, have ample clearance and are proportioned to provide easy riding qualities. The rear members are 46 inches long, 1.75 wide, and are secured to large spring pads by drop forged clips. The steel utilized is a special alloy, very flexible, but tough. The spring eyes are bushed with Tobin bronze and the bolts are ground carefully to size and provided with grease cups.

The main driving gear and pinion are in keep-

**Vulcan "27" Five-Passenger Touring Car, Having 115-Inch Wheelbase, Attractive Lines and Full Equipment.**

being of ample dimensions. Lubrication is by a combination of the positive feed and constant level splash type, a plunger pump forcing the oil from a six-quart reservoir. The carburetor is a standard make, supplied with hot air from the exhaust manifold, and ignition is by a true high-tension magneto mounted on a bracket cast integral with the crankcase. Cooling is by thermosyphon, aided by a 12-inch fan, and the water pipes and jackets are of very liberal dimensions.

The motor, clutch and transmission are a unit having a three point suspension, it differing from usual practise in that the rear cross member is bolted through the centre of the transmission casing, making for a sturdy construction. The clutch is a leather faced cone in which easy but positive engagement is emphasized, and it is held that it may be disengaged by a slight pressure, a feature which will appeal to women drivers. The

ing with the balance of the sturdy design. The main gear is machined from a solid drop forged ring of 3.5 per cent. nickel steel, and the pinion

**The Springs of the Vulcan Are Long and the Brakes Liberal in Size.**

from a solid bar of the same alloy. The teeth are planed with the Gleason gear tooth generator, insuring accurate proportions. The teeth have an 1.25-inch face, and those on the driving pinion are reinforced by an added brace running back .375 inch beyond the tooth on the gear hub. A large New Departure ball bearing is utilized immediately back of the driving pinion.

The brakes are large and the leverage of both sets is so proportioned that a gentle pressure is sufficient to stop the car. The service brake is of the external contracting type, operated by pedal, while the emergency is internal expanding, actuated by the conventional hand lever. Both brake bands are faced with asbestos. The drums are of pressed steel, securely retained.

The equipment is complete, including mohair top with side curtains and envelope, large sized gas headlights, Prest-O-Lite tank, oil side and tail lights, automatic windshield, speedometer, horn, full kit of tools, tire repair kit, jack, pump, etc.

The company calls special attention to its methods of manufacture, stating that its high grade product and low selling price is due to its production in large quantities. Considerable time was spent by the company in the preparation of special jigs, dies, tools and machinery which, with a small overhead expense, enable the production of parts and units in quantity without sacrificing quality. The inspection of each part entering into the chassis is extremely rigid and as a result all parts are interchangeable and do not require any machining, filing, etc., to fit. The company maintains its own foundry and every piece of material is carefully selected. Drop forgings are utilized wherever possible, and pressed steel

parts employed where lightness and strength are desirable. The selling policy, which is liberal, was outlined in The Automobile Journal in the issue of Sept. 10.

### TO REACH MOOSEHEAD LAKE.

#### Maine Automobile Association Advises State to Develop This Territory.

The Maine Automobile Association has taken active measures to bring to the attention of the new state highway commission the desirability of developing the Moosehead lake region. It suggests a highway from Greenville to Kineo Station, or from the so-called Quebec road to the latter point by way either of Parlin Pond or Jackman. It is stated that on either route the big lumber companies have built several miles of good road, so that there will be only from 15 to 18 miles of new construction.

It is maintained that the Moosehead lake region is to become one of the greatest pleasure spots in the entire state, as well as the scene of much business activity. At present, this greatest lake in the state, and one of the largest in the eastern section of the United States, has only one road leading to it, this being the one with terminus at Greenville Junction. The remainder of the miles of shore can only be reached by steamer from Greenville, and by one line of railroad at Kineo Station.

The C. A. Edgerton Manufacturing Company, Shirley, Mass., maker of President suspenders, has purchased six Overland cars, made by the Willys-Overland Company, Toledo, O., to be pre-

**Vulcan Rear Axle, Showing Pinion, Differential and Large Heavy Duty Bearings Employed.**

sented as prizes to the six jobbers disposing of the largest amount of this concern's product during a given period.

 gress of March 3rd, 1879.

---

**UNIFORM TRAFFIC RULES.**

---

The more general adoption of the automobile, both as a pleasure and a commercial vehicle, has brought about traffic conditions which are only just beginning to be appreciated by the public at large. That the swiftly moving mechanical conveyance adds a new element of danger has long been conceded, and determined effort has been made to reduce this danger to a minimum. Practically the first attempt to give the matter scientific consideration is found in the appointment of a committee for this purpose by the International Travel Club.

This committee, as is more or less well known, will not confine its investigations and recommendations to the use of highways by automobiles,

but the entire subject will be reviewed, including railway, trolley and steamship traffic. Men of prominence in various walks of life have been selected to act upon the reports of special investigators who are studying the problems presented both in this country and abroad. Naturally, the first attention will be given to the matter of congestion in the larger cities, but it is proposed to continue the investigation so as to cover the entire field.

The problems are somewhat numerous and varied. Certain conditions doubtless will be recognized as impossible of improvement. It is to be hoped, however, that the committee will have little difficulty in securing the co-operation of those upon whom will devolve the authority for enforcing the uniform traffic regulations which are expected to result from its deliberations. Law abiding motorists are quite as much interested in eliminating the dangers to which they, as well as other users of the highways, are subjected.

---

**OPINIONS CONCERNING THE TARIFF.**

---

Importers of automobiles, as represented by those with headquarters in New York City, appear to be highly pleased with the passage of the so-called Underwood tariff, which lowers the rate on chassis and parts from 45 to 30 per cent. ad valorem. In view of the fact that very few cars, selling either above or below \$2000, are imported with bodies, this portion of the new tariff bill undoubtedly will have little effect upon the industry in America. Importers declare that the new rate will have decided influence upon the importation of commercial vehicles, although it is difficult to understand at this time, just why this result is to be expected.

If the opinion of Detroit manufacturers may be taken as expressing that of the industry in this country, there does not appear to be any general feeling of unrest at this time. With but one exception representatives of the Detroit makers are quoted as saying that the new rate will have but little effect upon them, one way or another. The exception is that of a producer of popular priced cars, who looks for more or less depression in general trade conditions with a natural reaction on the motor car industry which only the future can reveal. Of course, it is much too early to forecast results as yet.

## NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

**Typhoon Horn.**

The Typhoon Signal Company, Chicago, announces a new type of Typhoon electric horn known as type F, and although it is a popular priced signal, it is covered by a very liberal guarantee. It is constructed in two styles. One has a six-inch projector for mounting on the outside of the car, and this model is finished in three styles, namely: All black enamel, nickel and black enamel, and brass and black enamel. The other type is made expressly to be placed under the hood and is fitted with a long projector to project the sound. It is finished in all black. It is stated that short circuiting is prevented by utilizing a 7.5-inch flexible tubular connection for the wiring to the horn, and the construction eliminates the conventional use of terminals for attaching the leads from the battery. The signal is designed to be operated on any standard six-volt battery, and full length wire cable and push button are included in the equipment. The tone is said to be clear and penetrating, but not discordant.

**Shiller Cigarette Holder.**

The Shiller Manufacturing Company, Chicago, is marketing a novelty termed the Shiller cigarette holder,

company states it produces an outfit to convert oil into electrical units, which permits use of its device. The rear light alarm comprises a compact, round, hard rubber box, containing an electro-magnet and a buzzer, the last named giving forth a strident sound when the filament of the tail lamp burns out or the circuit is broken. The box is provided with three terminals, one of which is connected directly to the battery, while the others are connected across the lamp terminals. A switch is also included. The device operates on a six-volt circuit and consumes practically no current as the buzzer may be cut out by the switch as soon as it sounds. The equipment comes packed in a neat box, and includes suitable length of wire, etc. It is moderately priced.

**Pioneer Batterymeter.**

Motorists who pay attention to details realize the importance of giving the storage battery utilized with lighting and motor starting systems that care that is necessary for maximum efficiency. While the condition of the cells may be ascertained by the use of a voltmeter, makers of batteries recommend testing the specific gravity of the electrolyte, and for this purpose a hydrometer is used, an instrument permitting of fine readings not

Typhoon Horn

Shiller Cigarette Holder

J-M Spark Plug

Rear Light Alarm

Pruden License Holder

Pioneer Batterymeter

Ideal Automatic Hose Attachment

which is a device that may be located in any desired position, either on the steering wheel or other convenient place on the car. The lower part of the holder is provided with a clamp for attaching to the steering wheel, for example, while the upper end clasps the cigarette.

**J-M Spark Plug.**

The H. W. Johns-Manville Company, New York City, is manufacturing a spark plug which carries with its sale a guarantee of 10,000 miles of service and the company states that any plug failing to give satisfaction will be replaced by a new one. One of the features of the J-M is the use of double insulation, it comprising mica and porcelain, the former being wound around the electrode. It is stated that the dual insulation, either of which is sufficient to insure perfect sparking, will withstand high voltages. The J-M spark plug is made in all sizes; is adapted to either battery or magneto currents, and is moderately priced. The company issues a booklet on ignition which will be mailed upon request.

**Rear Light Alarm.**

The enforcement of the ordinances respecting the tail light has led to the marketing of a number of devices for notifying the driver when the lamp is extinguished and these are made both for electric and oil lamps. The Guaranteed Specialties Company, Kinney building, Newark, N. J., is manufacturing the rear light alarm, which is designed for electric lighting equipments, although the

possible with the voltmeter. The Northwestern Chemical Company, Marietta, O., manufactures several types of instruments for this work and the Pioneer batterymeter No. 1 is shown in an accompanying illustration. It comprises a hydrometer enclosed in a sturdy glass tube and the electrolyte is drawn into the device by a rubber bulb. A suitable snout for inserting through the opening in the cells is also incorporated. The Pioneer batterymeter is nicely made and is guaranteed to be accurate in its readings.

**Pruden License Holder.**

The laws of many states require that the car license be carried either in the machine or upon the person. When it is carried in the clothing and this changed, one is likely to forget to transfer it. The W. E. Pruden Hardware Company, 260 West 52nd street, New York City, is marketing the Pruden license holder, comprising a metal case so constructed as to retain the license and protect it from injury. The holder is fitted with a Corbin lock and an extra key is included.

**Ideal Automatic Hose Attachment.**

There is no doubt that the water wasted in washing motor cars represents a large sum. Many owners and chauffeurs allow the water to run when cleaning the machine, by dropping the hose instead of shutting off the supply until again needed. The Gaylord Sanitary Manufacturing Company, Rochester, N. Y., is marketing the

Ideal automatic water saver attachment, which is stated will earn its cost in 30 days where metered water is used. The device is secured to the conventional hose and is equipped with a lever which normally shuts off the supply when pressure is released. Being very compact and designed to fit the hand, it is a simple matter for the operator to compress the lever, which action allows the water to flow. A spray or jet nozzle is included, making it possible to vary the size of the stream and according to the character of the work. The Ideal comes in polished brass or nickel plated and is not expensive.

#### **Avery Electric-Acetylene Burner.**

P. C. Avery, president of the Acetylene Gas Company, Milwaukee, Wis., has brought out an auxiliary or emergency burner for electric lighting systems, permitting the use of acetylene in the event trouble is experienced with the lighting equipment. The new device comprises an acetylene burner, which may be fitted into the electric lamp socket by removing the bulb. The gas burner is connected to an auxiliary gas tank by a tube leading out through the front of the electric lamp. The glass cover is removed when the burner is in service, making it unnecessary to drill a special hole in the lamp as a lead for the tube. It is claimed that the flame will not blow out in the strongest wind. The device is inexpensive.

#### **Mosler Silent Knight Plug.**

Spark plug construction and location are being given more attention by engineers than formerly, and, coupled with the high efficiency of the magneto, ignition troubles are reduced to a minimum. A. R. Mosler & Co., Mt. Vernon, N. Y., produces a large variety of spark plugs to meet the varying requirements of different motors and in an accompanying illustration is shown the Mosler Silent Knight plug, which embodies the well known Split-fire characteristic, namely, the protected central electrode. The plug is constructed to operate satisfactorily in splash of oil and to fire accurately under compression. It is constructed in metric sizes, platinum pointed, also in a 7/8-18 open end, two point type. Both are designed to withstand high voltages and the burning effect of magneto currents.

#### **Hi-Po Spring Battery Connector.**

Loose dry cell battery terminals are annoying and with ordinary members care must be exercised in tightening else the battery terminal will be broken. The Hi-Po Waterproof Battery Company, 1007 Atlantic avenue, Brooklyn, N. Y., is marketing the Hi-Po spring battery connector, which is stated to be self-locking. It is attached with the fingers, and it is also claimed that it will not jar or loosen in service. Another advantage pointed out in the design is that a perfect contact is obtained thereby increasing the efficiency of the cells. A feature of the terminal employed is that the wire may be secured without soldering, a patent tie making a perfect electri-

cal connection. The construction and method of attachment to a cell is made clear in an accompanying illustration.

#### **Utility Blow-Out Sleeve.**

The Utility blow-out sleeve is produced in several forms by W. L. Johnson & Co., Endicott, N. Y. That illustrated is termed style D and is constructed from a one-piece heavy chrome split leather and is provided with an additional tread thoroughly studded. The last named feature prevents skidding. This type of sleeve does not require straps or laces, hooks fitting the rim. It is claimed that the sleeve cannot creep as it is held securely by inflating the tire. The leather is soft and pliable and is held to be water proof. The Utility blow-out sleeve is made in lengths varying from six to 12 inches and in sizes from three to five inches.

#### **A. A. S. Fibre Tubing.**

Hard vulcanized fibre tubing is employed for a large number of useful purposes, such as carrying the high-tension leads, wiring electric lighting systems, socket linings, bushings, etc. Being very tough and durable it can be forced in place without danger of breakage and it also may be machined and cut easily. The American Auto Supply Company, 1741 Broadway, New York City, and 1408 South Michigan avenue, Chicago, is marketing a hard vulcanized fibre tubing which comes in 24-inch lengths and has inside diameters of 1.125 and 1.5 inches. The thickness of the walls is .09375 inch. The net weight of each tube is 20 ounces. It is inexpensive.

#### **Blazer Horn.**

The Motor Specialties Company, Waltham, Mass., is marketing a new exhaust operated horn, which is not only moderately priced, but may be attached easily and without alterations to the exhaust pipe or muffler. It is secured to the exhaust pipe by a special clamp and may be locked with a screw driver. The horn proper is stationary and one of its features is that the tubes extend toward the front of the car, insuring an efficient signal even when the motor is operating slowly. The gases are deflected to the tubes by a simple lid device which does not impede the egress of the gases, thereby eliminating opportunity of purring noises when the horn is not being utilized. The construction is simple and high grade throughout and the maker states that it will not clog. It is designed especially for model T Ford automobiles.

#### **The-Tell-Tale Gasoline Gauge.**

The Bundy-Goebel Manufacturing Company, Detroit, Mich., is producing an ingenious device for indicating the amount of gasoline in the fuel tank. The Tell-Tale gauge is not only compact, but it is stated that it may be fitted to the fuel container in less than two minutes and that after installation requires no attention. One of the features of the device is that the tank may be filled with-

out disturbing the gauge, a filler cap of neat appearance being provided. The gauge is oval, one section comprising a calibrated face, over which moves an indicating hand. As the gauge may be placed in plain view, as with a roadster type of car, the driver may ascertain the amount of fuel on hand from the seat by simply turning his head. The Tell-Tale is constructed for various types and makes of machines, including roadsters, runabouts, touring, etc., and is inexpensive.

#### Shino Mitten Duster.

The Pioneer Manufacturing Company, Cleveland, O., is marketing the Shino mitten duster, which is formed to fit the hand and to make easy the cleaning and polishing of the upholstery and body of the motor car. The duster is chemically prepared, and it is claimed that it will absorb all dust and that the texture of the material is so fine and soft that it will not scratch the finest of surfaces. It is also stated that crevices in the upholstery, where dust collects, are reached easily.

#### Radio-Escape.

The Radio-Escape, so named because it is designed to prevent evaporation of the fluids utilized in the radiator, is manufactured by the Globe Machine & Stamping Company, Cleveland, O. It is made in two styles, that illustrated being known as B, and is adapted to any type of radiator cap. It is fitted by tapping and drilling a hole and it is stated that the device is entirely automatic in its action. By its use it is claimed that evaporation is held to less than a quart for an entire season, and that it makes for economy when alcohol or other antifreezing solutions, subject to evaporation, are employed. Type A is made for new cars.

#### Weld Extra Jet.

The Weld Manufacturing Company, North Chatham, Mass., announces the Weld extra jet, which is designed to make starting of the car easy in cold weather as well as to eliminate the trouble of priming the cylinders. The entire operation is controlled from the seat, a small, compact lever being utilized, which may be operated by the foot. The principle of the device is that of providing a rich mixture to the cylinders for starting and operation until the motor has become sufficiently warm to operate efficiently under the normal mixture. The Weld differs from the usual types of priming devices in that the fuel is completely vaporized, properly mixed with air and conveyed to the intake manifold in proximity to the cylinders, thereby eliminating opportunity for condensation or precipitation through long contact with the cold metal walls of the induction pipe. The extra jet takes gasoline from the float chamber of the carburetor, and, as the opening is above the fuel level of the float, leakage is not possible. The size of the extra jet is approximately .75 by 3.5 inches. Connection from the jet to the actuating handle is by means of a small brass chain. It is stated that it is attached without soldering, only two small holes being required for an .125 inch pipe. In addition to mak-

ing for easy starting it is pointed out that the adjustment of the carburetor will not require changing to enrich the mixture for cold weather starting.

#### Peerless Steam Pad Vulcanizer.

The Peerless steam pad vulcanizer is produced by the Leader Manufacturing Company, 3049 West 25th street, Cleveland, O. Its face is concaved to conform to the outline of the casing and suitable side brackets are provided for the tension chain, which is secured by eye bolts locked with wing nuts. It is stated that it will vulcanize a patch on a tube or casing from a puncture to a patch nine square inches. It takes but two to five minutes' application of the hydrocarbon heater to generate sufficient heat to vulcanize thoroughly and a water pad automatically prevents burning either the patch or surrounding rubber. The equipment includes suitable material to make repairs to tubes and casings. It is moderately priced.

#### Wade & Fisher Foot Stirrup.

Wade & Fisher, 3807 Lake avenue, Chicago, is introducing the Wade & Fisher foot stirrup attachment, which is a practical device and one designed to save considerable labor when a wheel must be jacked up to change a tire or for other work. It comprises a metal stirrup, shaped to conform to the foot and having a flexible band at the top. This band is utilized to prevent the foot from slipping when the handle of the jack, to which the device is clamped, is moved upward. The clamp is so constructed that it will fit any type jack handle and as the stirrup swivels it may be permanently attached. To operate, the foot is placed in the stirrup, enabling operation of the jack without stooping and soiling the clothing.

#### Liberty Bell.

The Liberty bell, manufactured by the Liberty Bell Company, 346 The Arcade, Cleveland, O., differs from the usual electric signalling devices in that it is an actual bell having a tongue actuated on the current of four standard dry cells. It is five inches high, five across the base, and can be mounted on any convenient place on the car, and being surmounted by an eagle, presents an attractive appearance. The tone is said to be unusually pleasing and effective, being distinct but mellow. It is stated to be water, dust and fool proof and a suitable length of cord and switch accompany each signal. The construction of the bracket is such as to make for easy installation.

#### Shawver Storage Stands.

The Shawver Company, Springfield, Mass., is manufacturing the Shawver storage stands, which are moderately priced and designed especially for service when the car is stored for the winter. They come in sets of four and are placed under each axle of the machine, relieving the tires of all weight. Each stand has a suitable, substantial base, and by means of a screw thread arrangement may be adjusted to various heights. It is not necessary to jack up the car as the stands are operated easily.

## IMPROVED ROADS AND MOTORING LAWS.

### Tariff Is Reduced on Automobiles and Motorcycles--Half of the Lincoln Highway Money Is Already Subscribed--How Colorado Funds Are Distributed.

CONGRESS appears to have given but little heed to the representations of the motor car industry in the final draft of the so-called Underwood tariff bill, which became a law upon receiving President Wilson's signature, Oct. 3. In its original form, the rate on completed automobiles and chassis was placed at 45 per cent., as under the so-called Payne tariff. Parts, excepting tires, were listed at 20 per cent.

The industry maintained that this virtually provided a tariff of 20 per cent. on automobiles, since very few complete cars were imported and it would be possible to import chassis parts and assemble them on this side. As a result of these representations cars and bodies were left at 45 per cent. and chassis and parts were placed at 30 by the House. The final draft was prepared in conference and reads as follows:

Automobiles, valued at \$2000 or more, and automobile bodies, 45 per centum ad valorem; automobiles, valued at less than \$2000, 30 per centum ad valorem; automobile chassis and finished parts of automobiles, not including tires, 30 per centum ad valorem.

It would appear that this had the effect of reducing the tariff on automobiles to 30 per cent., if the reasoning of the industry's representatives were to be accepted. And this rate actually is made to apply to cars valued at less than \$2000.

The old rate on motorcycles was 45 per cent., and the original Underwood bill fixed this at 40. The final draft, which reads as follows, does not appear to give this branch of the industry as much protection as was at first intended:

Bicycles, motorcycles and finished parts thereof, not including tires, 25 per centum ad valorem.

---

#### LINCOLN HIGHWAY FUND.

---

#### Treasurer Reports That Subscriptions Now Total More Than \$5,000,000.

---

Half of the money needed to insure the construction of the concrete road from New York to San Francisco, to be known as the Lincoln highway, has been subscribed, according to the report of Treasurer Emory W. Clark of the Lincoln Highway Association. This means that the pledges now total more than \$5,000,000, and the officials of the association feel certain that the

grand total of \$10,000,000 will be reached before July 1, 1914.

The route, announcement of which was made in the last issue of The Automobile Journal, will be dedicated by formal exercises at various points between the two coasts on the night of Friday, Oct. 31. The arrangement of programme will be left to the local committees in the several centres, and it is understood that in many of the smaller towns and villages along the way there are to be torchlight parades, in which wagons, farm machinery, automobiles, motorcycles and other conveyances will appear.

At these meetings plans to rename each section of the Lincoln way will be broached. Local designations are to be dropped. Markers, each consisting of a strip of red three inches wide, white 15 inches in width and a blue strip three inches wide, with a letter L in blue on the white section, are to be set up all along the way from coast to coast. The first of these was placed at Clinton, Ia., Monday, Sept. 15, by W. F. Coan, president of the Clinton National Bank, and state consul for Iowa. Such consuls are to be appointed in each state, with authority to name deputies for the purpose of soliciting individual subscriptions for the project.

---

#### COLORADO'S LICENSE FEES.

---

#### How Money Received from Automobile Owners Is Distributed for Good Roads.

---

Secretary of State Pearce has made his first accounting under the new automobile law, which went into effect in Colorado, July 15. It may be pointed out, of course, that hardly more than two months have elapsed since the first license fee was collected, but it must be assumed that practically all of the cars owned within the state have been accounted for in the reckoning. The total of fees collected during this period, these being for registering cars and motorcycles and licensing drivers, was \$54,310.50. The expense of operating the new department has figured out at about eight per cent., although it is expected that this will be reduced to nearer six per cent. next year.

Under the provisions of the new law, half of the net revenue (in this instance, \$24,998.35) is

turned over to the state highway commission, while the remainder is distributed among the counties, in the proportion indicated by the amount of fees collected from each. This is assumed to be a fair method of distribution, at least in theory, but the way in which it works out in practise is indicated by the following table:

| County              | Received           | Returned           |
|---------------------|--------------------|--------------------|
| Adams .....         | \$445.00           | \$208.41           |
| Arapahoe .....      | 333.00             | 147.29             |
| Archuleta .....     | 65.00              | 28.64              |
| Baca .....          | 32.00              | 11.89              |
| Bent .....          | 386.50             | 173.64             |
| Boulder .....       | 1,722.50           | 762.62             |
| Chaffee .....       | 476.00             | 217.16             |
| Cheyenne .....      | 132.50             | 61.63              |
| Clear Creek .....   | 113.00             | 51.06              |
| Conejos .....       | 503.50             | 227.35             |
| Costilla .....      | 226.00             | 105.35             |
| Crowley .....       | 313.50             | 144.10             |
| Custer .....        | 72.50              | 32.23              |
| Delta .....         | 603.00             | 261.54             |
| Denver .....        | 21,581.00          | 9,972.23           |
| Douglas .....       | 161.50             | 71.93              |
| Eagle .....         | 63.00              | 28.43              |
| Elbert .....        | 151.00             | 68.12              |
| El Paso .....       | 4,389.50           | 2,047.90           |
| Fremont .....       | 1,166.00           | 540.99             |
| Garfield .....      | 309.50             | 140.85             |
| Gilpin .....        | 13.50              | 5.82               |
| Grand .....         | 52.50              | 22.69              |
| Gunnison .....      | 190.00             | 86.86              |
| Hinsdale .....      | 7.50               | 2.94               |
| Huerfano .....      | 196.00             | 86.54              |
| Jackson .....       | 47.00              | 20.40              |
| Jefferson .....     | 590.50             | 274.07             |
| Kiowa .....         | 156.50             | 71.26              |
| Kit Carson .....    | 242.50             | 108.68             |
| Lake .....          | 116.50             | 51.47              |
| La Plata .....      | 335.00             | 154.86             |
| Larimer .....       | 3,191.00           | 1,491.13           |
| Las Animas .....    | 1,025.00           | 473.39             |
| Lincoln .....       | 269.00             | 122.86             |
| Logan .....         | 885.00             | 407.56             |
| Mesa .....          | 725.50             | 326.75             |
| Mineral .....       | 29.00              | 12.69              |
| Moffat .....        | 74.50              | 14.18              |
| Montezuma .....     | 163.50             | 72.89              |
| Montrose .....      | 457.50             | 207.41             |
| Morgan .....        | 892.00             | 418.50             |
| Otero .....         | 1,490.00           | 691.06             |
| Ouray .....         | 47.50              | 20.64              |
| Park .....          | 167.50             | 74.45              |
| Phillips .....      | 378.50             | 169.10             |
| Pitkin .....        | 62.00              | 28.67              |
| Prowers .....       | 679.50             | 304.83             |
| Pueblo .....        | 2,404.00           | 1,104.53           |
| Rio Blanca .....    | 56.50              | 25.29              |
| Rio Grande .....    | 695.50             | 316.14             |
| Routt .....         | 158.00             | 71.25              |
| Saguache .....      | 297.50             | 132.38             |
| San Juan .....      | 2.50               | .75                |
| San Miguel .....    | 37.50              | 16.72              |
| Sedgwick .....      | 258.00             | 116.50             |
| Summit .....        | 33.00              | 14.22              |
| Teller .....        | 735.50             | 345.25             |
| Washington .....    | 273.50             | 123.93             |
| Weld .....          | 3,190.00           | 1,487.92           |
| Yuma .....          | 439.00             | 199.01             |
| <b>Totals .....</b> | <b>\$54,310.50</b> | <b>\$24,998.35</b> |

It will be noted that Denver county contributed approximately 40 per cent., and about 19 per cent. of the total is returned to it. The motorists of that county therefore pay a little better than 20 per cent. of this fund available for good roads work throughout the state, although,

of course, the state highway commission may decide to spend any portion of its share of the total sum it desires in Denver county. On the other hand, it would appear that many counties receive but little direct benefit from the distribution, and must depend very largely upon the state highway commission for funds. This applies particularly to San Juan county, which is in size about equal to half the State of Rhode Island, and which receives 75 cents as its share of the automobile money.

### WANTS STILL MORE ROADS.

#### Would Connect South and Southwest with the Rest of the Country.

While it lends its unqualified indorsement to the Lincoln Highway project, the Manufacturers Record, Baltimore, Md., a trade publication devoted to the industrial, financial and general business interests of the South and Southwest, presents an editorial argument for a highway of similar character connecting the North and West with the South and Southwest. It suggests that the interests of these sections are such that a highway of this character would make possible material development and increase business to such an extent as to make it worth many times the cost.

Its plan is to have a road, built of the best materials obtainable and open for travel at all seasons of the year, running from New York to Florida, thence along the Gulf to New Orleans, there to connect with another highway from the Central West, and continue into Texas. It maintains that if men of the highest financial and business standing in the South, men who have achieved great things in other undertakings would formulate such a plan and push it with the vigor exemplified by the Lincoln Highway Association, it would be found that the very interests which are contributing so liberally to that project would contribute with equal liberality to the new proposition.

The United States Department of Agriculture has recently issued, as bulletin No. 23 of the new departmental series, a contribution from the office of public roads on vitrified brick as a paving material for country roads. The materials used and the process of manufacture are described, as well as methods of testing the bricks. Special attention is directed to the importance of proper engineering supervision.

## CORRESPONDENCE WITH THE READER.

### Rewiring Model T Ford.

(1653)—Am planning to rewire my model T Ford as the old wires are covered with oil and those on the timer are in bad shape. The timer is hard to get at, unless the radiator is taken off and I do not wish to do this. As the wires leading to it run through a tube I am afraid to tackle the job without a wiring plan and some help. A friend of mine stated you published a drawing some time ago showing how the work is done. If it would not take up too much of your valuable space and time I would appreciate a few suggestions on the work.

JOURNAL READER.

Shannock, R. I., Sept. 29.

The drawing referred to was published some time ago and it dealt with locating ignition troubles, although the wiring plan was shown. It is reproduced at Fig. 1 and it will be noted that the primary and secondary wiring plan is also depicted.

The rewiring may be accomplished without

cells may be utilized with a lamp or bell. Connect the end of one wire to the carbon of the cells and the lamp or bell to the zinc. By taking each wire and touching the free end to the lamp, for example, it will light when the proper wire is used, as it completes the circuit. The wire can then be marked. The other wires may be tested similarly.

Attach the wires to the timer as shown in the drawing, which indicates the direction of rotation of the shaft; in this instance, anti-clockwise or to the left. Replace the timer, insert pin and lock with nut. The wiring of the secondary leads is simple and as these are numbered in the diagram, no difficulty should be experienced in the work. The coil is shown at B and no attention should be

Fig. 1—Showing Wiring Plan of Model T Ford, Direction of Rotation of Commutator Shaft and Firing Order of the Motor.

trouble by studying the diagram and ascertaining the firing order of the motor, which is 1, 2, 4, 3, beginning with the cylinder nearest the radiator. The timer is retained by a nut which, when removed, will enable the withdrawal of a pin or key. After displacing the last named member care must be taken not to crank the motor. Remove the timer and displace the primary connections.

Next, disconnect the wires at the primary terminals on the coil, and pull the leads from the tube. They will serve to obtain the dimensions required for the new wires. There are several ways of identifying which wire is which after the four have been drawn through the tube. One is to tag one end, marking it 1, 2, 3 or 4, as the case may be, and to tie a similar number of strands of white string on the other end. Or, dry

paid to the numbers as these were utilized to explain an ignition trouble.

### Cleaning Oil Sight Feeds.

(1654)—I have an oil sight feed on the dash of my car and there are five glasses through which the dropping of the lubricant may be seen, to regulate the supply. These glasses are hard to keep clean as you can't get a cloth in back of them. The garage man says not to take them apart as I would have trouble in getting them tight again. How do they clean them inside and out?

OWNER.

Taunton, Mass., Sept. 29.

The repairman gave good advice, as it is difficult for a novice to disassemble this type of oiler and replace the parts without leaks. To clean the glasses on the inside, disconnect the large tube carrying the lubricant into the feed members. It is best to disconnect it at the oiler proper and loosen the nut at the other end of the tube. Swing the pipe upward and squirt in gaso-

line. This will flush out the interior of the glass members.

At Fig. 2 is shown a method of cleaning the

Fig. 2—Illustrating Method of Cleaning Oil Sight Feed Glasses by Utilizing String.

exterior. Take a piece of soft cotton string or cord, pass it back and around the glass as shown at A, and by moving the hands back and forth the string will clean the glass very nicely. If the surfaces are covered with old oil, it is best to soften it with a little gasoline.

#### Adjusting Bosch Magneto.

(1655)—I purchased a second hand car some time ago and until recently it has been running good. It has two sets of ignition, batteries and a high-tension magneto, a Bosch. I am having trouble with the magneto and think it needs cleaning and probably some little adjustment. It is the kind having a three-arm or spider, and the breaker box has two circular extensions. Noting you advise your readers on repairs I trust you will give me instructions and illustrate the same if possible. NEW SUBSCRIBER. Lancaster, Penn., Sept. 27.

If the magneto has not been cleaned and the breaker points adjusted for some time, giving these members attention may cure the trouble. At Fig. 3 is shown the magneto referred to with the distributor and breaker box mechanism exposed. The last named parts are accessible by loosening the lock nut on the ground terminal member, and slipping to one side the flat spring holding the cover in position. The cam housing may then be displaced as shown in the illustration.

The distributor cover is retained by a spider held in position by three screws. Upon removing these the distributing brush and its holder will be exposed. Clean these parts with a soft brush, taking care to remove all foreign elements, and if very dirty the brush may be dipped in a little gasoline. Do not use oil of any kind. Exam-

ine the brush and note if it makes contact with the various segments. It is possible that the spring needs stretching slightly. If the brush makes proper contact it may be assumed that the breaker mechanism is at fault.

This differs from conventional practise in that small fibre rollers are placed at the sides of the contact breaker housing, which merely oscillates, the entire breaker mechanism revolving on the end of the armature shaft. The fibre cam rollers may stick, causing them to wear flat on the surface with which the contact lever comes in contact. These rollers should rotate freely on their bearing points, but not have too much lost motion or play. Have some one turn the motor while the make and break of these members is noted. It will be well to clean the mechanism, but do not lubricate any of the parts, as oil will affect the fibre, causing it to swell and create trouble.

Examine the contact points and if these be pitted or dirty, clean with a very fine file, taking care not to remove too much of the platinum and also to have the point contact squarely. In re-adjusting the points it will be noted that a lock nut holds the adjusting screw, and by loosening this and moving the platinum screw in or out, the proper break may be obtained. It should be approximately .015625 inch. The Bosch Magneto Company, 225 West 46th street, New York City, maker, or any of the branches, have a special wrench for this work. In the examination

Fig. 3—Distributor and Contact Breaker Mechanism of Bosch Magneto and Components Requiring Attention.

of the magneto it is suggested that the ground wire leading from the breaker box to the switch, etc., be examined carefully and, if worn or chafed,

a new one fitted. Sometimes a faulty wire is responsible for erratic action of a magneto.

#### Bushing Valve Guides.

(1656)—I have a motor with the valve guides cast integral with the cylinder. They are badly worn and I do not care to go to the expense of taking off the cylinders, having the guides rebored and new valves and stems made. Can your mechanical man suggest a method of doing the work without removing the cylinders? Am fairly handy working on a motor as I have done my own repairs for several years.  
Kingston, N. Y., Oct. 1. J. C. S.

A method of repairing the guides is shown at Fig. 4, it consisting of rebushing these members with steel tubing, which may be procured in varying outside and inside diameters. Assuming that the inside diameter of the bushing when fin-

Fig. 4—Suggestion for Rebushing Worn Valve Guides with Standard Steel Tubing.

ished should be .375 inch, the diameter of the valve stem, the walls of the bushing should be approximately .0625 inch thick, making the total outside diameter of the tubing .5 inch.

As the opening of the tubing is not always concentric with the outside diameter, before drilling or reaming out the bushings in the cylinders it is advisable to true up the bushings proper. This may be accomplished by placing on an arbor of a lathe and skimming off a trifle from the outside of the tube.

A jig will have to be constructed so that an accurate hole may be assured when drilling or reaming. It may be made by fitting a bushing to the opening of the spark plug cap as shown

and the bushing should be threaded to fit the opening as depicted, also have an inside diameter equal to that of the hole to be drilled. This will insure that the holes drilled will be accurate.

The bushing or tube should be a drive fit, so that its wall will be compressed slightly, making for a close fit of the valve stems by proper reaming or drilling. For drilling the tubes another bushing, a plain member, will be needed and it should fit inside the threaded member as illustrated. Before employing the spark plug cap make sure that its hole is concentrically accurate, and if not a special cap will have to be made if a good job is to be secured.

After fitting the valve stems to the bushings, the latter will have to be secured in place. This may be accomplished by drilling a .125 or .1875-inch hole through the guide and into the bushing. The point of the drill should just enter the wall of the tubing and the recess be made just deep enough to permit the screw to grip easily. The thread must be such that it will grip the screw firmly, and the latter should have a slight taper point and conform to the drill. In setting up the screw care must be exercised, else it will crush the walls of the bushing.

#### Sliding Gear for Ford.

(1657)—As a subscriber of The Automobile Journal I would like to have you inform me if there is any form of selective sliding gear transmission that could be placed on a model S Ford runabout.  
Fulton, N. Y., Sept. 29. E. D. P.

A selective sliding gearset could be fitted to the chassis of the car mentioned, but the cost of the transmission and installation would not warrant the expense involved. The writer remembers of such an installation made to the same type of machine, the owner of which stated that the cost exceeded his expectations. In addition it would be necessary to have good brakes, also to fit some form of clutch. The cheapest and best method would be to replace any worn parts of the present planetary transmission.

The Automobile Club of Springfield, Mass., has decided to employ a business secretary and to maintain permanently open headquarters. Charles A. L. Wright has been appointed the club's representative to the good roads congress in Detroit.

The proposed amendment to the state constitution to allow a \$50,000,000 bond issue for good roads, which will be submitted to the people of Pennsylvania at the November election, was discussed at a convention of those interested in its passage held in Harrisburg last month.

## FEATURES OF 1914 STEARNS-KNIGHT.

FOR the season of 1914 the F. B. Stearns Company, Cleveland, O., maker of the Stearns-Knight, will produce two chassis, one having a four-cylinder and the other a six-cylinder motor. Both are equipped with Knight engines of the same bore, 4.25 inches. The four has a 5.5-inch stroke and the six 5.75. Four, five, six and seven-passenger bodies, favoring European design, are offered on either chassis, and a three-passenger roadster, coupe and sedan are new announcements. The limousine and landaulet are continued.

The control has been centralized by placing the lighting switch, carburetor air adjustment, ignition switch and horn control on the steering post under the wheel, a system of small rods operating in the casing surrounding the post proper, being actuated by levers conveniently located. The lighting switch, however, is of the conventional design. A change from a bulb horn to an electric is noted.

The gearset of the four has been removed from the rear axle and is now amidships. Pressure feed of the fuel with tank at the rear, Stromberg carburetor and Mea magneto are continued as standard equipment. The varying level oil troughs are retained, there being one for each connecting rod, and with an increase of throttle

opening the troughs are raised and the supply of lubricant augmented. The oil is circulated by a gear pump. There is the usual sight feed.

The clutch is of the multiple disc type and a three-speed gearset is employed, having ball bearings. Drive is by shaft to a full floating rear axle, the motor to axle ratio being 3.90:1. The Gray & Davis lighting and motor starting system is fitted, the motor starter operating through a reduction gearing to a sliding pinion engaging

with teeth on the periphery of the flywheel. Connection is made by a pedal operated switch. The generator is driven by silent chain from the magneto shaft.

The six-cylinder is fundamentally the same, with the exception of a four-speed gearset. Wire wheel equipment is optional. The tire sizes on the four are 36 by 4.5 inches, and 37 by five on the larger model. The running boards are particularly clean, the tool boxes being placed just over them under the front seat. In the seven-passenger models the folding type of seats is fitted, making for convenience. Large pockets are provided at the rear of the front seats of the touring models. Sloping hoods add to the attractiveness of the design. The Gray & Davis lighting and motor starting system, two separate units, is standard equipment.

### DETAILS OF 1914 STEARNS-KNIGHT.

**Four, Five, Six and Seven-Passenger Touring Bodies, Three-Passenger Roadster, Coupe, Sedan, Limousine and Landaulet.**  
**Left Hand Drive, Centre Control.**  
**Electric Lighting and Starting.**  
**Four and Six-Cylinder Chassis.**  
**Sloping Hoods on All Models.**  
**Control Board Under Wheel.**  
**Gearset on Four Amidships.**  
**Folding Type Extra Seats.**  
**Wire Wheels Optional.**

## PROPER TREATMENT OF TIRE EQUIPMENT.

**T**HE following suggestions as to the proper treatment of tires and its effect in securing returns on the investment, are made by F. A. Henderson, manager of the adjusting department of the Goodyear Tire & Rubber Company, Akron, O.:

An automobile is pretty nearly human in one respect. It requires care to make life long, and care that it may perform its functions up to the standard of its creation. That is often entirely overlooked by the owner of the car and this negligence is certain to hasten the tire breakdown.

Any tire is subject to more or less abuse, owing to the fact that it must encounter all kinds of roads and receive little or no consideration from the driver. Cuts, stone bruises, mud blisters, etc., result, and if these are neglected they eventually spell out the destruction of the tire, as dissipation does the man.

Tire neglect runs bills up unbelievably. There are many more things for the drivers to consider than the mere driving of the car. Road conditions play an important part in the life of tires. Inflation, distribution of the weight of the machine and alignment of the wheels are also influential. No two tires in a set may give the same service, although their quality, workmanship and construction may be identical. One may give out far before its time. There is a reason for this. Do not blame the tire; always look at the real cause and place the blame where it belongs. The service and mileage of a tire depend as much on the conditions under which it is used as upon the quality of the tire itself.

Possibly three-fourths of the tires returned to the manufacturers for repairs have been ridden insufficiently inflated. Insufficient inflation is responsible to a greater extent than perhaps anything else for blow-outs and quick disintegration.

When a tire is imperfectly inflated the walls are continually bending back and forth as the car moves, with the same result as when a wire or piece of metal is bent back and forth in the hands. Heat is engendered in the threads and because of this heat, and the continued bending, the walls soon weaken and give away. In a short time they are not strong enough to support the air pressure multiplied by the weight of the car and blow-outs result. Not only that, but when a tire becomes loose, a lump or fold of rubber and fabric is formed just in front of the part in contact with the ground. This is what tire makers call "kinking." This tends to separate the plies of the fabric, or in aggravated cases, to chew up the walls of the tire, as well as that portion of the tube that happens to get caught.

Don't inflate your tires by guess. A big, thick walled tire will show little depression under a heavy load, even though the air pressure is too low for safety. One cannot tell from appearance whether or not the tires are perfectly inflated. A good gauge should be used and tires tested every day.

### Little Cut Like Bad Habit.

A little cut in a tire, like a little habit, if allowed to grow, soon gets beyond control and eventually destroys the tire. A close watch should be kept of these little cuts. They should be cleansed from sand and dirt with gasoline and then filled with cement and quick repair gum. This gum will set in a few hours, become an integral part of the tire and prevent future trouble. A very large cut after thus being treated should be vulcanized at the earliest possible moment. To ignore these casing cuts altogether is to invite sand blisters and mud-boils, which are caused by sand and dust entering the cut and working in between the tread and the fabric of the casing.

These are diseases to which tires of any type or make are subject if they are not checked soon when the symptoms appear—small cuts in the tread. Sand blisters and mud-boils are more complicated and disastrous the longer they are allowed to go. They mean simply the stripping apart of the rubber from the fabric used to reinforce it. Sand and dust enter and gradually work their way between the rubber and fabric, and the result is a sand blister or mud-bol.

Tires that have already developed all these diseases—mud-boils or sand blisters—should be sent to the repair man at once. When these blisters are cleansed out and vulcanized down, your tire is practically as good as new.

### Some Causes of Failure.

If an axle is even slightly out of true, the tire will be subjected to a grinding action, which will wear out the tread in an incredibly short length of time. If you go over a heavy bump or have an accident of any kind, have your wheels examined at once. Don't wait until the tread of your tire is worn off and then blame the tire maker.

When imbedded in rubber and not subjected to strains or weakened by bending, the fabric used to reinforce the tire will retain its strength indefinitely. As soon, however, as the rubber is removed and moisture from the road is permitted to penetrate, the fabric begins to disintegrate and in a short time its strength and resistance are gone forever.

If one tire stops the load, as is often the case when brakes are not properly adjusted, the tread is liable to be worn through to the fabric by one application of the brake. The strain of stopping the car is thrown almost entirely on one wheel. It is set and the tire is subjected to a severe grinding action with the pavement or road. See that the brakes are adjusted to equally distribute the strain. Sudden stops have the same effect and should be avoided. Skidding around corners at high speed is likewise very disastrous.

The fabric having been thus weakened it is a matter of a short time until the air pressure in the tube, increased by the weight and strain of a heavy car, becomes too great for the container or casing, and a loud report announces to the driver that the tire has suffered a blow-out. Naturally, the driver seeks the cause. If one is not patently apparent, the manufacturer is blamed for defective material or workmanship. To experts, however, the causes are well known. So long as the fabric is preserved as it was when the tire was new, the blow-out is not likely to occur. Let the tire be ridden partly or wholly deflated for a distance, or suffer a cut or stone bruise, the fabric is weakened as a result and once trouble starts it gradually becomes worse until the blow-out point is reached. Too frequently the driver finding no immediate cause, disregards entirely the remote abuses, which are the real causes of his troubles. In the case of a cut or bruise, the blow-out may not occur for days after the accident, enough of the fabric being left intact to sustain the pressure for some time.

Tire fabric is like other textiles. It tears easily once it is cut, while it resists the most severe strains when uninjured. A very small cut or rend in the fabric, may, therefore, result in a bad blow-out if not properly repaired.

### Effects of Overloading.

Pneumatic automobile tires are designed to carry loads in proportion to their cross sections and diameters. Nothing will tear tires to pieces so quickly as overloading. Many motorists who get frequent punctures and blow-outs, and who have tire troubles in general, can trace their difficulties to overloading. Tops, windshields and many other devices are considered as extras by the manufacturer and may increase the catalogue weight materially.

It is estimated that five per cent. added to the weight of the car adds 15 per cent. to the wear and tear on the tires. For this reason it is always economy to adopt tires one or two sizes larger than the regular equipment on your car. Even if the regular size tires are not overloaded, additional mileage and satisfaction to cover the additional cost will be given by larger tires.

The tremendous horsepower of some high priced machines produces an effect similar to overloading. The strain is too great for rubber and fabric to endure long uninjured.

### Use of Chains.

If chains are used they should have proper adjustment. Chains applied too tightly will cut the tread out and render the tire useless in a short time. The chains should be adjusted to allow them to shift around over the tread and the wear will be distributed.

If one-piece clincher rims are used, it is advisable to examine them at frequent intervals for dents. The clinch-

er rim is easily bent and being subject to rust the edges may become worn down to a cutting edge, then rim-cutting begins and the case is soon cut through.

When a clincher tire rim-cuts, examine the rim to see if the cause is not to be found there. Casings should be removed from the rims occasionally to allow an examination of both rims and casings, the casings for breaks and indications of breaks in the fabric, for strains show up sometimes inside first, and can be reinforced with a patch, and an ultimate blow-out may be avoided; the rims, for dents, irregularities and rust.

With clincher tires one of the costly evils is irregularity of rims. If the rim does not fit the clinch of the tire with perfect contact, the bead is soon destroyed and water is allowed to enter the tire with destroying influence.

If, when the casing is removed, the shoulder of the bead appears yellow or rusty, the rim should be thoroughly scoured with emery cloth and given a coat of aluminum paint. A rusty rim soon eats away the canvas. The tire should, of course, be thoroughly cleansed before it is again applied.

#### How Tires Should Be Stored.

Tires should not be stored or left off any length of time unused in the direct rays of the sun, or kept in very warm quarters. Under such conditions the rubber quickly loses its elasticity, becomes hard and soon develops innumerable fine cracks. A continued exposure as above will render the best tire practically valueless in a few months.

When buying a new case or a tube, it will be wise to see that the dealer has not had it displayed in the window. To secure the longest life and greatest amount of service from a tire it should be stored in dry, cool and dark quarters.

Never allow tires to stand in oil at the garage or elsewhere, and be particular to wipe off any oil which may drop on the tires at any time. Lubricating oil greatly softens the rubber, makes it pasty and glue-like in consistency and takes all the resistance and elasticity out of it. This oil may be cleaned from the tires with gasoline, as gasoline evaporates and does not result in injury.

If, when the car is idle, it is jacked up, it will add to the life of the tires, as they are then bearing only the pressure of the air with which they are inflated, whereas, when supporting the weight of the car, this weight, often several thousand pounds, is exerting a continual, unnecessary strain on the casing walls. By adopting this course it is estimated that the life of the tires will be increased by at least half the time that the car stands idle.

The motoring public is fast coming into realization of the truth of the suggestions given above and its tire troubles are growing less.

The Goodyear Tire & Rubber Company has inaugurated an educational campaign. We realize the public is not as familiar with the care of tires as it should be, and our representatives have instructions to give tire users all the time necessary in order to educate them as to their proper care of their tires. We feel sure this campaign will be of benefit to the automobile world in general.

The chamber of commerce in San Antonio, Tex., has taken steps to raise a \$5000 guarantee, pledged by the business men of the city, for an automobile race meet during the first week in November.

The first official display of 1914 models is being made by the dealers in St. Louis, Mo., in a show which opened in Forest Park Highlands, Oct. 6, and which will continue until Oct. 11.

## THE COLE TEST TRIP.

### Long Distance Transcontinental Tour Now Rapidly Drawing to a Close.

One of the most interesting test trips ever undertaken by a motor car manufacturer is now drawing to a close. Chief Engineer Crawford of the Cole Motor Car Company left Spokane, Wash., last week on the last leg of the journey to the factory in Indianapolis. The car is a six-cylinder 1914 Cole model. Upon its return to Indianapolis it will be subjected to another rigid inspection, similar to that which it underwent in San Francisco and which is illustrated herewith.

Mr. Crawford left Indianapolis in July, shortly after the departure of the tourists of the Indiana Automobile Manufacturers' Association, and arrived in San Francisco a few hours later than the others. Subsequently, the car was com-

Cole Engineering Test Car Dismantled in San Francisco at Completion of Transcontinental Run from Indianapolis.

pletely dismantled as shown. Then it was sent up the Pacific Coast to Portland and Spokane, encountering some of the worst grades in the country.

The itinerary from Spokane to Indianapolis includes a section of the country through which but few automobiles have been driven. There is much interest in the Far West—and this interest will, no doubt, extend to every section of the country—in learning just what the dismantling test at the factory will disclose.

The Attleboro Automobile Club has been organized in Attleboro, Mass., with the following officers: President, Frank Mossberg; vice president, Dr. R. P. Kent; secretary-treasurer, J. H. Vallette; directors, the above and W. J. Luther and Walter Kendall. The club has a charter membership of about 25.

## GARAGE AND REPAIR SHOP EQUIPMENT.

**L**ABOR saving devices spell economy. Any equipment that completes the work in quicker time and as satisfactorily as with the

Valve Seat Reseating Tool

older methods, is bound to attract and retain custom. These points are brought out in the announcement of the G. B. Sales Corporation, 1790 Broadway, New York City, which concern is marketing the G. B. valve tool. The company maintains that it requires about eight hours to place a badly scored set of valves in good condition again by usual methods, representing an expense of \$4.80 to the owner, and that the G. B. outfit will accomplish the same results in 30 minutes.

The equipment, which is shown in accompanying illustrations, is for reseating as well as redressing the valves, and the maker states that it will reface valves to a perfect angle of 45 degrees and may be utilized with those of any size and material. The tool is so constructed that the valve must always be on centre when it is being dressed, insuring a uniform face. The device is also serviceable when ridges, grooves, pits, etc., are to be removed and which take considerable time when ground by hand.

The G. B. tool is the invention of George C. Bouthinon, who has had considerable experience in the manufacture of motor cars, and he designed it to save time in the factory. It is of drop forged, case hardened steel, the blade and seat cutter being of high speed, oil tempered tool steel, and guaranteed against defects in material and workmanship.

To use, the tool is clamped in the vise, a bridge member opened, and the blade disengaged by loosening a lock screw. The valve is then placed in the cone section and the knurling nuts turned to equalize the distance on both end threads so that a roller bearing will be flat on the valve stem. The knurling lock nut is secured and

the bridge closed, the latter being retained by a pin member. The blade is then adjusted and locked. The valve is rotated by a dog and feed is by thumb screw. The blades and cutters are sharpened easily.

### ERICKSON HOSE CLAMP.

P. E. Erickson & Son, Port Chester, N. Y., is manufacturing a new type of hose clamp. One end of the band intersects the other and this with a screw adjustment permits of use with different diameter hose. The standard finish is electro-galvanized, but other finishes are provided. The sizes range from .375 to two inches.

### ATLAS BALL GAUGE.

The Atlas Ball Company, Philadelphia, is placing on the market a new ball gauge which can be utilized as a limit gauge, the ball on one end being gauged to 1.251 inches, and the other 1.249 inches. Complete details are supplied by the company, which is located at 201 Glenwood avenue.

### SPRINGFIELD CIRCLE CUTTER.

The Shawver Company, Springfield, O., is manufacturing the Springfield circle cutter, which

G. B. Valve Tool

is a very useful tool in the garage and repair shop, as by it gaskets may be cut to any size circles up to 14 inches. The device is provided

with a positive measuring scale, making it a simple matter to adjust the knife. The last named member will cut rubber, felt, fibre, etc.,

Springfield Circle Cutter.

and provision is made for cutting glass and sheet copper. The equipment includes a knife for square edge and bevel edge

work. The cutter weighs but 12 pounds, is constructed of high grade material, and is moderately priced. Particulars will be mailed on request.

### GLOBE AIR COMPRESSORS.

The Globe Manufacturing Company, Battle Creek, Mich., is marketing a line of air compressors with various equipments to meet the requirements of service, including portable and stationary outfits. All are of the air-cooled type and it is stated that stuffing boxes, oil cups, piston packings, etc., are eliminated, and that all working parts are fully enclosed. One of the compressors is shown in an accompanying illustration and when in operation will develop and maintain 150 pounds or more of pressure. The company also produces an automatic outfit, which keeps the tank constantly stored at a predetermined pressure. The company issues a catalogue in which are listed 20 types of compressors and each equipment is fully explained.

### MILLER STEAM VULCANIZER.

Charles E. Miller, Anderson, Ind., is marketing the Five-In-One steam vulcanizer, which has a circular surface and essential clamps for repairing eight tubes at the same time. The circular tube plate has four extensions for casings. The gas or gasoline burner is stationary, but the vulcanizer proper may be rotated as desired. Air bags are eliminated, as the outfit is operated with pad and clamp pressure.

### LINDHE SHIMS.

The Lindhe Shim Company, 212 Canal street, New York City, is marketing the Lindhe shims in two new sets. The first is known as the No. 1 and comprises one strip, .03125 by two by nine inches (all .002 inch laminations); .0625 by two

by nine inches; .125 by two by nine inches; the last two named are half .002 inch laminations and half solid brass. The second set consists of similar sizes, excepting the laminations are .003 inch. By combining these different pieces almost any thickness of shim can be obtained.

### GLYCO REINFORCED BEARING.

The Glyco bearing is being marketed by Joseph T. Ryerson & Son, Chicago, and it is claimed that by a bronze or steel reinforcement of skeleton construction the body and flange are greatly strengthened.

The Automobile Club of Vermont held its 12th annual meeting at Montpelier, Vt., recently, and elected the following officers: President, Lester H. Greene, Montpelier; vice president, E. A. Brodie, Burlington; secretary-treasurer, Smith S. Ballard, Montpelier; director, George H. Morrill, St. Johnsbury; representative in American Automobile Association, Edwin C. Smith, St. Albans. The meeting was addressed by Guy W. Bailey, secretary of state, his subject being "Automobile Laws and Good Roads."

The September number of The Haynes Pioneer, a monthly publication, devoted to the interests of the Haynes Automobile Company, Kokomo, Ind., is unusually interesting, containing as it does a description of the ignition system

Globe Air-Cooled Air Compressor Designed for Garage Service, Etc.

utilized on the new models. The magneto is described and illustrated, and its operation is explained.

## THE REPAIR SHOP AND THE GARAGE.

### Suggestions for a Testing Seat Having Adjustable Features and Adaptable to Various Chassis--Safety Socket for Tiebars and Drag Links.

A THOROUGH overhaul of the car is followed by testing the chassis out on the road, where the carburetor is tuned up, minor

**Duryea Safety Socket for Tiebars and Drag Links.**

adjustments, etc., being made. It is customary to attach some form of temporary seat to the chassis undergoing road test, and owing to different makes of cars it is not always easy to secure the seat. In an accompanying illustration is shown a testing seat which can be constructed at slight expense, and with very little trouble it may be adjusted to fit any chassis, and shifted to accommodate either right or left hand steer.

The top member of the seat is constructed of a suitable length and thickness of plank which is cut in two, the cut being made three or four inches from the centre as shown in the sketch. The side members or standards are of .875 or inch board and the top boards are screwed onto these. To prevent sidesway, angle irons are fitted, two to each standard.

The seat is made adjustable by boring two holes in the smaller board and cutting two slots in the larger member as shown. Two mild steel plates .25 inch thick and nine long, with width equal to that of the plank, are employed to secure the two halves, bolts passing through the plate and slots in the seat. Four bars of .5 or .625-inch round iron and about eight inches longer than the seat over all, are threaded and fitted with nuts and washers. Four holes are bored in the side standards at a suitable pitch to allow the rods, when in position, to clear the chassis frame.

To fit the seat to a chassis, it is placed in position, the rods fitted over and under the frame as shown, and the nuts screwed up snugly. As the bolts in the plates will slide in the slot during the fitting, these members should be loose while

the seat is being placed on the chassis, but they are tightened in position after the rods are secured. By taking a chair and removing the legs, a comfortable seat may be obtained. By using four round headed bolts and drilling a like number of holes on the right and left hand ends of the large plank or seat, the chair may be used for either right or left hand drive. To prevent the standards marring the paint of the frame, leather strips can be fitted, and if the rods are screwed up tight there will be no slip to chafe the varnish.

#### DURYEA SAFETY SOCKET.

The Duryea Motor Company, Saginaw, Mich., has brought out a safety socket for tiebars and drag links and the device is not only simple in design but light. The socket is shown in an accompanying illustration and it will be noted that the main tiebar is of steel tubing, having near each end a large and small hole transversely through it. Around this tube telescopes the socket proper, also of steel tubing, but spun at one end to the form of the ball of the steering arm, this spinning leaving a small hole for oiling. Through one side of this socket is bored a hole to admit the ball, while the usual cup and anti-rattle spring are applied near the end of the main tiebar tube.

The parts are assembled by a special clamp

**An Inexpensive Testing Seat Adjustable to Any Chassis and Quickly Attached.**

which compresses the spring when the parts are in place and permits of inserting the single bolt, which binds the parts together, a pin having been

placed across the main tube to act as an abutment for the spring. The maker points out that the construction is moderately priced, that it is so designed that the end of the main tube comes almost against the ball, and that the breaking of the spring does not permit the socket to get off the ball of the steering arm.

### LOCK NUT SUGGESTION.

A driver makes the following suggestion for eliminating cotter pins and preventing nuts from working loose on the spring clips, brake drums, etc.: Make a saw cut in the bolt, screw up the nut, then spread the bolt with a chisel.

### CASE HARDENING HINT.

In case hardening, where the work must be uniformly hard all over, the usual treatment is satisfactory, but when only the wearing surfaces are to be hardened and other parts left soft for machining, etc., a different process will be required. Ordinary fire clay is sometimes used, but it tends to crack or peel during the heating, exposing some of the surface, which is not desired.

It is suggested by an experienced mechanic that a solution of copper be used on the parts desired to be left soft, in that less than one-hundredths of an inch in thickness of the copper will resist the action of any hardening compound. If plating vats are not convenient, a strong solution of sulphate of copper may be utilized.

### ECONOMY WITH KISSELKARS.

#### Chicago Owners Testify to Low Cost of Upkeep for Two Years' Service.

W. S. Trescott, manager of the Moneyweight Scale Company, Chicago, believes he is justified in boasting of the service rendered by his 40 horsepower KisselKar, made by the Kissel Motor Car Company, Hartford, Wis. He has driven this machine an average of 2000 miles a month since April 1, 1912, and has experienced no mechanical trouble. He reports that he gets 15 to 18 miles to a gallon of fuel.

Another Chicago owner, who is not adverse to expressing his opinion in public is F. J. Heidler of the Fink-Heidler Lumber Company, who has a 1911 KisselKar 6-60. He declares that his total repair bill for the second year of service was \$2.50. "It is the most economical car I ever saw," is the manner in which he expresses his convictions.

### ANOTHER NATIONAL RECORD.

#### New England Owner Claims to Have Reduced New York to Boston Mark.

The National Motor Vehicle Company, Indianapolis, Ind., is resting upon its laurels, insofar as racing is concerned, having secured the national, international and world's stock car championships, which have not as yet been wrested from it, although the marks were set almost two years ago. For this reason National cars have not been seen in racing events this year, except in such isolated instances as individual owners have seen fit to make entry.

It would appear, therefore, that National cars had little more to secure in the way of records, but Richard G. Badger and his brother, Hard G. Badger of Boston, recently notified the factory that they had reduced the cross country record between New York City and Boston to 6:15:00, elapsed time, the actual running time being 5:45:00. The trip was made with entire absence of tire trouble and without any inconveniences.

### TO DISTRIBUTE COLE CARS.

#### Prominent Boston Men Form Company to Handle Sales in That District.

It became known recently that H. J. Habich of the G. E. & H. J. Habich Company, Boston, Mass., distributor for Cole cars, made by the Cole Motor Car Company, Indianapolis, Ind., was to retire from the concern. It now appears that the Cole Motor Car Company of Boston is to be formed to take over the sale of this product in eastern Massachusetts.

The new concern is financed by two retired capitalists of Boston, William Hickox and Grant C. Smith, and at least a portion of the old Habich company will be retained in the organization. G. E. Habich is to be in charge of the sales department, and Conrad Smith, son of Grant C. Smith, who was in the old company's sales department, will continue in that position. Edward Linehan will retain the direction of the service department.

In the future the Cole will be displayed in a handsomely appointed showroom at 94 Massachusetts avenue, and the big service station of the company will be maintained at 53 Bickerstaff street.

T. H. McGiehan, for the past year general manager of the Motz Tire & Rubber Company, Akron, O., has been elected vice president.

# CHARACTERISTICS OF HEAVY FUELS.

## Part IV--Effects of Varying Temperature of Compression upon the Fuel, and Causes of Internal Condensation--Factors Making for Smoky Exhaust.

**I**N THE last issue the operation of an automobile engine supplied with heavy fuel and controlled by a throttle was discussed, and some of the results obtained were outlined. The conclusions drawn by R. Owen Allsop as to the causes of trouble are given herein, and the article is supplemented by remarks by another prominent authority on heavy fuels and carburetion. Both are important in that they advance reasons for the lack of successful heavy fuel carburetors and explain some of the difficulties attendant upon the use of kerosene as a fuel in the automobile engine.

### Internal Condensation.

The lowered compression curve is thermodynamic loss and in the variable speed oil engine it has been shown that it is accompanied by imperfect performance of the engine cycle. In considering the effect of internal condensation, it has been pointed out that it indicated that

Fig. 20—Illustrating Hypothetical Action Concerning Heat of Compression and Condensation in the Engine Charge.

varied load resulting in varied speed sets up conditions affecting feed and concerning vaporization as reacting on the condition of such feed, and at times, it was shown, that variable temperature of the vaporizer surfaces must be taken into account, and that it is the chief reactive effect attendant upon varied load as such.

The slow speed overloaded, and the slow speed free engine—both must suffer from internal condensation phenomena, for plainly, if the charge condition is suitable for high compression, that is, suitable under this condition, to provide petroleum fuel in a fit state for combustion, should the temperature of compression be varied, as the result of varied throttle valve position, that which is not converted into vapor by adiabatic compression, remains or persists as a liquid. In other words, if the heat of compression falls, the amount of combustible in fit state for combustion is reduced, and the engine having a wet vapor feed commences to knock, indicating pre-ignition, itself sufficient to show that howsoever good the mixture of air and combustible, liquid fuel pertains in the charge at the culmination of compression. The question naturally arises, if the liquid fuel, as such, present at the end of the charging stroke, is not vaporized by

adiabatic compression, what becomes of, and what happens to it?

### Effects of Compression Stroke.

It is often assumed that air compression with the accumulated heat of such compression, always acts to vaporize petroleum, and this may be assumed to be so under certain conditions. The compression stroke of the four-stroke cycle for oil engines must be esteemed of high value, but powerful for good if under control. It may also prove to be a bad master, causing coalescence of oil globules and casting these on the cylinder walls, spreading practically a layer of fuel upon the lubrication film. In the case of the hypothetical engines, the overload caused disorganization, it being held to be due to the coarsening of the feed and the lowering of the temperature of compression. The same condition was noted when the clutch was engaged and the piston speed of the engine fell. It was also decided that the act of varying compression, originating in engines from throttling, caused varied temperatures of compression. As a main result from this it was held that the amount of combustible would vary as the temperature of compression.

### Factor of Condensation.

It therefore becomes necessary to inquire if an approximately constant amount of feed an engine induction stroke is fed into a cylinder, and of this so much is combustible, what becomes of the residue or balance, which is not in a fit state of combustion? It certainly goes into the cylinder and must come out at some time or other, or there would be a rapid accumulation, either of oil or oil decomposition. And it may be stated that stationary oil engines have been made and commercially exploited wherein the lubricant of the piston was designedly by condensed petroleum. Condensation of the fuel fed into oil engines is a long recognized phenomenon, but the subject has generally been considered only as affecting running and thermal efficiency. If engines can be lubricated with condensation from the fuel, such condensation must be more or less existent in all oil engines when the vapor is sufficiently wet to render the action possible.

From the moment when the overload commences to bring down engine speed, petroleum as liquid begins to fall upon the cylinder walls so that, when the clutch is disengaged, there acts not only the factor of spray degeneration and the weakening of the charge, but also a throwing out of condensed fuel which, being re-evaporated during the combustion and exhaust strokes, must lead to increased visible exhaust, and which, but for the insulating and cleansing effect of the lubricating film, would under the method of evaporation unquestionably foul the cylinders and bring about sticky piston troubles. Variable load engines, coupled with varying piston speed, set up difficulties relating to feed, directly by spraying variations, and indirectly by matters concerning compression and internal condensation. Viewing the nature of petroleum as compared with gasoline, the one condensable, the other volatile, the trouble that accrues may be comprehended if feed is characterized by liquid spray where pure vapor intimately mixed with air should be the condition.

### Heat of Compression.

In a high state of carburetion, the result of fine pulverization projected without delay straight onto highly heated vaporizing surfaces, coupled with adequate means of introducing extra air, such air not being merely introduced, but caused to disseminate among the finely divided fuel, the compression stroke acts, no doubt, to complete that feed preparation that commenced externally to the engine. Varying piston speed here tells less heavily against good combustion results. A fine point may be involved respecting whether vaporization or condensation may result from compression, but it seems possible that even when all work of air compression is converted into heat, large oil globules may not vaporize, but may be caused to coalesce one with another. If this be true, then it would tend to show that effective and con-

stant atomization has benefits that are two-fold; on the one hand there results a superior state of engine charge; on the other, internal cylinder condensation troubles are alleviated. Again, where the condition of running includes variable spray formation—now fine, now coarse—the evils are also two-fold, for not only is the charge impoverished, but it also suffers from effects of varying compression absent, or not nearly so pronounced, under a refined condition of carburetion.

The diagram at Fig. 20 may usefully illustrate hypothetical action concerning heat of compression, and condensation in the engine charge. The parts of vapor are represented by L and M as a particle of hydrocarbon fuel existing as liquid. In the diagram A there are six parts of vapor, and a condensation containing a further six parts of vapor. If it be assumed that diagram A represents the conditions in the cylinder at the end of the charging stroke, a hot compression may result in the condition indicated at B. Heat of compression has vaporized the condensation, there being now 12 parts of vapor. Generally, the idea here put diagrammatically shows the value of compression heat in oil engines, for, but for this internal heat, many engines would be useless. Assuming that such action takes place rhythmically, all goes well—that is to say, at constant load and speed, with constant feed and mixture; every compression stroke gives a constant amount of the fuel combustible, while wall action, if a deformation in the cycle, is at least consistent.

#### Causes of Smoky Exhaust.

Now, if high temperature of compression changes state A to state B—as when the engine runs fast with open throttle—if the throttle be closed and the speed fall, it may be assumed that the state A may persist more or less during and up to the completion of the compression stroke. Therefore, it is assumed that the compression changes from hot to cold and cold to hot; at one time perfect combustion will be obtained, at another smoky exhaust, and this in spite of constant feed. In changing from A to B, the combustible in a state fitted for combustion is doubled in amount, the completely vaporized charge B having 12 parts vapor. If the particle M is of sufficient size and gravity to resist compression heat and the blast of combustion, it will be cast out in the exhaust in a dense vaporous condition which renders the action and results visible to the eye. The diagrams C, D and E enlarge the hypothetical action, for N is assumed to be a denser condensation than M—a heavier particle of fuel spray. A condition may now be conceived of an engine running in which, although the feed may be absolutely constant as to quality, amount and proportion, and assumed to exist at the end of the compression stroke made under certain conditions of pressure and temperature as state D, the charge on ignition will vary at times, and be on different occasions as indicated at C, D and E. In C, D or E are shown 24 parts of combustible vapor. Such conditions may conceivably bear some relation to the three compression curves A, B and C in Fig. 19.

If there is enough combustible vapor present to give an effective explosion in an oil engine, it might be possible to augment the feed in the form of heavy spray without bringing the machine to a standstill, often without greatly upsetting the action, but necessarily with great volumes of smoky exhaust and heavy condensation on the cylinder walls. This cannot be done with gasoline because of its volatile nature, as the mixture is enriched until it becomes practically non-ignitable.

#### Fineness of Spray a Factor.

It is generally supposed that the heat of compression converts oil spray into vapor, but where such statements are made there should be added: If the spray is sufficiently fine and if there be sufficient air in the charge. If it be assumed that diagram E represents, not mixture, but vapor solely, compression will bring about states D and C; that is, it will condense vapor to liquid so that, as previously suggested, not only is the result of compression on the oil engine charge dependent on pressure and temperature, but also on the amount of air present.

Oil spray may persist as an individual agglomeration of hydrocarbon through the whole ordeal of compression and combustion. High temperature in the cylinder with low pressure favors vaporization most, so that high speed in a throttled engine may be as effective as a high degree of compression heat with low speed. Fundamentally the premises are sound, but the whole action is somewhat obscure at the point of critical temperature and pressure, where a substance may exist either as a liquid or vapor.

A high state of carburetion is the only protection against the evils resultant from varying compression and varying piston speed, for by very thorough mixing of air in very thoroughly vaporized fuel, each particle of combustible has an aerial envelope apparently acting to prevent aggregation of the individual units composing the charge. It is noteworthy that the non-spraying, direct vaporizing system of fuel treatment is prone to encourage deposits in engines, and it may be assumed that the trouble arises from stratification—massing of fuel into vapor clouds which become more or less liquid during compression. The old practise of squirting gasoline into the inlet of the engine was highly productive of sooting, and must be deemed a parallel in its effects with the stratification to which allusion has been made.

To add air to petroleum directly vaporized from heated surfaces, in such manner that perfect carburetion may result, is difficult. The spraying method shown at Fig. 21, suggesting stratified vapor, difficult to aerate, and air, as indicated by arrows forcing its way into sprayed fuel, suggests at once an effective method of commencing the process of carburetion, for in direct vaporization the air must force its way among the particles naturally desiring to aggregate. It seems strange that the oil engine having a coarse feed does not foul, whereas the highly efficient vaporization of direct vaporizing methods tends this way. The presence of liquid fuel in excess seems, by maintaining a constantly flooded state, to prevent deposition of carbon, so that the engine action is satisfactory and the conditions in a sense cleanly, although the exhaust is always dense.

#### Control and Visible Exhaust.

The act of control of a motor car kerosene engine, whether from load or for speed, brings into play many

Fig. 21—Suggesting Stratified Vapor, Difficult to Aerate, and Air, as Indicated by Arrows Forcing Its Way into Sprayed Fuel.

peculiar actions attendant upon combustion within cold cylinder walls that create visible exhaust, which may or may not be coincident with internal trouble from fouling of the engine parts. It is by no means certain that the smoking oil engine is causing trouble internally. Often the reverse is indicated, for of all fouling processes none is more insidious than vaporization direct; that is, without the intervention of preliminary spraying, and it always needs be noted that fine spray includes high aeration. If the fuel be vaporized directly, vaporization as such may be effective, but into this mass of vapor air must be introduced and to cause perfect intermingling. It has, therefore, always appeared to the writer that preliminary spraying is fundamentally a preferable principle for oil engines that are intended for variable load and variable speed, and that this principle is good whether as to a detachable carburetor or as to an integral heavy oil engine.

Thus far the origin of smoke from the motor has been traced to several causes, all coincident so far as determining that the cause is liquid fuel in an engine charge that should be gaseous. The immediate factors bringing about the trouble have been investigated and prominent among these has been found degeneration in spray, or in other words, that the fuel is not at times under all conditions, properly broken up. Whether the liquid particles originate at the sprayer, or whether they are produced by causes acting inside the cylinder, the effect of their presence institutes visible exhaust. The various considerations entered into should remind the

engine designer how important the matter of water cooling is in imperfect oil motors.

#### Value of Hot Jacket.

As a very general rule the oil engine having a wet vapor feed runs best with a hot jacket. From what has been discussed respecting the sensitiveness to temperature of the oil engine charge, it can be seen that the total amount of fuel held up in the cylinder in a fit state for effective and smokeless combustion can be greatly modified by water jacket temperature. The essential difference between cylinder charges of spirit and heavy fuel engines is that the former is stable and the latter extremely sensitive to temperature conditions. The only way to bring about improvement in the latter is by insuring true vapor perfectly intermingled with air. Irregular mixing must be deemed a great evil, for whatsoever may be the effect of compression upon mixture, the compression of true vapor necessarily condenses that vapor, so that, while small vapor clouds, or stratification, occur, the vapor will be converted by compression into liquid fuel globules, or at the best a state of equilibrium may be occasioned—neither vaporization nor condensation. It is the air that usefully serves as a medium whereby compression can be accomplished, retaining heat represented by work done.

It is worthy of careful note that the trouble with oil motors is greatly aggravated by the prevalent fashion of throttle control. An engine running with fixed gas as fuel is well suited for the method of throttle control, the gasoline engine in a less measure; for every one of the points herein detailed applies, on a greatly reduced scale, to normal gasoline engines, of which the designers are only now beginning to realize that the earlier carburetors suffered from crude spraying and want of devices for controlling spraying. Atomizing jets are only today being recognized as necessary, if gasoline is to be economized and the smell of the overloaded gasoline engine mitigated. The throttle is a simple and convenient method of control with the gasoline engine, but in oil engines it originates evils only to be combated by producing a less sensitive charge.

The above might lead the casual reader to the conclusion that the combustion of kerosene is a practical impossibility insofar as the obtaining of satisfactory all around results is concerned, but it should be remembered that the article deals mainly with the use of kerosene by what might be termed the suction spray carburetor method. Robert W. A. Brewer, an English authority on carburetion and fuels, states such a method of utilizing kerosene for internal combustion engines which are subjected to large variations of load and speed, is not to be recommended. He says:

#### Kerosene a Practical Fuel.

From the distant past up to the present time a long train of inventors has endeavored, with almost universal failure, to feed an internal combustion engine of the high speed type by means of a suction operated instrument, and the difficulties in connection with such an apparatus have proved so disheartening that one after the other of these various kerosene carburetors have disappeared from the public view. Generally the first claim that is made for an instrument of this type is that it will start from cold, but the experience of the writer has been that wherever a kerosene carburetor has been submitted with this claim it has failed to justify the statements of its inventor.

On the face of it, we may say that in the ordinary way it is an impossibility with our present knowledge to start a kerosene carburetor without the addition of any sort of heat whatsoever, by reason of the fact that kerosene can only be made to burn otherwise under conditions of very fine spraying. If we could so design spray producers, which could be fitted into the combustion heads of the cylinders comprising an ordinary automobile motor, and if these spray producing apparatus could be

so finely adjusted that they injected only sufficient fuel for complete combustion, there is no doubt that a spray type of kerosene carburetion could be produced. However, one does not see any means by which such an ideal state could be put into practical application, and one must come to the conclusion that the suction operated spray type or the pressure fed spray type, without the assistance of some external heating device, can be ruled out of court.

#### Carbureting Kerosene.

Mr. Allsop points out that the question of variable speed is seldom mentioned. This is the principal factor causing difficulty in connection with the carburetion of kerosene, and this is a fact when one considers solely the suction operated type of instrument, but variable speed of engine does not necessarily mean that the gas speed varies, for we know that the modern development in carburetor practice has led to the more constant gas speed type of instrument which controls the speed of the gas through the carburetor, and by which we are more likely to obtain satisfactory carburetion under all engine demands. For instance: If an engine is running under light load it is necessary to concentrate the air flow around the fuel orifice and keep up the speed of the air so that satisfactory atomization can take place. On the other hand, if the demand increases to its utter limit of power the speed should not be allowed to rise abnormally and impair the output of the engine.

There is another point in connection with the article which refers principally to those types of instruments which are simply and solely throttle controlled, and it is shown that the amount of the charge has to be varied in order to govern the engine, and presumably the composition of the charge is kept more or less within constant limits. Although the explosive limits between which one can use kerosene are somewhat narrowed down as compared with the more volatile fuels, yet there is no doubt that it is possible to run a kerosene operated engine on mixtures of varying strength, and in passing the writer would like to draw attention to the fact that under light loads the compression can be maintained to a much higher point than one might anticipate, by weakening the strength of the charge. The writer has discovered in actual practice that there is some advantage to be gained by keeping the compression up; that is, by keeping the throttle open and running on a weak mixture, and it would appear that the desired high temperature of the cylinder walls can be more easily maintained through periods of light loading by carrying such a theory into actual practice.

#### Limit of Temperature.

Without going into definite figures of vaporizer temperature it would be well to bear in mind several points which are of practical value in this connection. There is, undoubtedly, a well defined limit of temperature which is most suitable for the purpose of vaporization, as when the temperature of the vaporizer is below this value, if sufficient vaporization occurs thereon, the heavier particles of fuel are left behind. On the other hand, if the vaporizer temperature is too high, kerosene as a liquid never comes in contact with the hot surfaces, but each globule is at once surrounded by a sheath of its own vapor, which prevents the liquid coming into actual contact, and effectually prevents vaporization of the liquid itself. A ready example of this state of affairs can be obtained if one endeavors to place water upon a heated surface the temperature of which is sufficiently high to cause a sheath of steam to be formed around each drop. The drops then will not touch the surface and will become dissipated slowly. It has been discovered in actual practice that this upper limit of temperature has been most marked, and that it has been quite impossible to run an engine when the vaporizer has become too hot.

Considerations of vaporizer temperature are therefore of great moment when designing their dimensions and weight. As the temperature rises and falls fairly readily with the heat supplied, it is therefore preferable to utilize some form which has a thermal storage of considerable capacity, as by such means, and such only, can vaporizer temperature be kept uniform and within reasonable limits.

#### Precipitation of Fuels.

If we can so design the radiating surfaces that the abstraction of heat by the fuel on its evaporation shall be practically equal to the transference of heat from the exhaust gases to the vaporizer itself, and that the thermal capacity shall be sufficient to allow the engine to run

light for such a period as might be met in ordinary practice, we shall have a vaporizer of a type suitable to overcome many of the difficulties pointed out in Mr. Allsop's article. He also points out that one of the greatest difficulties in connection with the utilization of kerosene is the precipitation upon the walls of the cylinder, or on the external surfaces of the induction pipe. This is the greatest difficulty we have to contend against, as, although one can conveniently produce a vapor of a very fine texture in a suitable apparatus, if one attempts to convey this moist vapor through tortuous passages, precipitation is bound to occur. The principal object, therefore, to be aimed at is the production of a gas at a low temperature, which is so fixed that upon coming in contact with cool surfaces there is no precipitation or condensation, and the vapor must retain its character throughout from the vaporizer to the inside of the engine cylinders.

Many of the difficulties, therefore, in connection with the utilization of kerosene disappear if we can produce such a vapor in a suitable apparatus, and in order to obtain the maximum volumetric efficiency, this vapor should be dry and at a reasonably low temperature. Furthermore, the vapor should remain at the same density from one moment to another under all conditions of working, and if such a vapor can be produced, we have simply the problem of the gas engine over again—that is, that of proportioning the amount of vapor to air to give the most satisfactory results.

### INCREASES CAPITAL STOCK.

#### Henderson Motor Car Company Adds \$200,000 and Three New Directors.

The Henderson Motor Car Company, Indianapolis, Ind., maker of the Henderson car, which has been offering the Harroun kerosene carburetor as optional equipment during the past season, has increased its capital by the addition of \$200,000 worth of stock. It is also announced that three prominent Indianapolis business men have been added to the directorate, these being Franklin Vonnegut, Arthur R. Baxter and A. R. Smith.

While no definite announcement has been made public, it is rumored in Indianapolis manufacturing circles that the company is to market a car to sell at a lower price and that an effort will be made to produce a line of kerosene burning machines.

### NEW MOTORING ASSOCIATION.

#### Organization to Provide Protection for Its Members While on the Road.

The American Motorists' Protective Association has been formed under the incorporation laws of New Jersey, which would seem to be all that its name implies. It aims to provide members with a certificate of credit reference to be used for identification or emergency credit at hotels, garages, etc.; with prompt attention, consideration and care in case of sudden disability or trouble while touring, this including legal and medical assistance; with special arrangements

with manufacturers, supply houses and garages to secure supplies, accessories and service at the lowest prices, and with indemnification from loss in whole or in part for money or necessities furnished fellow members when away from home.

The last paragraph of the prospectus deals with the detection, pursuit, apprehension, arrest or prosecution of motor car thieves, and the recovery of stolen automobiles. The association expects to create a legal and detective department, which will cover this feature in its entirety, and to provide members with special motorist's accident insurance. A department of chemical and mechanical investigation is to determine the merits of preparations, lubricants and mechanical attachments or devices offered to motorists.

### IMPORTS AND EXPORTS.

#### Former Decreased 50 Per Cent. in Value, While Latter Held Their Own.

The report of the bureau of foreign and domestic commerce, Department of Commerce, Washington, D. C., for the month of July, shows that 37 automobiles, valued at \$81,678, were imported into the United States this year as compared with 64 cars, valued at \$155,251, during the same month in 1912. The imports are not divided as to pleasure and commercial cars, but the report of exports shows 44 commercial cars, valued at \$103,612, and 1720 pleasure cars, valued at \$1,632,641, this year as compared with 78 commercial cars, valued at \$156,458, and 1557 pleasure cars, valued at \$1,546,179, last year. The total value of imports for the month shows a decrease of nearly 50 per cent., while the exports a little more than held their own. The tabulation according to countries follows:

|                         |      | Imports.    |      |             |  |

### NEW DOUBLE-BULB LIGHT.

#### Guide Lamp Company Brings Out Special Headlight Having Interesting Features.

A new type of electric headlight which presents interesting and practical features is announced by the

Guide Double-Bulb Headlight.

Guide Motor Lamp Manufacturing Company, Cleveland, O., a well known maker of automobile lamps. The special de luxe headlight, as it is called, is provided with two bulbs, one a large 16 candlepower member, located and operated in the conventional manner, and a smaller lamp. The latter is of two candlepower, and the semi-reflector, which is a part of the large parabola, is so constructed that the rays of the small bulb are thrown downward. This eliminates all glaring effects, conforms to the motor car light regulations in New York City, Chicago and other cities, and provides sufficient light for operating purposes.

The special de luxe has a 12-inch front with nickelled rim, black japanned body, Guide true parabolic reflector, and a curve or swell plate glass front. The same high grade material and workmanship for which the product of the company is noted is incorporated. Double wiring is employed. The design not only makes for economy of current in that the side lights may be eliminated, but it will appeal to motorists who desire to equip their machines with electric lighting. The Guide Motor Lamp Manufacturing Company is now located in its new factory, the facilities of which will enable the concern to produce the Guide line in considerably larger quantities.

### SERVICE WITH THE MOON.

#### Chicago Man Runs His Car 30,000 Miles at a Total Repair Expense of 17 Cents.

Half a cent for each 1000 miles of service is the repair record of a 30 horsepower Moon car

as reported to the maker, the Moon Motor Car Company, St. Louis, Mo., by S. M. Perrigo of Chicago. He says he drove his machine 30,000 miles, and the total amount he expended in repairs was 17 cents. "And I didn't need to spend that," he explains, "only I preferred a different style of oil cup." He now owns a 48 horsepower Moon, which he has driven over 4000 miles.

### ANOTHER KLAXON HORN.

#### Is Operated by Hand and Has Similar Note to Well Known Signal.

The Lovell-McConnell Manufacturing Company, Newark, N. J., maker of the well known Klaxon horn, announces a new signal which is manually operated. It is not entirely new, however, being a development of the original hand Klaxon, which was manufactured in 1909, and since then gradually discontinued, owing to the enormous demand for Klaxons operated by electricity.

The new member of the family is operated on the Klaxon principle of a vanadium steel diaphragm vibrated by a rotor or ratchet wheel. In the case of the electric horn this ratchet wheel is rotated by an electric motor; in the new horn, by a train of gears that attain a high speed under pressure on the pushrod. The hand signal has a true Klaxon note and is sold under the Klaxon guarantee of permanent satisfaction. The signal is moderately priced.

Orders will be accepted Nov. 1 and deliver-

Showing the Latest Member of the Klaxon Family, a Hand Operated Horn, Embodying Klaxon Principles.

ies will begin Dec. 1. The same high grade material and workmanship characteristic of the products of the Lovell-McConnell Manufacturing Company are incorporated in the new product.

## IN THE COMMERCIAL VEHICLE FIELD.

### Knox-Martin Tractor Is Being Utilized to Solve the Garbage Disposal Problem-- American Trucks Prove Superiority Over Foreign Design in Philippines.

**W**ITHIN the past few months the subject of garbage disposal, and the relation of the motor vehicle thereto, has been given consideration by a large number of American cities. The engineers of the Knox Automobile Company, Springfield, Mass., have been assisting some of these municipalities in experimenting with Knox-Martin tractors for this work.

In the Knox plan the horse carts collect the garbage from house to house, but instead of making the long, hard haul to the refuse plant, which usually is located in the outskirts of the city, each team draws its loaded wagon to a convenient junction point, where the body is jacked up at the forward end. The king pin is removed and the team with the forward axle is attached to an empty wagon, which has been jacked similarly and is in waiting. During the night, or any other convenient season, the tractor picks up these loaded wagons and hauls them to the refuse plant.

An additional advantage in this method is found in the fact that the wagons being covered, there is no objection concerning the odor and no dropping of particles of garbage, as is necessary where the load must be transferred from one vehicle to another, which is sometimes done to avoid the long haul with horses. It is also pointed out that there is considerable saving in economy, since one tractor can do the work usually done by several horses.

#### CLEANS OUT CATCH BASINS.

#### Standard Truck Does Work of Six Teams and 12 Men in This Service.

Commissioner Gill of the department of public works in Pawtucket, R. I., has devised a plan whereby a three-ton Standard truck, made by the Standard Motor Truck Company, Detroit, does the work of six horse carts and 12 men in clean-

ing out the catch basins of the city. Not more than three men are required to work the truck and accomplish the same results.

The chassis does not differ materially from that regularly supplied by the maker. The body was built by the Monahan Vehicle Company, Providence, R. I., and the mechanical details of the additional equipment were worked out by James Nesbit, who is in charge of the motor apparatus utilized by the department.

The entire outfit is designed to lower buckets into the sewer basin, there to be filled and then hoisted and dumped into the body of the vehicle.

Standard Three-Ton Chassis Fitted with Special Body for Cleaning Sewer Catch Basins.

When the latter is filled the machine is arranged to dump the entire load in 40 seconds, so that there is a material saving in time, as well as labor.

Directly back of the driver's seat is a two horsepower single-cylinder auxiliary engine, geared to a hoisting drum from which a cable is run through the centre of the crane and over pulleys on the arm. This engine draws its fuel supply from the same source as the regular motor which propels the truck, and the exhaust is arranged to communicate with the muffler. The water circulation is connected with the radiator

**Brown Combination Chemical Engine and Hose Wagon.**

so that the two engines utilize practically the same system. At the front of the body is an hydraulic hoist for dumping the load, this comprising a long cylinder with a piston forced upward by oil from a gear pump, which is driven by a connection in the transmission case.

#### **GLASS ROOFED MOTOR 'BUS.**

##### **Interesting Body Designed for Service Over Route of Paul Revere's Ride.**

The John Rockett Taxicab Company, Boston, Mass., has recently placed in service an interesting vehicle which will be operated as a sight-seeing 'bus over the route followed by Paul Revere on his memorable ride. The chassis is a standard 3000-pound White, made by the White Company, Cleveland, O., and the body was constructed to the specifications of the Boston concern.

The rear considerably overhangs the chassis frame and the interior is made to accommodate 22 passengers, the seats being arranged with an aisle between each except that at the back. There is but one entrance, this being at the right side, near the driver, and the entire machine is controlled from the inside. The driver is located at the left, and the steps are so

arranged that he may raise or lower them as required.

The body is surrounded by windows and the roof is also of glass, so that there is abundance of light and full opportunity for observation, no matter what the weather conditions may be. The roof is of so-called fireproof construction, being reinforced with wire, so that in the event of accident there could be no damage or injury from breakage. The side windows are removable, and when removed are carried in a compartment beneath the chassis frame.

#### **BROWN FIRE WAGON.**

##### **Particularly Well Adapted for Service in Smaller Cities and Towns.**

Those who are interested in the matter of securing fire protection in the smaller cities and towns, where the funds available are such that it is not deemed advisable to change any substantial proportion of the equipment from horse drawn to motor driven, cannot help but appreciate the advantages presented in the new Brown fire wagon, produced by the Brown Commercial Car Company, Peru, Ind. The vehicle is illustrated herewith and is a combination chemical engine and hose wagon, mounted on a light weight chassis.

The design and equipment is such that it is expected to take care of incipient blazes before they have reached serious proportions. The weight is an important factor in this connection, making it possible to cover a wide area from a central station, for instance, in quick time, bringing to the scene of the fire sufficient men and the character of apparatus needed to check the spread

**White 3000-Pound Chassis Fitted with Glass Roofed Sight-Seeing Body Designed for Service Around Boston.**

of flames or extinguish the blaze before the arrival of the slower going equipment. This is expected to make its appeal to the smaller cities and towns, although these advantages are such as to apply in any community.

### PEERLESS TRUCK IN PHILIPPINES.

#### Superiority to Foreign Machines Proven by United States Army Tests.

Because of the existing transportation facilities in the Philippine Islands, the United States Army has felt the need of relying upon motor vehicles for the distribution of supplies and materials from the headquarters of the department in Manila. Some little time since, a number of specially built French machines were purchased for this service, these being rated at two tons.

It was explained at the time that these cars were acquired because no American vehicles were available for such work. Naturally, this position was felt somewhat keenly by American manufacturers, and as a result of negotiations, the military officials were induced to give a three-ton Peerless truck, made by the Peerless Motor Car Company, Cleveland, O., a test under similar conditions to those obtaining with the French product.

The truck was assigned the duty of climbing Benguet hill, an exceedingly steep ascent, with varying loads. It consumed less fuel with three and four-ton loads than did the French two-ton machines. With all but the largest loads the truck was never operated on the low speed, and it did not heat excessively, though only two makes of touring cars have ever climbed the hill without stalling because of overheated motors. On one run with a load of 6340 pounds the truck made the distance in 3:20:00, which was faster than the train schedule.

It is not surprising, in view of these results, that the government purchased the only two Peerless trucks in stock in Manila, and negotiated for several others. The power of a truck that would carry an overload up a hill that no other machine had climbed with a full load, appears to have demonstrated sufficiently the quality of American machines, and probably has ended a demand by the army for foreign trucks for service in the Philippines.

Earl Jackson, in a Reo, made by the Reo Motor Car Company, Lansing, Mich., recently defeated a field of six in a free-for-all road race between Virginia, Reno and Carson City, Nev. It is stated that the winning car already has covered

**Peerless Three-Ton Truck Which Underwent Successful Competition Test with French Machines in Philippines.**

35,162 miles in the service of the Western Pipe & Steel Company, over all sorts of roads in the San Joaquin valley, California.

A Cartercar, made by the Cartercar Company, Pontiac, Mich., driven by Fred Pentecost of the Washington Cartercar Company, finished the recent Post-Intelligencer tour in Seattle, Wash., with a perfect score. This is the first contest of any kind in which this make of machine has appeared in the Northwest.

Louis Noel, piloting a 120 horsepower Grahame-White biplane, established a new world's record for duration of 19:47, with nine passengers at the Hendon flying field, Oct. 2.

## IN THE REALM OF THE MOTORCYCLIST.

### President Patterson Acted Legally in Declining to Issue Brooklyn Call—Bcsch Trophy Award to Be Decided in Chicago—Racing and Club News.

**I**N REPLY to a request that he give his views concerning the refusal of President Patterson of the Federation of American Motorcyclists, to call a meeting of the national assembly in connection with the proposed celebration of the organization's birthday in Brooklyn, N. Y., last month, Director W. M. Johnson of Chicago, who is a lawyer, has prepared a lengthy document setting forth that not only did the president's action have the approval of nearly every member of the board

been "to complete the unfinished business of the convention held in July, 1913, and to consider other matters", the latter not being specified. It further appears that the unfinished business of the July convention had already been referred by that convention to the board of directors. Among the other points raised by Mr. Johnson are the following:

The constitution is the fundamental law of the body and is adopted by the members. The bylaws are rules and regulations, for the orderly and convenient transaction of its affairs, enacted by the directors, always, however, subject to the organic law and limitations laid down by the constitution. Where unauthorized by the constitution, such bylaws are of no binding force upon anyone. No greater rights can be conferred upon the members by the bylaws than are conferred by the constitution. By article 2 of the constitution, the annual meeting must be called by the board of directors. By article 6, it is provided that the constitution may be amended, at a special meeting of the assembly called for that purpose. These are the only constitutional provisions, by force of which meetings of the national body are or may be called. In view of the widely scattered membership and the financial and other considerations, in their nature opposed to frequent meetings of the assembly, it is evident that these provisions were inserted intentionally, and with the manifest purpose to limit the meetings to annual sessions, the directors to care for its affairs meantime.

Even under this bylaw the petition could not in fairness be granted. The objects and purposes as a whole were not such as could be considered at a special meeting of the assembly. By the constitution the only subject that could be considered was an amendment to the constitution. Taking advantage of the fact that no notice of such meeting was expressly required, the petitioners filed the petition with the president, Aug. 9, 1913, and set the time so that notice in the motorcycle journals of 30 days could not be given. This is the shortest notice mentioned, and is the method designated, wherever the question of notice arises, by the constitution or bylaws. The petition assumed to fix the date and place of the proposed meeting. These matters are solely

within the discretion of the president, even under this bylaw.

#### Recent F. A. M. News.

The board of directors of the Federation of American Motorcyclists has voted that after Oct. 1 the secretary-treasurer shall keep a record of the receipts for memberships and renewals, placing to the credit of all properly organized states, 25 cents of each new member and renewal money fee, said sums to be drawn upon by the proper state commissioner with the O. K. of his district

**Fred Karl, Canal Dover, O., and Flying Merkel He Has Ridden Nearly 40,000 Miles.**

of directors, but was perfectly right and proper when viewed as to its strict legality. Those who are seeking to compel the resignation of President Patterson claim that he violated article 9, section 8 of the bylaws, which reads as follows:

The president shall call a special meeting of the national assembly upon the written request of any 25 members, said request to state the object or objects of such meeting.

It appears from Director Johnson's brief that the object of the proposed meeting was to have

A. P. Madison, Lynn, Mass., and His Pope.

vice president; the different state apportionment moneys to remain in the hands of the national treasurer until drawn upon.

In relation to the recent court hearing in the District of Columbia, regarding the tandem law, the F. A. M. contributed \$50 during the earlier court proceedings, and although asked

for \$50 more on the appealed case, did not feel it could place a larger sum in any one locality. At the hearing just completed, in which the motorcyclists were successful, the F. A. M., through Director French, had a great deal to do with the conclusion of the case, which is looked upon as a good precedent.

The Federation Internationale des Clubs Motorcyclists, of which the F. A. M. is one of the 11 components, will have a conference in Paris, France, Oct. 25. It is expected that the American organization will be represented by a member residing in London, England.

President Patterson has appointed F. W. Sullivan, 420 South Winnebago street, Rockford, Ill., as state commissioner, and reappointed R. S. Pascal, 270 South Sixth street, Newark, N. J., in the same capacity. Local commissioners have been appointed by State Commissioner Campbell of Ohio as follows: Lorain, C. B. Tunte, 539 Broadway; Kent, M. E. Ellis, 107 Portage street; Bedford, Herbert Myers; Lucas county, A. G. Weiler, 145 Michigan street, Toledo; Calion, A. B. Diamond, Public square; Chagrin Falls, William Zoul; Laura, William Strickler; Mt. Gilead, C. W. Ewers.

Clubs have recently affiliated with the federation as follows: Norwich, Conn., C. V. Pendleton, Jr., 35 Broadway, 14 members (reaffiliation); San Angelo, Tex., Noah Smith, 320 South Oaks street, 15; Manitowoc County, Manitowac, Wis., L. F. Wagner, 32.

The following new registered repair shops have been announced: Fred E. Field, 44 Bridge

street, Catskill, N. Y.; Huter & Bishop, 107 St. Paul street, Dallas, Tex.; Joseph Candioto Company, 151 North Broadway, Lexington, Ky.

#### Flying Merkel Economy.

Fred Karl of Canal Dover, O., whose picture is shown herewith, purchased this six horsepower Flying Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O., in 1911. Since that time he has ridden it 39,890 miles, a record of which both he and the manufacturer may well be proud. Mr. Karl reports that his only mechanical expense has been \$1.50 for two new intake valves. His first belt lasted him a little over 13,000 miles. The second belt is still on the machine. His tire record to date consists of three new rear tires and two on the front.

#### The Bosch Trophy Award.

In view of the attention which has been drawn to the fact that the Bosch trophy, offered annually by the Bosch Magneto Company, New York, to be competed for in connection with the national amateur championship races of the F. A. M., has not been awarded this year because of the failure to run off the 50-mile event, the only remaining contest of the series, John L. Donovan, 819 Ashland block, Chicago, chairman of the F. A. M. competition committee, announces that he has issued a sanction for this race to the

## ALWAYS READY FOR ANY EMERGENCY!

With its ability to pick up speed quickly—(60 miles an hour from a standing start within a city block)—the 1913 Flying Merkel Motorcycle is always ready for instantaneous use. These features and the fact that the Flying Merkel Motorcycle is the most economical in the world to operate has led to its universal adoption by Police Departments, Park Boards, Gas Companies, Telephone and Electric Light Companies and all other business concerns and individuals whose requirements demand a sturdy, reliable motorcycle at the minimum cost of upkeep. Remember, the Flying Merkel

## The Miami Cycle & Mfg. Co.

320 Hanover St.

Middletown, Ohio, U. S. A.

North Shore Motorcycle Club, Chicago, Ill., to be run on the Hawthorne track, Nov. 2.

#### Cross Country Sidecar Trip.

Among the recent visitors to the factory of the Hendee Manufacturing Company, Springfield, Mass., maker of the Indian, were Mr. and Mrs. H. J. Tucker, Akron, O., who were on their way to Boston and return, a distance of 1900 miles, on an Indian with sidecar attachment.

Others who have paid their respects lately under similar conditions are Mr. and Mrs. Corson, Baltimore, Md., who were on their honeymoon; W. E. Cornell, Los Angeles, Cal.; Robert Stubbs, Birmingham, Ala.; Walter Goerke, Newark, N. J.; H. M. Kipp, Toronto, Can.; Earl O. Myhill, Medina, N. H.; J. W. Brown, Trotville, N. C., and W. H. Hells, London, England.

#### Harley-Davidson Man Weds.

Announcement is made from Milwaukee,

orado and Minnesota, three each; California, Nebraska and Oklahoma, two each; Maine, New Hampshire, New Jersey, Alabama and Kentucky, one each.

#### Hendee Company Reorganized.

At a meeting of the stockholders of the Hendee Manufacturing Company, Springfield, Mass., maker of Indian machines, Oct. 7, the assets were transferred to a new company to be known as Hendee Manufacturing Company, and the old concern passed out of existence. The new concern is capitalized for \$12,500,000, representing an increase of \$10,000,000, which is the amount of common stock, the remaining \$2,500,000 being preferred.

#### Convention of Merkel Managers.

An accompanying illustration presents a number of district managers, who attended the recent semi-annual convention at the factory of the Miami Cycle & Manufacturing Company, Middletown, O. After inspecting the new models of the Flying Merkel, the visitors were taken on an automobile ride by President K. R. Jacoby and Secretary J. W. Ash to the new branch factory in Indianapolis, Ind. Standing from left to right in the picture are the following: F. P. Lee, western district; Weston Kent Thomas, eastern district No. 1; William McKinley Sheets, eastern district No. 2; J. W. Ash, secretary; John Henry Newberry, central northern district; C. A. Van Doren, New England; K. R. Jacoby, president, and R. W. Sayre, Los Angeles jobber. They were

Merkel Officials and District Managers at Recent Convention in Middletown.

Wis., that Edward J. Mueller, office manager of the Harley-Davidson Motor Company, and president of the Milwaukee Motorcycle Club, slipped out of town Sept. 10 and was quietly married. Mr. and Mrs. Mueller were somewhere near Fort Wayne, Ind., when the remainder of the Harley-Davidson force became aware of what had transpired.

#### New Members in September.

Secretary-Treasurer G. B. Gibson of the Federation of American Motorcyclists announces that 314 new members were added to the list during the month of September, and that the last card issued during the month was numbered 24,849. The additions, according to states, follows:

New York, 51; Ohio, 30; Wisconsin, 29; Pennsylvania, 21; Illinois, 19; Texas, 19; Kansas, 18; Connecticut, 16; Oregon, 12; Massachusetts, 10; Indiana, nine; Maryland, eight; Montana, seven; Missouri, seven; District of Columbia, six; Rhode Island, six; Michigan, six; South Dakota, five; Tennessee, Florida and Iowa, four each; Col-

all satisfied the prospects for 1914 were bright.

#### Popes, Not Thors.

In connection with a story concerning a foreign trip, recently completed by Stanley F. Withe and Walter McKim, in the issue of The Automobile Journal for Sept. 25, it was stated that the machines ridden were Thors. It transpires that this information was incorrect, as the young men rode 1913 Pope twins.

#### Recent Racing Results.

The following summaries indicate the results in recent race meets throughout the country:

##### Toronto, Can.

Three miles, novice—First, Armstrong, Excelsior; second, Bowden, Indian; third, Hands, Indian; time, 4:11.

Three miles, professional—First, Gardiner, Excelsior; second, Jones, Merkel; third, McIntosh, Indian; time, 3:42.2.

Ten miles, amateur—First, Duff, Indian; second, Hadley, Indian; third, Armstrong, Excelsior; time, 13:10.

Ten miles, professional—First, Jones, Merkel; second, McIntosh, Indian; third, Gardiner, Excelsior; time, 12:20.6.

Three miles, amateur—First, Duff, Indian; second, Murray, Indian; third, Armstrong, Excelsior; time, 4:19.6.

Five miles, amateur, championship—First, Murray, Indian; second, Hadley, Indian; third, Friend, Indian; time, 6:34.2.

Fifteen miles, professional—First, Gardiner, Excelsior; second, Jones, Merkel; third, McIntosh, Indian; time, 18:37.6.

#### Rock Island, Ill.

Five miles, free-for-all—First, Stickney, Merkel; second, House, Thor; time, 7:00.

Five miles, stock—First, Schieb, Excelsior; second, Stickney, Merkel; third, Sarginson, Merkel; time, 6:47.

Three miles, free-for-all—First, Stickney, Merkel; second, Schieb, Excelsior; third, Williamson, Merkel; time, 4:00.

#### Lowell, O.

Three miles, professional—First, Snyder, Merkel; second, Williams, Indian; third, Wells, Indian; time, 4:41.2.

Five miles, professional—First, Williams, Indian; second, Snyder, Merkel; third, Wells, Indian; time, 5:58.2.

#### Coldwater, Mich.

Three miles, singles—First, Miller, Excelsior; second, Abrams, Excelsior; third, Cook, Excelsior; time, 5:06.

Five miles, twins—First, Hatch, Dayton; second, Woodward, Excelsior; time, 7:09.

Five miles, twins—First, Bailey, Excelsior; second, Titus, Excelsior; third, Ogden, Indian; time, 7:17.

Five miles, singles—First, Miller, Excelsior; second, Wheeler, Pope; third, Abrams, Excelsior; time, 8:20.

Two miles, novelty—First, Bailey, Excelsior; second, Randall, Excelsior; third, Titus, Excelsior; time, 3:22.

Seven miles, twins—First, Titus, Excelsior; second, Ogden, Indian; time, 10:20.2.

Ten miles, twins—First, Doolittle, Excelsior; second, Woodward, Excelsior; time, 15:25.

#### Zanesville, O.

Three miles—First, Williams, Indian; second, Snyder, Merkel; third, Ponti, Indian; time, 4:48.6.

Five miles—First, Williams, Indian; second, Snyder, Merkel; third, Ponti, Indian; time, 6:26.4.

Three miles, miss-and-out—First, Snyder, Merkel; second, Evans, Indian; third, Ponti, Indian; time, 3:49.6.

Ten miles—First, Evans, Indian; second, Williams, Indian; third, Ponti, Indian; time, 12:58.6.

Five miles, pursuit—First, Evans, Indian; second, Snyder, Merkel; third, Amos, Merkel; time, 5:29.2.

#### Indianapolis, Ind.

Ten miles, handicap—First, Baker, Indian; second, Hoffstatter, Excelsior; third, Ellis, Indian; time, 9:35.

Five miles, side cars—First, Merz, De Luxe; second, Ellis, Indian; third, Milner, Indian; time, 7:24.

One hundred miles, open—First, Baker, Indian; second, Birkenbach, Thor; third, Shaffer, Excelsior; time, 1:37:07.2.

#### Marion, Ind.

One hundred miles—First, Rowe, Thor; second, Hagen, Harley-Davidson; third, Thompson, Indian; time, 2:28:45.

#### Club Notes, Here and There.

The Savannah Motorcycle Club, Savannah, Ga., is arranging a 300-mile race for Christmas Day over the 12-mile Grand Prize automobile course. The committee in charge consists of O. A. Meyer, Frank T. Laird, Martin Schroeder, W. S. Carraway and J. S. Balmer.

Three hill climbing events were run off by the Providence Motorcycle Club, Providence, R. I., Sept. 28, with the following results: Free-for-all—First, J. C. Garand; second, C. Anderson; third, E. G. Luber. Four horsepower machines—First, Sam Litterio; second, A. Houle; third, F. H. Williams. Seven horsepower—First, J. C. Garand; second, J. G. Edwards; third, C. A. Anderson. With the exception of Williams, all rode Indians. His mount was a Harley-Davidson. The Triangle run has been postponed to Oct. 12 on account of rain.

The Toledo Motorcycle Club, Toledo, O., held an endurance run, Oct. 4-5, the schedule including Lima, Dayton, Bowling Green, Findlay, Sidney, Springfield, Columbus, Marion and Fostoria.

Several Connecticut riders assembled at Rockville last month and took action looking toward a state race meet at Norwich during October.

The Niagara Falls Motorcycle Club, Niagara Falls, N. Y., which was organized in June, now has a membership of 64, and plans to erect a club house in which to enter-

tain motorcycle tourists visiting that section. The officers are: President, Homer Cumberland; vice president, Albert A. Weinkie; secretary-treasurer, Joseph A. Mackenna; captain, William J. Coleman.

The Worcester Motorcycle Club, Worcester, Mass., held its annual banquet Sept. 24, covers being laid for 33. During the evening prizes were awarded to those holding the highest scores in the 24-hour endurance run in June.

The New Britain Motorcycle Club, New Britain, Conn., has plans for a theatre party and banquet in the near future.

Thirteen members of the Greenfield Motorcycle Club, Greenfield, Ind., recently took a trip to the southern part of the state, visiting Indianapolis, Bloomington, Nashville, Columbus, Edinburg and Shelbyville.

Members of the Buffalo Motorcycle Club, Buffalo, N. Y., recently entertained visiting riders from the clubs in Malta, Lockport and Niagara Falls.

The Harley-Davidson Motorcycle Club of Philadelphia has elected the following officers: President, George

Mr. and Mrs. H. J. Tucker, Akron, O., and Their Cross Country Indian Equipment.

O'Malley; vice president, Howard Kolp; secretary-treasurer, Lockwood Campbell; recording secretary, Armon Gruel; captain, John Selfert; first lieutenant, John Hiltelbe; second lieutenant, E. Crook; directors at large, Julius Klein and Alexander Klein.

The Garden City Wheelmen of San Jose, Cal., which has existed for 27 years as a bicycling organization, has changed its name to the Garden City Wheelmen & Motorcycle Club.

Thirty-one out of 32 starters finished in the recent 125-mile run of the Maryland Motorcycle Club of Baltimore, Md. The nine prizes were awarded in the following order: Lewis Franklin, Harley-Davidson; Walter Trappe, Harley-Davidson; Walter Fairley, Harley-Davidson; C. C. Cason, Indian; Clayton Sandruck, Flying Merkel; P. E. Ibe, Indian; L. H. Gilpin, Eagle; Gus Heinz, Harley-Davidson; Frank Fertita, Yale; H. Shipley, Indian.

# NEWS OF THE MANUFACTURER AND DEALER.

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

**Allen & Cleaveland Motor Company**, Los Angeles, Cal.; \$3,500,000; S. T. Allen, G. A. Cleaveland, Jr., J. H. Crube, J. M. McDonald.

**Automobile Realization Company**, Chicago, \$90,000; to deal in automobiles and accessories; A. B. Johnston, G. B. Smith, G. F. Matthis.

**Auto Salvage Company**, Kansas City, Mo.; \$12,000; Claude S. Peck, Bessie G. Peck, W. R. Chamberlain.

**A. V. Specialty Company**, Suffolk, Va.; to manufacture and sell Nurney auxiliary air valve; A. C. Nurney and others.

**Bowling Green Rubber Company**, Bowling Green, O.; \$25,000; to manufacture tires; C. W. Greene, M. L. Cope, C. P. Cope, Loren Campbell, Mont Clouse.

**Cash Automobile Company**, Darlington, S. C.; \$1000; C. C. Vaughn, G. B. Brasington, J. B. Blackwell.

**C. A. Chambers Company**, Indianapolis, Ind.; to deal in motor trucks.

**Cincinnati-Velle Motor Sales Company**, Cincinnati, O.; \$5000; W. S. Schmidt, C. B. Groesbeck, J. J. Fauth, Elmer Strategus, J. J. Grogan.

**Caldwell Garage & Machine Shop**, Caldwell, N. Y.; \$25,000; F. W. Klein and others.

**Columb Tyres Import Company**, New York City; \$50,000; H. Ray Paige, A. C. Kahler; 1789 Broadway.

**Moon Sales Company**, Bridgeport, Conn.; \$15,000; Barnith Sachs, Henry H. Drucker, Samuel B. Drucker.

**Motor Shop**, 636-640 East State street, Trenton, N. J.; \$25,000; Robert C. Manning, Jr., Joseph L. Bodine, Walter S. Cox, Jr.

**Motor Transportation Company**, 62 South street, Morristown, N. J.; \$20,000; to operate motor vehicles from Morristown to Madison; Edward P. Guerin, Jared T. Little and others.

**Mutual Taxicab Company**, Pittsburg, Penn.; \$10,000; Antonio Floecker, C. E. Meyer, M. J. Dain.

**New Jersey Sales Company**, Newark, N. J.; \$10,000; to do a general automobile business; Robert M. Olyphant, Jr.; Charles E. Macker, Rupert W. K. Anderson.

**Pacific Motor Coach Company**, Los Angeles, Cal.; \$500,000; T. Y. Drake, W. H. Bradrick, J. L. Stone, A. B. Miner, L. D. Collings, C. O. Bacon.

**Pontiac Motor Car Company**, Pontiac, Ill.; \$25,000; I. A. Morrison, C. F. Taylor, E. Hoobler.

**Portland Auto Specialties Company**, Portland, Me.; \$5000; Frederick M. Smith, Anna T. Graham, Frank H. Purinton.

**Premier Auto Novelty Manufacturing Company**, New York City; \$15,000; automobile accessories; Harry G. Kosch, Hyman Cohen, Charles Welland; 194 Riverside drive.

**Princess Cyclecar Company**, Detroit, \$200,000; Isaac N. White, Herbert H. Dawson and others.

**Staunton Automobile Livery & Transfer Company**, Staunton, Va.; \$25,000; president, N. C. Williams; secretary, T. M. Hoopes.

**Stewart Transportation Company**, Perth Amboy, N. J.; \$2000; Walter K. Whitaker, Raymond S. Meyers and others.

**Taylor Auto Auxiliary Spring Company**, Los Angeles, Cal.; \$10,000; C. F. De Shields, J. R. Tooley, H. H. Bailey.

**Texas Motor Truck Company**, San Antonio, Tex.; \$10,000; William H. Smith, Marvin Trice, S. Burg.

**United States Garages**, New York City; \$500; J. H. Herman, Jr., H. D. Bristol, Rose Simon.

**Paul Wargny & Co.**, Chicago; \$2500; to deal in automobiles, etc.; Gustav Mueller, Paul Wargny, Sidney B. Meyer.

**Wilmont Automobile Company**, Minneapolis, Minn.; \$10,000; to conduct a garage and repair shop.

**Wilson Engineering Company**, Buffalo, N. Y.; \$20,000; C. G. Hulbert, W. F. Gagnon, W. H. Pfeiffer.

**Zin Cyclecar Company**, Rock Island, Ill.; \$25,000; factory, Davenport, Ia.

## GARAGE AND DEALER.

**The Nichols Tire & Rubber Company**, recently incorporated in New York City, has become eastern distributor

for Knight tires, made by the Knight Tire & Rubber Company, Canton, O.

**The Andrews-Dykeman Company**, Boston, Mass., has established itself in a new salesroom and service station at 43 Warren avenue.

**The Auto Distributors Company**, Logansport, Ind., agent for Cole and Paige cars, has moved to 310 Broadway.

**The Cartecar Wisconsin Company**, Milwaukee, Wis., has removed from 222 Fourth street to a new fireproof garage at 2713 Grand avenue.

**A. L. Fordan**, manager of the California Auto & Supply Company, Santa Barbara, Cal., and agent for Studebaker cars, has taken the garage at Hollywood, Cal.

**The Goodyear Tire & Rubber Company's** branch in Indianapolis, Ind., is soon to remove to a new building on North Capitol avenue.

**The Keeton Motor Car Company**, Chicago, has taken a lease of the premises at 2025 Michigan avenue.

**J. W. Leavitt & Co.**, Seattle, Wash., distributor for Overland cars and Gramm trucks, has opened its new garage at 11th avenue and East Pike street.

**The La France Garage Company**, Elmira, N. Y., is located temporarily at 251-257 West Water street, pending the completion of its new building at Baldwin and Church streets.

**The Motor Parts Company**, Boston, Mass., has opened a branch at 143 Chestnut street, Springfield, Mass. The concern has the New England distributing agency for Bosch magnetos.

**The Eugene Polk Motor Car Company**, successor to the J. T. Lloyd Company, as distributor for White and Studebaker cars in Arkansas, has located in new salesrooms at Fourth and Center street, Little Rock.

**The St. Louis KlaseiKar Company**, St. Louis, Mo., has leased the building at 304 North 12th street and will locate there.

**The J. T. Stubbs Company**, Providence, R. I., agent for Henderson and National cars, has taken the entire building at 70 Mathewson street.

**The Velvet Company**, recently incorporated in New York City, will handle the distribution of Velvet shock absorbers and operate a service station for that city and vicinity. Headquarters have been opened at 74th street and Broadway. The officers are: President, H. O. Proctor; secretary, A. H. Miller; treasurer, W. D. Ramsburgh.

**The Whitten-Gilmore Company**, after having been located at 907 Boylston street, Boston, Mass., since 1907, has removed to a new building at 620 Commonwealth avenue.

**Ray Wilmouth**, River Falls, Wis., has opened a repair shop in F. M. Ulrich's garage on Main street.

**The Breen Motor Company**, Winnipeg, Man., has contracted for \$500,000 worth of Studebaker cars for distribution during 1914 in Manitoba and other sections of the Canadian Northwest.

**The Edisto Automobile & Machinery Company** has been organized in Orangeburg, S. C., to handle automobiles and operate a general repair shop. The concern will erect a brick building, 50 by 150 feet, on West Rutland street.

**Clinton B. Lamson**, formerly connected with the Flint Oil Company, Providence, R. I., has associated himself with C. F. Drake under the firm name of the Lamson Oil & Supply Company, located at Broadway and Fountain street. The concern will carry a full line of Apco Ford specialties and Vacuum Mobilolis.

**The Lane-Lynch Motor Company**, St. Louis, Mo., has changed its name to the Stutz Motor Sales Company. R. W. Immasche is in charge as manager.

**The Miller Tire Sales Company**, New York City, has secured a location at 256 West 55th street, where it will handle the eastern distribution of Miller tires.

**The John V. Wilson Company**, manufacturers' selling representative of automobile and motorcycle equipment, has offices in Philadelphia and Boston, that in the latter city being located at 220 Motor Mart. The concern handles a wide line of well known goods, among which may be mentioned: Rhineland Machine Works Company's Rhineland ball bearings, A. V. shock absorbers, Lindhe laminated shim brass; Auto Parts Company's Apco Ford specialties; Dean Electric Company's Tuto, Rexo and Maxo electric horns, Dynalux lighting dynamos; N. Y. & N. J. Lubricant Company's Non-Fluid and Motorol oils; Fulton Company's Aermore exhaust horn, Rogers sidecar, Sabo

# Tarvia

*Preserves Roads  
Prevents Dust-*

Wade Park, Cleveland, Ohio. Treated with "Tarvia A."

## Cleveland's Experience with Tarvia

CLEVELAND'S experience with Tarvia has been very satisfactory. Tarvia has been used on the various roads in the parks and in the boulevard system. The following is taken from the Annual Report of the Department of Public Service:

"On the West Side, Edgewater Park and the Boulevard, the roads were treated two years ago with a surface coating of Tarvia and hence only needed a renewal coating of the same material with silica sand. This renewal cost was quite small and the results satisfactory. We would recommend a similar periodical recoating for the East Side roads about every other year.

"The results we have secured from the methods of resurfacing and repairing, as above set forth, are such that we hope the general plan may be continued on the

park roads not already repaired. This form of construction offers a hard, resisting surface to traffic and thoroughly preserves the road, whereas, in our opinion, the normal disintegration of the macadam roads has heretofore been hastened by oiling. The oil seems to be lacking in binding quality and tends to break up the macadam surface."

"Tarvia X" is a dense, viscid coal tar product of great cohesive and bonding power for pavement and road construction. "Tarvia A" and "Tarvia B" are lighter materials of the same nature for dust suppression and road preservation. "Tarvia X" and "Tarvia A" require heat for application. "Tarvia B" is applied cold. As a rule a tarviated road lasts so much longer than ordinary macadam that the cost of the Tarvia treatment is more than saved.

### BARRETT MANUFACTURING COMPANY

New York Chicago Philadelphia Boston St. Louis Kansas City Cleveland  
Cincinnati Minneapolis Pittsburgh Seattle Birmingham  
THE PATERSON MFG. CO., Ltd.:—Montreal Toronto Winnipeg Vancouver St. John, N. B. Halifax, N. S. Sydney, N. S.

When Writing to Advertisers, Please Mention The Automobile Journal.

motorcycle locks, convertible tools; Jeffery-Dewitt Company's Rellance, J-D and Standard spark plugs; Fulton-McCutchan Company's K-C inner tires and sundries, Victor lamps and metal boxes, Lyndon speedlers and Ford specialties.

#### WITH THE MANUFACTURERS.

**P. J. Feely**, until recently automobile editor of the Portland Oregonian, has become assistant to Homer McKee, director of sales and advertising for the Cole Motor Car Company, Indianapolis, Ind., in charge of the Cole Bulletin.

**Edward T. Klee**, formerly with the Gibson Automobile Company, Indianapolis, Ind., has become service expert for the Stutz Motor Car Company of that city.

**J. C. MacFadyen** has been selected by the Goodyear Tire & Rubber Company to superintend the erection of its \$1,300,000 plant in Rio de Janeiro, Brazil.

**Robert Perkins**, Minneapolis, Minn., formerly with the Gemmer Manufacturing Company, has purchased the Massnick Phillips Manufacturing Company in that city, and will produce motors for cyclecars.

**C. T. Schaefer**, formerly connected with the Palmer-Meyer Motor Car Company, St. Louis, Mo., has been engaged to design a new two-ton truck for the Mogul Motor Truck Company of that city.

**J. M. Van Harlinger**, traffic engineering expert for the

Chicago, Ill., calls attention to the fact that the name of its Velvet auxiliary springs has been changed to Velvet shock absorber. The general officers of the company are located at 2110 Michigan avenue, Chicago, while the New York branch, which looks after the trade in the East, is at 74th street and Broadway.

**The Abbott Ball Company**, Elmwood, Hartford, Conn., has awarded the contracts for a one-story addition to its plant.

**G. L. Berg**, Seattle, Wash., has invented a new headlight, termed the Pathfinder, and a company has been organized with capital stock of \$35,000. William Piggott and G. D. Colwin are associated with him in the enterprise.

**Charles H. Besley & Co.**, Beloit, Wis., has broken ground for new buildings which will triple the size of its shops. The concern produces grinding and polishing machines.

**The Board of Trade**, Waterloo, Ia., is negotiating with the Denver Motor Truck Company, Denver, Col., to locate its gasoline-electric truck plant in that city.

**The John W. Brown Manufacturing Company**, Columbus, O., has started work on additions to its plant for the manufacture of lamps for Ford cars.

**The Baker Motor Vehicle Company**, Cleveland, O., had an interesting and instructive exhibit in the recent Perry centennial celebration in that city. Over 1000 automobiles were in line and at the head of the division was a delegation of Baker electric models, one for each year

**Baker Electric Models in Perry Centennial Parade, Cleveland, O., Headed by First Machine Made, Driven by Oldest Employee of Company Costumed as Father Time.**

International Motor Company, New York City, has resigned to go into business for himself as an expert truck and transportation adviser.

**The American Semi-Turbine Motor Company**, St. Louis, Mo., has been organized to produce a new internal combustion, coal oil burning engine for motor vehicles.

**The Firestone Tire & Rubber Company**, Akron, O., reports that the gross earnings of the company during the last fiscal year were approximately \$15,000,000, as compared with \$11,500,000 during the same period in 1912. The net profits were \$1,600,000, and the surplus, \$1,250,000. According to the balance sheet the current assets of the company were \$7,000,000.

**The Ford Motor Company**, Detroit, has opened a South American selling and service branch in Buenos Aires. E. H. Hampton will be in charge as manager.

**The Hampton Kerosene Carburetor Company**, New York City, has secured property for a factory site at the foot of Gordon street, Perth Amboy, N. J.

**The Lozier Motor Company**, Detroit, reports that the directors have subscribed for \$500,000 of the company's stock in order to finance the increased operations planned for 1914.

**The Mercer Automobile Company**, Trenton, N. J., maker of Mercer cars, is issuing a house organ under the title of Mercer Magic. W. A. Smith, advertising manager, is director of the new publication.

**The John W. Blackledge Manufacturing Company**,

of the company's existence. The oldest machine made, in 1899, was in the lead, and this was driven by the oldest employee of the company, costumed as Father Time.

**The Bundy-Goebel Manufacturing Company**, has been formed in Detroit for the production of the Tell Tale, a gasoline gauge.

**The Chicago Pneumatic Tool Company**, Chicago, has declared a quarterly dividend of one per cent., payable Oct. 25.

**The Cincinnati Car Company**, Cincinnati, O., is to erect an assembling depot near its main plant on Spring Grove avenue at a cost of \$30,000.

**The Columbus Auto Parts & Machine Company**, Columbus, O., is to place a collapsible top on the market, through the J. P. Gordon Company, North Fourth street, as distributor.

**The Pacific Motor Manufacturing Company**, 2610 South Main street, Los Angeles, Cal., has begun the production of a four-cylinder, air-cooled, T head motor for cyclecars. It has a contract for 300 automobile engines for the Perfection Motor Car Company.

**The Page Fence Company** is said to be interested in locating a windshield factory in Adrian, Mich., in charge of E. K. Conover of New York City.

**The Patterson Rubber Company**, which recently began the manufacture of tires, etc., at Lowell, Mass., announces that it will soon erect a new factory providing for an output of \$2,000,000 yearly.

**Unexcelled American Genius  
Unexcelled American Skill  
Unexcelled American Manufacturing Processes**

have produced the Unexcelled, American-made, New Departure ball bearing—the bearing that has proved its superiority by actual service in 80 per cent. of American-made motor cars.

**Three Types:**

**Double Row**—A two-purpose bearing of maximum capacity for both radial and thrust loads.

**Single Row**—For radial loads only. An improved separator is an advantageous feature.

**Radax**—High grade cup-and-cone type bearing for sustaining radial loads and one-direction thrusts.

Descriptive catalog will be sent on request.

Engineering consultation service at your command. Send us your blueprints, speed and load data and we will tell you what size and type of bearing will best do your work with greatest efficiency and least friction and wear.

"Elimination of Friction" brochure, now in third edition, discusses the relative merits of balls and rollers in bearing work. A copy will be sent you free on request.

**The New Departure Mfg. Co.**

## RECENT PATENTS.

- Motor Plow**, Leslie S. Hackmey, St. Paul, Minn. No. 1,074,115. Filed Sept. 19, 1910.
- Gaseous Fuel Mixer**, Willis S. Parker, Philadelphia, Penn., assignor to Delomont E. Notley and Willis S. Parker, copartners, trading as the Parker Manufacturing Company of the same city. No. 1,074,136. Filed June 11, 1913.
- Vehicle Spring**, Lewis A. Huston, New York City. No. 1,074,178. Filed July 28, 1913.
- Valve Seat**, John Henry Mixer, Shale, Cal. No. 1,074,191. Filed June 20, 1912.
- Hood of Motor Cars**, Anton Aumuller, Munich, Germany. No. 1,074,232. Filed May 6, 1912.
- Spring Wheel**, Roddie C. Behrends, Easton, Ill. No. 1,074,235. Filed Jan. 2, 1912.
- Lock for Automobiles**, Albert Austin Bennett, Los Angeles, Cal. No. 1,074,238. Filed June 10, 1913.
- Igniter**, Edwin Charles Jones, Toronto, Ontario, Canada, assignor of one-half to James Pearson of the same city. No. 1,074,265. Filed March 25, 1913.
- Spring Wheel**, Samuel James Poyner, Pierson, Manitoba, Canada. No. 1,074,290. Filed Sept. 3, 1912.
- Device for Stopping Engines**, Tom Elmer Johnson, Northwood, Ia. No. 1,074,327. Filed Sept. 21, 1912.
- Gearing for Motor Vehicles**, Eugene Harold Avery, Bradgate, Ia. No. 1,074,341. Filed Oct. 19, 1911.
- Automobile Horn**, Ray H. Manson, Elyria, O., assignor to the Dean Electric Company of the same place. No. 1,074,371. Filed May 6, 1912.
- Lap Robe**, George Sullivan, New York City. No. 1,074,389. Filed May 19, 1911.
- Magneto Ignition System**, John M. Dinkins and Franklin B. Hayes, assignors of eight-fifteenths to William Taylor, all of Indianapolis, Ind. No. 1,074,416. Filed June 5, 1908.
- Seat for Motorcycles**, Frank G. Kimpel, Edgerton, O. No. 1,074,438. Filed May 20, 1913.
- Lamp**, Donald D. Myers, Lafayette, Ind., assignor to the Esterline Company, Indianapolis, Ind. No. 1,074,449. Filed April 21, 1913.
- Self-Closing Funnel**, Karl Heinrich Rosenauer, Frankfurt-on-the-Main, Germany. No. 1,074,465. Filed March 18, 1911.
- Clutch Construction**, Powell Evans, Philadelphia, Penn. No. 1,074,500. Filed May 8, 1912.
- Headlight Control**, Harvey W. Potts, Longmont, Col. No. 1,074,527. Filed March 28, 1913.
- Magneto**, Carl Ebner, Stuttgart, Germany. No. 1,074,542. Filed March 9, 1910.
- Carburetor**, Edgar A. Rlotte, Bronxville, N. Y., assignor to the Standard Motor Construction Company, Jersey City, N. J. No. 1,074,575. Filed Jan. 16, 1912.
- Starting Valve Gear**, Jean Romeyn, Brussels, Belgium. No. 1,073,633. Filed June 17, 1912.
- Internal Combustion Engine**, Paul S. Smith, Newburg, N. Y. No. 1,073,640. Filed April 22, 1909.
- Internal Combustion Engine**, William James Wright, Franklin, Penn., assignor to the Wright Engine Company, Pittsburgh, Penn. No. 1,073,652. Filed March 5, 1912.
- Combustion Engine**, Guido Fornaco, Turin, Italy. No. 1,073,671. Filed Aug. 12, 1911.
- Gasoline Tank**, Leland F. Goodspeed, Milwaukee, Wis., assignor to the Milwaukee Locomotive Manufacturing Company of the same city. No. 1,073,676. Filed Feb. 17, 1912.
- Primary Battery Cell**, Julius H. Gugler and George W. Colles, Milwaukee, Wis., said Colles assignor to said Gugler. No. 1,074,677. Filed June 22, 1910.
- Valve Guiding Tool**, Herman, Bernard and Peter Horn, Washita County, Okla. No. 1,073,686. Filed Dec. 21, 1911.
- Vehicle Wheel**, John F. Mitchell, Topeka, Kan. No. 1,073,697. Filed Sept. 26, 1907.
- Carburetor**, Leonard Atwood, Boston. No. 1,074,727. Filed April 14, 1909.
- Acetylene Gas Generator**, Charles H. Long, Fairbury, Neb. No. 1,073,767. Filed Jan. 15, 1913.
- Internal Combustion Engine**, Luther O. Martin, Parkersburg, W. Va. No. 1,073,770. Filed Jan. 25, 1912.
- Variable Speed Transmission Gearing**, Joseph Michael, Fort Kent, Me. No. 1,073,775. Filed June 14, 1912.
- Front Vehicle Suspension**, Ramon Febres Cordero, Rubio, Venezuela. No. 1,073,796. Filed July 25, 1911.
- Vehicle Spring Equalizer**, George M. Huston, New York City. No. 1,073,804. Filed May 31, 1913.

- Electrically Heated Garment**, Anton Pollak, Paris, France. No. 1,073,926. Filed March 12, 1912.
- Automobile Attachment**, William J. Evans, Linnburg, Ia. No. 1,073,971. Filed Sept. 20, 1912.
- Lever Lock**, Oliver A. Benham, Dayton, O. No. 1,074,038. Filed Dec. 23, 1912.

## COMING EVENTS.

## October.

- Oct. 11—Track races, Springfield, Ill.
- Oct. 12-17—Convention, American Institute of Metals, Chicago, Ill.
- Oct. 12-17—Convention, Carriage Builders' National Association, St. Louis, Mo.
- Oct. 13-18—National fire prevention conference, Philadelphia, Penn.
- Oct. 15-25—Electrical Show, Grand Central Palace, New York.
- Oct. 17-27—Automobile Salon, Grand Palais, France.
- Oct. 18-19—Track races, St. Louis, Mo.
- Oct. 24—Convention, American Iron & Steel Institute, Chicago, Ill.
- Oct. 27-28—Convention, Electric Vehicle Association of America, Chicago, Ill.

## November.

- Nov. 2-3—Road race, El Paso, Tex.-Phoenix, Ariz.
- Nov. 3-8—Motorcycle show, Coliseum, Chicago, Ill.
- Nov. 4-5—Road race, Los Angeles, Cal.-Phoenix, Ariz.
- Nov. 4-5—Road race, San Diego, Cal.-Phoenix, Ariz.
- Nov. 6—Track races, Phoenix, Ariz.
- Nov. 8-12—Track races, Shreveport, La.
- Nov. 7-15—Olympia Show, London, England.
- Nov. 8-15—Show, Atlanta, Ga.
- Nov. 22-29—Show, Providence, R. I.

## December.

- Dec. 1-3—Annual meeting, American Automobile Association, Richmond, Va.
- Dec. 9-12—Convention, American Road Builders' Association, Philadelphia, Penn.
- Dec. 10-12—Convention, Retail Implement & Vehicle Dealers' Association, Milwaukee, Wis.
- Dec. 11-20—International exposition of safety and sanitation, American Museum of Safety, New York City.

## January.

- Jan. 2-10—Importers' Salon, Hotel Astor, New York City.
- Jan. 3-10—Pleasure car show, Grand Central Palace, New York City.
- Jan. 24-31—Show, Rochester, N. Y.
- Jan. 24-31—Pleasure car show, Coliseum, Chicago, Ill.
- Jan. 26-31—Show, Scranton, Penn.
- Jan. 31-Feb. 7—Show, Minneapolis, Minn.

## February.

- Feb. 2-7—Pleasure car show, Buffalo, N. Y.
- Feb. 9-14—Truck show, Buffalo, N. Y.
- Feb. 22-27—Show, Omaha, Neb.
- Feb. 22-March 5—Show, Cincinnati, O.
- Feb. 24-28—Show, First Regiment Armory, Newark, N. J.

## March.

- March 7-14—Pleasure car show, Mechanics' Building, Boston, Mass.
- March 17-21—Truck show, Mechanics' Building, Boston, Mass.

## NEW BOOKS RECEIVED.

**F & S Annular Ball Bearings**, issued by the J. S. Bretz Company, 250 West 54th street, New York City. Illustrated price list of this equipment. Contains a number of useful mechanical tables. Sent free upon request.

**The A. V. Shock Absorber**, issued by Hudson Export & Import Company, 140 West 42nd street, New York City, sole agent for this equipment in America. Illustrates and describes in detail the construction and application of this device. Sent free upon request.

**Cole Blue Book**, published by the Cole Motor Car Company, Indianapolis, Ind., and edited by Homer McKee. It is a handbook and catalogue of the 1914 Cole models, combining a detailed description of the various components and an interesting story of how the standardized car came into being. The work is fully illustrated and forms a valuable encyclopedia of information concerning the product of the company. Sent free upon request.

## RECENTLY ANNOUNCED 1914 MODELS.

**F**OUR entirely new cars are to be found among the list of new models announced below. The brief statements presented include only the more important features or changes in design as made public by the manufacturers:

**Regal**—Regal Motor Car Company, Detroit. Models T, N and NC, underslung, and C, overhung. Underslung bodies, touring car, roadster and coupe on same chassis. Overhung body, touring car. Principal changes include left hand drive, centre control, electric lighting and starting and elimination of side lights. Other changes mainly in refinement of details. Cars listed with full equipment this year.

**Detroit Electric**—Anderson Electric Car Company, Detroit. Models 43, four-passenger brougham with rear seat drive; 44, ladies' open victoria; 45, five-passenger brougham with front seat drive; 46, gentlemen's roadster; 47, four-passenger brougham, and 48, Duplex drive brougham. First three fitted with bevel gear rear axle. Last three have new Daimler-Lanchester imported worm gear. All are equipped with Hanlon patented rain vision window. Full aluminum bodies and fenders, and Detroit Electric shaft drive, chainless power plant continued. Price reductions on all models.

**Crow Elk-Hart**—Crow Motor Car Company, Elkhart, Ind. Three chassis and 10 body designs. Models D42 and D45, roadster and touring, have 35 horsepower motor four-cylinder, L head, cast in pairs. Models D52, D54, D55 and D56, roadster and touring cars, have 40 horsepower motor, four-cylinder, L head, 4.125-inch bore, 5.5-inch stroke, cast en bloc. Models D62, D64 and D66, roadster and touring cars, have 50 horsepower motor, six-cylinder, L head, 3.875-inch bore, five-inch stroke, cast in pairs. Briggs magneto on the small four, Briggs Mag-Lite ignition on the large four, and Deaco ignition, starting and lighting on the six.

**S. & M.**—S. & M. Motor Company, Detroit. New concern. One chassis and four body designs—runabout, five and seven-passenger touring and limousine. Motor, Continental special, six-cylinder, 3.75-inch bore, 5.25-inch stroke, rated at 58 horsepower at 2000 revolutions. Bosch magneto, Timken front and rear axles, wire wheels with Timken hubs, Warner four-speed transmission, Gemmer steering gear, Rayfield carburetor, Mayo radiator, Parish & Bingham frame, Spicer universal joints, Firestone tires, electric starter. Springs, semi-elliptic front, three-quarter elliptic underslung rear. Left hand drive, centre control. Wheelbase, 130 inches. Weight, 3250 pounds. Full equipment.

**Oldsmobile**—Olds Motor Works, Lansing, Mich. Model 54. Five and seven-passenger touring car bodies. Larger motor; 4.25-inch bore and 5.5-inch stroke, instead of 4.125 by 4.75; increased rating from 40.8 to 50 horsepower. Six cylinders, still of L head type, but cast in sets of three. Valve size increased from 1.75 inches to 1.9375. Latest type Delco starting, lighting and ignition system. Cooling by centrifugal pump, instead of gear. Later type of Oldsmobile float feed carburetor. Wheelbase of five-passenger now 132 instead of 135, and of the larger car 139. Tires, 36 by five inches, on Baker straight side demountable rims. External appearance is not greatly changed, except that bodies are hung lower than formerly. Price reduced \$225.

**Monarch**—Monarch Motor Car Company, Detroit. New concern. R. C. Hupp, president. Five-passenger touring car. Motor, four-cylinder, four-cycle, cast in pairs; 3.1875-inch bore, five-inch stroke, rated at 25 horsepower; water-cooled, thermo-syphon; force feed lubrication; float feed carburetor; combined electric starting, lighting and ignition system. Leather faced cone clutch. Selective sliding gear transmission, three speeds forward and reverse. Three point suspension, motor and transmission on tubes. Drive by shaft, not enclosed; double universal joint. Semi-floating rear axle. Semi-elliptic springs forward, full elliptic rear. Pressed steel frame. Wheelbase, 110 inches. Tires, 32 by 3.5 inches. Tor-

pedo type body, stream line, with radiator under sloping hood. Left hand drive, centre control. Equipment includes rain vision windshield, extension top, Jiffy curtains, Jones speedometer, electric horn, etc.

**Flyer**—Thomas Howard Company, sole factory representative, 319 Atlantic avenue, Brooklyn, N. Y. New car. Roadster. Motor, four-cylinder, four-cycle, water-cooled, cast en bloc, 2.75-inch bore, 4.5-inch stroke; barrel type crankcase, three-bearing crankshaft; vacuum feed oiling system, circulating water pump, magneto ignition. Cone clutch, 11 inches diameter, three-inch face, enclosed with flywheel. Transmission, two speeds forward and reverse. Unit power plant. Left hand drive, centre control. Springs, semi-elliptic front, full elliptic rear. Wheelbase, 100 inches. Tires, 28 by three inches, clincher rims. Wire wheels. Equipment includes windshield, two gas headlights, generator, two side oil lamps, rear lamp, tool kit, etc.

**Marmon**—Nordyke & Marmon Company, Indianapolis, Ind. Models 32, four-cylinder, and 48, six-cylinder, continued. New body designs, including three-passenger on six-cylinder chassis. New design of Northeast starting and lighting system, necessitates changes in location. Magneto at the rear of motor instead of front. Zenith carburetor. Addition of single-cylinder motor driven air pump for tire inflation. Clutch on the four is given a wider face and slightly different spring inserts. Brake surface on the six has been enlarged in diameter and the brake adjustment is fitted with a double worm screw design. New type of front hub and steering knuckle on the six, shaped like a bullet and so arranged that the vertical spindle is directly in the centre line of the wheel.

**Howard**—Howard Motor Car Company, Connersville, Ind. New six-cylinder model. Continental motor, specially designed to specifications of Chief Engineer J. C. Moore of Howard company. Exhaust system has two manifolds, two flexible exhaust pipes and two separate mufflers, the idea being that by having successive cylinders in their order of firing exhausting into alternate mufflers the possibility of exhaust gas diluting the incoming charge is effectually obviated. Bore, 4.125 inches; stroke, 5.25. Ignition, Bosch high-tension magneto and Atwater-Kent system. Cone clutch. Three-speed transmission. Timken axles. Springs, semi-elliptic forward, three-quarter elliptic rear. Tires, 36 by 4.5 inches. Left hand drive, centre control. Electric lighting and starting.

**Imperial**—Imperial Automobile Company, Jackson, Mich. Models 32, 33 and 34, all four-cylinders. Model 44 now a six instead of four. An entirely new six with seven-passenger body. Models 32 and 33 on same chassis with new motor, 4.25-inch bore and 5.25-inch stroke, instead of four by 5.5. Cylinders cast en bloc. Model 34 unchanged except for refinements. Model 44 motor has cylinders cast in sets of three, 3.75-inch bore, 5.25-inch stroke. New chassis has motor cast in threes, 4.125-inch bore, 5.25-inch stroke; unit power plant; three point suspension. Multiple disc clutch, Raybestos faced. Three speeds forward and reverse. Full floating rear axle. Springs, semi-elliptic forward, three-quarter elliptic rear. Wheelbase, 137 inches. Tires, 36 by 4.5 inches. Body hung low. Left hand drive, centre control. All models now electrically lighted and started.

Among the interesting exhibits of fire apparatus at the recent convention of fire chiefs at New York City were three pieces of apparatus manufactured by the American-La France Fire Engine Company, Elmira, N. Y. These cars were equipped with the Goodrich wireless tire, made by the B. F. Goodrich Company, Akron, O. The tires are built on a steel base which is inseparably attached to the steel rim of the wheel, wires being eliminated.

## ANNUAL ROAD CONGRESS IN DETROIT.

**A**BOUT 4000 delegates, representing motoring and good roads organizations, attended the third annual road congress, under the auspices of the American Highway Association in Detroit, during the week of Sept. 29-Oct. 4. The sessions were devoted largely to the consideration of improved highway methods and the results which have been obtained in various sections.

David F. Houston, secretary of agriculture, delivered an address in which he stated that the suggestion of great national transcontinental roads appealed to his imagination. He complimented the motorists for the service they have rendered in their propaganda for road building, but held that the construction of such highways was quite as essential for the transportation of farm products to market and to the establishment and operation of decent elementary and secondary schools for the benefit of country boys and girls. He said in part:

There are complex problems to be solved in many states before the most efficient expenditure of money by states and communities for roads can be secured, and there are many more to be worked out before one can rationally expect the federal government largely to participate. Who shall say how aid should be apportioned so that the states may receive equitable treatment? Shall it be apportioned equally among the states on the basis of total population, farm population, area, taxable valuation, road mileage, or all these; and should federal money be expended exclusively through its own agencies for a certain system?

That the suggestion of federal aid to road building raises grave questions and involves possible dangers, no thoughtful citizen doubts. There are proposals before the public mind which would bankrupt the federal treasury and suggest possible abuses before which those of the worst pork-barrel bills of the past would pale into insignificance. No proposal which does not carry with it the assurance of safeguarding the treasury in this direction seems to me to stand the ghost of a chance of favorable consideration.

Secretary Houston suggested as the first practical essential in the planning of road legislation, the recognition of the state as the smallest unit with which the federal government might deal, the initiative to rest with the highway department of the state, the federal agency to reserve the approval of the selection, supervision of the construction and the right of inspection. He also would have some automatic check upon the demands to be made upon Congress, this to be founded upon a number of basic factors, including population, area, wealth, minimum cost of construction, etc.

Col. William D. Sohier, chairman of the Massachusetts state highway commission, gave an extended report of the international road congress recently held in London, and reviewed some of his observances while abroad. He explained

that if his commonwealth were to secure any such road system as that recommended by the international congress, it would require years of work and millions of dollars in money. He estimated it would mean the expenditure of \$5,000,000 and the next 20 years to complete the main trunk and secondary highways alone.

Congressman D. W. Shackleford, chairman of the House committee of roads, stated that he was "not in harmony with the dominant spirit" of the convention. He urged support for the "business roads" class, which, he said, aimed for cheaper transportation and lower cost of living, rather than the "touring roads" class, which, he held, demanded that the federal government devote its energies to the construction and maintenance of a few ocean-to-ocean and cross country highways and then leave the rest of the people to look out for themselves. He said in part:

You gentlemen are seeking to promote the construction and maintenance of a limited mileage of excellent highways, while I am seeking to secure the construction and maintenance of a general system of good roads. You want 50,000 miles of expensive touring roads to be built in 40 years. I want a million miles of business roads and post roads to be built in five years. I appeal to you to withdraw your opposition to a plain people's plan, which we desire to pass through Congress at the next session. Our plan will not be expensive and a vast majority of the people favor it.

In the last Congress we passed through the House a bill providing a yearly contribution to each mile of roads in the states which should be constructed and maintained according to specified standards. The bill failed in the Senate. I am informed that the American Automobile Association claims the credit for its defeat. But, had that bill become a law, it is my candid opinion that within one year it would have given us 50,000 miles of improved roads and in five years would have given us a million.

Practically every plan for securing improved highways was given consideration by the conference. It was noticeable that the propositions, including the use of federal money in road construction, were given much greater attention than ever before in a convention of this character.

## STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC.

Of The Automobile Journal Published Semi-Monthly at Pawtucket, Rhode Island, required by the act of August 24, 1912.

NOTE—This statement is to be made in duplicate, both copies to be delivered by the publisher to the postmaster, who will send one copy to the Third Assistant Postmaster General (Division of Classification), Washington, D. C., and retain the other in the files of the postoffice.

## LONG DISTANCE ELECTRIC TOUR.

### Bailey Car with Edison Battery Covers 258 Miles Without Difficulty.

In connection with the convention of the New England Section, National Electric Light Association, in Burlington, Vt., last month, E. W. W. Bailey, general manager of S. R. Bailey & Co., Amesbury, Mass., drove a Bailey electric, fitted with Edison battery, made by the Edison Storage Battery Company, Orange, N. J., from Boston to Burlington, a distance of 258 miles. The trip was undertaken to try the performance and availability of this type of car and the Edison battery through supposedly difficult country and over a route never before attempted by an electric, and, being successful, to demonstrate to the convention and the residents of the district traversed that the era of the electric roadster has arrived.

The itinerary led from Boston to Fitchburg; through Ashby, Jaffrey, Dublin and Marlborough to Keene, N. H.; thence, in the evening, through Walpole and Bellows Falls into Springfield, Vt. The next morning the trip was resumed through Rutland, Brandon, Middlebury, New Haven and Vergennes to Burlington. The average speed for the whole distance was exactly 19 miles an hour. The slowest run, from Keene to Springfield, 42 miles, was covered at 16.7 miles an hour, and this was made almost entirely after dark. The hardest part of the route was from Springfield to Rutland, this being fairly mountainous, with repeated descents to valleys and through several places where road repairs were under way and could not be avoided.

The car was a model E Bailey roadster, equipped with 60 cells, Edison battery of the new A-5 size. It was not a special car, but was taken from service after having been 10,700 miles during the last 11 months. No adjustments or repairs of any kind were required or made on the way. No attempt was made to run the machine an extreme distance on one charge, such not being good touring practise and not necessary. The car was given a full, normal charge before leaving Boston, and no other full charge was given the battery en route. Partial charges were taken at Fitchburg, Keene, Springfield, Rutland and Middlebury, at rates varying from 30 to 150 amperes. The normal charging rate of the battery is 37.5 amperes.

The Knox Automobile Company, Springfield, Mass., reports that the business for August increased 100 per cent. over the same month in 1912.

## Get the New Stutz Series "E" Catalog—Now Ready

### See the Sturdy Stutz Before You Decide

All we ask is, that before you select your next motor car, you compare the Stutz, part by part, with any car at any price—then you, too, will decide in favor of the Sturdy Stutz.

### New Models Even Better Than Previous Stutz Cars

In the new Series "E" Stutz, no radical mechanical changes have been made—they were not necessary. Just a few details have been altered, insuring even greater service and power, with a few touches that add to the graceful beauty lines for which all Stutz models have been famous.

The bodies of the Touring Cars are larger, roomier and even more comfortable than ever before. The upholstery is more generous, the springs are a little longer—the same perfection mechanically has been maintained.

The Electric Starting, Lighting and Ignition systems are **separate units**; simple, dependable and easy to operate. So, before you decide, write for our new illustrated catalog No. A-5, Series "E." We will put you in touch with your nearest Stutz dealer.

**We still have some desirable territory open and will make a satisfactory contract with responsible dealers—write us.**

# The "Black Eagle" Spark Plug

PATENTED

## 50 Cents Is Enough

The "Black Eagle" Spark Plug has made good because it was designed and manufactured with this result in view.

A person in close touch with the supply and manufacturing ends of the trade was a visitor at our factory recently, and was shown the details of construction, including the machinery, testing, and assembling of the "BLACK EAGLE" Spark Plug. What he said we believe will be of interest to you, as it indicates the effort on our part to supply a high grade plug at a reasonable price. We therefore quote below his impressions.

"I am simply amazed at the workmanship, material, and construction of the 'BLACK EAGLE' Spark Plug. When I saw this plug advertised at a price of 50c to the consumer, I naturally supposed it was a cheap, common, plug such as you occasionally find in jobbing houses on the bargain counter. I am convinced, after seeing these plugs tested, and examining minutely the machine parts which enter into their construction, that no better porcelain spark plug is offered by any one, regardless of the price they ask."

We are not influenced by what our competitors charge for spark plugs! We have ignored price precedent, for the reason that a high grade spark plug can be manufactured and sold at 50c each, and that is enough.

Sent prepaid on receipt of price. Made in all standard threads.

## Let Your Motor Do The Work

The Pump that took the "Shun" out of Inflation.

It's a pleasure to inflate your tires without sweating, fuming and straining.

It's an economy to get the exact pressure you need to make your tires give maximum service.

It's a convenience to attach and detach your pump without a wrench. A twist of the wrist and a few seconds of time to attach the pump, one to four minutes with your motor at low speed to get the right pressure. The gauge tells you when to stop.

**THE BROWN IMPULSE TIRE PUMP for 1913** is the **only** tire pump that attaches and detaches without a wrench; the **only** one that includes hose, self-opening valve connection, high grade recording gauge and Quick Detachable Spark Plug as part of its regular equipment. Your 1913 equipment is not complete without it. It sells for \$15.00. Ask your dealer today. If he can't tell you all about it, send to us for descriptive literature.

## EMCO Automobile Oil is thoroughly genuine

EMCO is the one Automobile Oil that is thoroughly genuine. It is so far superior in every respect that comparison is impossible.

Emco is strictly a mineral oil, refined right in the heart of the Pennsylvania Crude Oil fields. It is absolutely free from all carbon, acid, animal or vegetable ingredients, which makes it wonderfully consistent and remarkably economical. It lasts nearly twice as long as most oils.

Furthermore Emco Automobile Oil is sold under the following guarantee of satisfaction:

### GUARANTEE

If Emco Oil does not prove satisfactory to YOU in absolutely every respect, we will refund your money in FULL—pay freight (both ways if oil is returned) and make no charge for oil used in trial.

If your dealer cannot supply you, we will ship Emco direct to you in five or ten gallon cans, barrels or half barrels.

## J. M. Shock Absorber

Wherever you see  
fine automobiles—in  
America or abroad—  
look at the rear springs!

The overwhelming preference of discriminating automobilists for

## J. M. SHOCK ABSORBERS

You can see with your own eyes this conclusive evidence that no automobilist looking for comfort and economy of operation should overlook the J. M. Shock Absorber.

If you want further proof—send for the Ovington Data Chart "D." It tells in simple, graphic lines drawn by the car itself, the remarkable efficiency of J. M. Shock Absorbers on roads of all types, from the rough country lane to the finest boulevard.

Here is real proof—not mere claims.

It is yours for the asking.

The limited edition of these charts is rapidly being exhausted.

Write for your copy at once.

## The J. M. Shock Absorber Co.

(Incorporated)

210 S. 17th Street, Philadelphia

## The Grip That Doesn't Slip

is the grip J-M Non-Burn Brake Lining takes when brakes equipped with it are applied. It stops a car almost instantly in emergencies—gradually when desired.

Made of Asbestos interwoven with strong brass wires,

## J-M NON-BURN BRAKE LINING

insures quick and positive action of brakes and gives you safe and sure control of car. Frictional heat, water, grease or gasoline cannot injure this lining or impair its gripping power. Outwears twelve ordinary linings.

Name stamped on every piece. Sold by most dealers.

**WHICH ROAD—**The highway at a trifling toll or the by-way with its deadly risks?

**You're not the man to hesitate!**

Nor can you debate long in choosing lubricants when the same fear, the same certainty of wear and tear attend the use of greases which save (?) a few nickels when you buy.

YOU can afford to use

TRADE MARK  
**NON-FLUID OIL**  
REGISTERED IN  
PATENT OFFICE  
UNITED STATES

at a little higher price per can when you secure the smooth, open road to long life for your car and the satisfaction of mindease about your bearings.

Silent gears, a smooth flow of power from engine to wheels, long service from the costly ball and roller bearings, cool, uncomplaining universal joints and differential—these are the NON-FLUID OIL delights, at perhaps a yearly comfort toll of one dollar—surely at a yearly saving of \$50 to \$100 in bearings and repairs.

**You're not the man to hesitate!**

Be sure you get genuine NON-FLUID OIL, packed in orange colored cans bearing the above Trade Mark.

## You'll Make No Mistake

if you say Colonial—and insist on  
having it—because it's an oil that  
can be depended upon, made by a  
firm with a reputation of over thirty  
years' standing  
for high-class  
products.

Use COLONIAL and  
NOTE the DIFFERENCE

## COLO GREASE

*A real transmission grease*  
Will make your gears run  
smoothly and quietly be-  
cause it is made especially  
for gear lubrication.

## COLONIAL

## Timing Gear Oil

overcomes all trouble with  
your timing gear. Use it  
and NOTE the DIFFER-  
ENCE.

## SILEX GREASE

*The greasiest grease made*  
The real test of a grease is  
not its looks or the feeling  
but its lubricating prop-  
erties. SILEX is made to  
lubricate and last.

# WARNER

## QUALITY AUTO-METER

### Providing Surplus Speed Capacity

**E**VERY part of every Warner Auto-Meter made must be proven absolutely correct in the most severe speed tests before our expert inspectors pass it for final assembly and shipment.

The specially constructed testing machine shown above is designed for thoroughly trying out every part of the instrument. Sixty miles an hour is excessive motor car speed. This test is made at the rate of 150 miles per hour. Therefore every Warner has a surplus speed capacity of

250 per cent., in which it has been proven correct.

Absolute accuracy and precision are the qualifications demanded in the test. Speed indicating dials or mileage odometers that show even one-tenth of a mile error are discarded. The swivel joint must work perfectly. The flexible shaft must deliver a constant, even pull. The slightest indication of wear in any part sends the whole instrument to the scrap heap.

No other speedometer on the market is so carefully constructed or subjected to such expensive and scientific tests as the Warner Auto-Meter.

*Service Stations in all important cities all over the world*

## HAVOLINE OIL

For Perfect  
Lubrication of  
Automobile

And Marine  
Gasoline Engines

This OIL is NOT AN EXPERIMENT, here today and gone tomorrow, but has for many years maintained the highest reputation as a scientifically prepared lubricant which is properly filtered, so that it burns clean, without leaving carbon deposits on plugs or cylinders.

The biggest engine manufacturers in the East and in the West recommend it; thousands use it on Touring and Racing Automobiles, and Working, Cruising and Racing Motor Boats, and all are pleased to find that

# The Miller Automobile Jack

The MILLER AUTOMOBILE JACK is a single acting, automatic-lowering jack, designed especially for automobile use and is adapted to the factory or garage as well as to be carried as a part of the equipment on motor cars. The MILLER JACK is constructed of the best material, no complicated or loose fitting parts to get out of order, and in material, workmanship and finish, the MILLER JACK is not exceeded, if indeed, it is equalled by any other jack. It is a high grade and one of the finest finished jacks on the market.

The short stroke makes lifting easy and rapid. Automatically locks while operating, thereby doing away with any possibility of slipping or dropping the load.

Fitted with a simple and convenient trip lever for reversing. Height, 11 inches. Raises 6 inches. Weight, 9 lbs. Capacity, 1 ton.

We guarantee this jack for 12 months, and at the price, it is the best value ever offered to the automobile trade.

We are in a position to quote a special price to manufacturers, jobbers and dealers who buy in quantities.

**CAPACITY: ONE TON.**

The List Price of the MILLER JACK,  
guaranteed for twelve months.....\$3.00 each

Weight, packed for Parcel Post, 10 lbs.

**AGENTS WANTED. ADDRESS JACK DEPARTMENT.**

**THE MILLER JACK**  
Designed for any size and style of automobile and is adapted for all purposes.

**TUBE BAG**

**25c A REAL INNER TUBE BAG FOR 25c**

**MAILED TO ANYONE IN ANY PART OF THE UNITED STATES  
MADE OF HEAVY NAPPED CLOTH**

Will keep your inner tube free from grit and dirt, and from scratching or chafing while in the tool box or luggage carrier. Answers the same purpose as tube bags which cost \$1.50 or more. Will hold one tube 5 inches or smaller. Protect your tubes and reduce your tire expense. In ordering, state size of tube.

Send 25c. in stamps or coin, and tube bag will be sent to you by return mail

Send your name and address NOW with 4 cents postage (to cover cost of mailing) for a free copy of our Big 256 Page Catalog

## No Other "Six" in the World Near this Price

The new Studebaker "Six" stands absolutely alone and apart in the entire field of six-cylinder cars.

At its price of \$1575—less by hundreds than any other "Six," it confers the operative advantages of the "SIX" emphasized and enhanced because this "SIX" is a Studebaker-manufactured "SIX."

It affords passenger capacity for seven.

It brings the manifest advantages of electric lighting and starting through a two-unit system that has proved itself on thousands of Studebaker cars.

Never before has such a car been offered at \$1575.

Today there is not such another car, at this price, in the entire world.

### Six Thousand Manufacturing Operations

How completely the Studebaker "SIX" is the product of the great Studebaker plants you will realize when you know that its construction requires more than 6000 manufacturing operations.

Throughout the rear axle and transmission, and in the front wheels we use 13 Timken roller bearings for quiet, easy running.

In fuel consumption we believe the "SIX" will match, if not surpass, the economy of any car of equal horsepower. Its motor size is  $3\frac{1}{2} \times 5$  inches.

It is economical because, in spite of its 121-inch wheelbase it is light, and easy on its 34x4-inch tires; yet it is wonderfully strong.

### Carries Seven in Comfort

It is generously roomy and richly upholstered, and carries its seven passengers in utmost comfort.

In design and lines, the "SIX" acknowledges no greater beauty and grace.

The starting and lighting system is the Wagner two-unit, starting motor and generator separate.

Lamps are Gray & Davis' highest quality, parabolic type.

In short, the "SIX" lacks nothing in style, beauty or comfort.

Electrically Started  
Electrically Lighted  
Seven-Passenger

## A "Six" That Has a Field All To Itself

The superb new Studebaker "SIX" is a **manufactured** "Six" down to the smallest essential detail.

Any other kind of a "Six" we decline to consider in comparison.

In a "Six" you must have manufactured accuracy—every "Six" part must synchronize with every other part.

And—even so—there is no other "Six" either assembled or manufactured, which is even near the Studebaker "Six" in price.

**STUDEBAKER,**

**Detroit, Mich.**

# \$1575

## Try to Find Another "Four" Like This

We hold fast to our positive convictions concerning this new Studebaker "Four."

We are convinced, to begin with, that you will not find another "four" which compares with it in value.

We are convinced that it will eventually compel those above it in price to give more; and those below it, to charge less.

We believe it will cause more changes in ownership among those who have waited for a higher quality to be brought down to this price than any "four" which has preceded it.

STUDEBAKER,

Detroit, Mich.

**\$1050**

### *This "Four" the Final Word Among Four- Cylinder Cars*

This Studebaker "FOUR" has been developed from our experience in building 110,000 "FOURS".

Its price, \$1050, represents the outside limit of price for a "Four", because no "Four" can give more, in actual value or performance, than this one does.

So its price is right. Its capacity is right. Its power is right. It is the right type—the last word among four-cylinder cars.

### **Thirteen Timken Bearings**

Nothing that we can say here will give you an adequate idea of the power possibilities of this car—or of the things of which it is actually capable.

The long-stroke motor presents the latest approved engineering practise—cylinders cast en bloc, valves enclosed, exhaust and intake manifolds integral.

Thirteen Timken bearings reduce friction and wear to the minimum at every point in the transmission and rear axle and in front wheel hubs.

Its rear axle is of the full-floating type, and completely accessible.

The rear springs are full elliptic, very long and easy, and with the lower member suspended beneath the axle.

### **Electric Lighting and Starting**

It has left hand steering and central control.

The electrical starting and lighting equipment is the Wagner two-unit system—

Headlights are Gray & Davis' best quality parabolic lamps.

The windshield is of new design, ventilating, clear vision and rain vision.

Rims are detachable demountable, with one extra rim and tire carriers at the rear.

Electric horn, robe rail and tool box are also furnished with the "four".

COES

## THE Wrench Supreme

Strength without bulk or clumsiness.

Ease of handling without slipping or bruising.

Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

# You Must Not Contract—Yet

**A**N intensely interesting story of the season's "one best bet" will soon be told, and it will reverberate from the Atlantic to the Pacific—from the Great Lakes to the Gulf of Mexico—and back again.

Startling as the development of the motor car has been and regardless of the statements that nothing new can be offered in motordom, we must, from necessity, say: "We told you so!" if you do not wait for our announcement about November first.

Wait—don't make us say: "We told you so!"

*Wait!*

**Moline Automobile Company**  
East Moline, Illinois

## PUBLISHER'S COMMENT.

**The Automobile Journal Is an Owner's Magazine.** More practical information for owners is published in each issue than in all other motoring prints combined. The man who is operating his first car needs expert advice, presented in such terms as to be readily understood and applied. Special attention is directed to a new department in this issue—see pages 42-43-44—and if your particular trouble is not outlined therein, you are invited to make free use of the Correspondence Department on pages 59-60-61.

**Automobile Owners Cannot Afford** to miss the Annual Overhaul and Equipment Number of The Automobile Journal, issue of Nov. 25. Not only will it treat exhaustively with respect to the actual work of overhauling the chassis for winter driving, but it will present every new feature in the list of accessories, supplies and fittings, designed for comfort and convenience, safety and economy in operating the car during the cold weather. You will need this number—the most practical working guide and complete reference book of the season. Order direct, or through your news dealer. No advance in price.

**Keep Well Posted Concerning** the new accessories, supplies and fittings, by watching carefully the section devoted entirely to these on pages 36-37-38. And don't forget to consult the Buyers' Reference and Guide, beginning on page 87, when contemplating purchases of any nature.

# Prest-O-Lite

"The reliable light"

**The Real Facts on Lighting**

with all the guesswork eliminated.  
If you really want to KNOW which is the most reliable, the most economical, and the **most convenient** light—Send for this book!  
It does not merely claim that Prest-O-Lite is the light you want—it **PROVES** it.  
If you read nothing else but the letters from owners who have had their experience with electric lighting systems, it will more than repay you for getting the book.  
With these facts at your disposal you can get greater value in any car you buy.  
If you do not know why electric light costs at least five times as much as Prest-O-Lite, read this book and find out what experience has actually proved among automobile owners, electricians and electrical engineers. These articles are not written to confuse you. On the other hand, they make the whole subject clear as daylight—easy to read and easy to understand.  
This book does not theorize. It is a report of **PLAIN FACTS**.

**Power and Fuel Consumed by Electric Lighting Apparatus**

An Analysis of Electric Light and Prest-O-Lite

- Why electric equipment cripples the engine
- Why Electric Light costs far more than Prest-O-Lite
- What electricians say
- Comparative reliability
- Comparative convenience
- Quality of light
- Why automobile manufacturers use Electric Light
- Self-starters
- Letters From Owners Who Have Discarded Electric Lights

**Don't Delay!**

Already the first two hundred thousand edition is practically exhausted. The demand is exceeding every expectation. This fact, backed by the proof of the great, new Prest-O-Lite factory, with output increased four times and working to its full capacity, is an indication that the motorist appreciates reliable light. If you want to get the real truth about automobile lighting—use the coupon.

## FUR VERY POPULAR FOR MOTORING WEAR.

**Designers of Women's Coats Have Been Most Generous in Its Use for the Coming Season--Weather Resisting Mackinaw Shares Favor Among the Men.**

**S**IMPLE and attractive lines mark the offerings in women's motoring apparel for the fall and winter season. For the most part plain colors predominate, and it may be added that the softer tones are much favored. This applies to coats designed for general automobile wear, for there is a wide difference between the garments which are regarded more suitable for limousines and other enclosed cars and those which are intended to protect the wearer from the exposure incident to riding in the touring car or roadster.

The sport coat, which came into favor among motorists last spring, appears to have had its influence upon the winter models, at least, insofar as the length is concerned. The three-quarter coat is quite the rule, particularly for town wear, and it must be admitted that very little long distance riding is undertaken during the winter months. In general, it may be conceded that the garments are roomy, this being

true especially of the back. The tendency toward the belted in model is by no means as strong as earlier in the year.

This is held to be a fur year. Of course, furs always are suitable for motoring wear, and the woman who has occasion to take even infrequent long distance trips feels that she must have a garment, either made of or lined with this material. But this season it is to be noted that even on suits for street wear and sometimes on dresses for indoor occasions, fur trimmings appear in one form or another. This is what is meant by a fur year, and it is utilized rather freely in trimming some of the lighter weight coats for motorists.

A number of distinctive coats for women are presented herewith, the selection covering a wide range, both in material and design. The first model shown is of the new sport length, caracal fur with collar and fancy tab of ermine. Crocheted buttons

**Patrick-Duluth Mackinaw Automobile Robe, Possessing Wind and Weather Resisting Properties.**

**Caracal Fur, Hudson Seal and Worumbo Chinchilla Coats.**

help to carry out the general effect. The lining is of fancy brocaded satin. Worn with this coat is a black velvet hat trimmed with a white ostrich plume, the small bunch of gold grapes on the side serving to relieve the contrasting black and white.

The second model is a three-quarter coat of Hudson seal, with large buttons of the same material. The collar has the deep roll, which is one of the season's features, and it and the deep cuffs are of genuine civet cat fur. This coat also has a brocaded satin lining, and the entire effect is one of warmth and comfort. The hat is a black velvet tam model, edged with the civet cat fur.

The third coat is of Worumbo chinchilla, the significance of the "fur season" again being demonstrated in the small round collar of civet cat.

**Plush Chinchilla, Hudson Seal and Plush Lined Duvetyn.**

The buttons are of ivory, fastened with loops of self material, and the belt, also of self material, finished with buttons, relieves the plain side lines. The hat in this instance also is of black velvet, trimmed with a maltese bow and a rose.

The tendency toward soft tones is well represented in the imported plush chinchilla model seen at the left of the next group. The coat may be worn open at the throat as shown, or turned up closely about the neck. The collar is of the long roll panel design, and the coat is fastened in front with a handsome frog of soutache braid and self material. Deep cuffs add still another touch of warmth. The model is lined throughout with brocaded satin. With this is worn a plain beaver hat.

In the centre of this group is another three-quarter cutaway coat of plain Hudson seal, lined

**Imported Bolivia Cloth, Silk Zibeline and Two-Ton Boucle.**

with brocaded satin. This also has the large roll collar and deep cuffs. The hat is of velvet with a lace rim and presents the new halter about the throat, the plain color being relieved at the side by a pink rose.

The coat at the right is of wool duvetyn, lined throughout with leopard plush, which forms a lapel effect when worn open as shown. The fur appears again in the mink collar and along the top of the cuff. The back is gathered in and held in place with mink trimming. The hat is of velvet, mink faced, and trimmed with a Panone feather.

One of the long coats is shown at the left of the third group. This is of imported Bolivia cloth, with collar and cuffs trimmed with chiffon broadcloth. Buttons are utilized somewhat more freely than with the other models described,

and the buttonholes are piped with the broadcloth. The design is with the so-called paddock effect, and it may be added that the collar may be worn buttoned closely about the neck. The plain tailored silk beaver hat is trimmed with an uncurled ostrich plume.

The coat in the centre is of silk zibeline, with very deep set in sleeves, and the new convertible collar. The fur trimming appears once more in the two-tone boucle coat at the right, this being with opossum collar and cuffs. The sleeves are of the large set in type. A deep fold of self material fastened with large buttons appears at the back. The hat in this instance is of velvet trimmed with silk ribbon and buckle.

Another full length coat is shown at the left of the next group, this being of checked tweed material with the boucle effect. The collar is of moire boucle and the loose set in sleeve termin-

**Short Mackinaw, Browning, King Special and Raglan.**

The deep cuffs and Robespierre collar are of the same material. The coat fastens at the front with a large frog. The hat is a small velvet toque, with a large moire bow fastened with a bead ornament.

The coat in the centre is of raccoon, and conveys a decided impression of warm and long distance touring comfort even in the coldest weather. It has the large roll collar and deep cuffs, and the double-breasted front is fastened with large bone buttons. The hat is a tricorne trimmed with gilt braid.

The last coat presented is of boucle, with brocaded collar and cuffs. A broad seam down either side carries a large number of small buttons, while the front and back are somewhat plain in contrast. The sleeve also is finished with a button. The hat is of black velvet, trimmed with a moire band and a Neumandy tip.

Winter motoring coats for men are designed to present the utmost of comfort and conven-

**Blended Raccoon, Chinchilla and Mackinaw Models.**

ates with a large fancy cuff, trimmed with buttons. Velvet buttons also set off the belt effect at the side and serve to relieve the color scheme.

The shorter coat in the centre is of silk plush with opossum collar in the Robespierre effect. It fastens in front with a long braided silk cord and buttons of self material. The new cutaway effect is noted at the bottom. The lining is of brocaded silk.

Still another long coat is seen at the right, this being of silk camel's hair, with plush and seal trimming. The wide belt at the front and sides is fastened with three large celluloid buttons, which appear again in the back and on the cuffs. The hat is of silk velour, trimmed with opossum and a quill feather.

At the left of the last group is shown a black and white zibeline coat in imitation civet cat.

**Balmain, Scotch Material and Double-Breasted Coats.**

ience. There is a wide range of materials, both in the cloth garments and those in which fur plays an important part. Perhaps the mackinaws

Checked Tweed, Silk Plush and Silk Camel's Hair.

are even more popular than ever, and it may be contended that their popularity is due in no small measure to the quality of the material to resist wind and weather to a remarkable degree. A brief description of the several models shown herewith will serve to indicate the many desirable features among the season's offerings.

At the left of the first group illustrated is a coat of blended raccoon with the shawl collar and deep cuffs, which add materially to the comfort of the wearer when the winds are the sharpest. These cuffs, as, indeed, is true of nearly all the models illustrated, are fitted with the new type of windshield about the wrists, effectually preventing the entrance of cold. The cap is known as the Detroit, a fitting name for an automobile hat, and is of the same material as the coat. The visor and sides pull down, completely protecting the head. The gloves are of buckskin with otter back.

In the centre is a chinchilla automobile coat, also with the shawl collar, which in this instance is buttoned closely about the neck. Large patch pockets and a half-belt in the back serve to relieve the otherwise plain appearance. The cap is an imported Rodol, and is somewhat reminiscent of the head dress worn by aviators. It may be worn with visor and sides folded, but as shown the cape sides are pulled completely around the head, leaving space only for breathing, and the eyes. The latter may be protected still further by lowering the visor.

At the right is a Patrick-Duluth mackinaw, made of the best, long fibre, northern wool, so treated that it is held to resist the effects of rain or snow, even after long exposure. It should not be understood that this means a water proof garment, in the sense that the wearer is absolutely protected from the effects of the weather, but continued use has indicated that the rain resisting qualities are such as to afford protection to a decided degree. This coat is a full length model, with convertible collar and belt effect at the waist, and the cap is of material to match.

Another mackinaw model, by the same maker, is shown at the left of the second group. This is a double-breasted short coat, with the same convertible collar and belt, and might be regarded by some as more suitable for chauffeurs for town use, or for motorcyclists. The cap is of the same material, and has the new inside band, which pulls down over the ears. The leggins are of an imported Spanish design, termed the Toreador, and said to be a style much worn in Cuba and in South America, and one which is proving decidedly popular in America this season.

The coat in the centre is the Browning, King special, and has been designed to meet the desires of those who are seeking something distinctive. It is made of heavy weight material and lined throughout. Knife pleats down the front, sewed down pleats three-quarter way down the back and double-pleated patch pockets serve to break up the plain lines as completely as might

Imitation Clvet Cat, Raccoon and Boucle Models.

be wished, but there are other pleats about the garment, notably the inverted pleats in the skirt.

In sharp contrast to this is the raglan at the

right. It is just a plain raglan, with single-breasted, buttoned through front and convertible collar, but the popularity of these garments is sufficient

**Muskrat Lined Kersey, Belted Back and Russian Dog.**

to permit a wide selection in materials.

Another plain design is seen in the Balmacan automobile coat at the left of the third group. This has the brush collar, the so-called kimono sleeve and the loose fitting back and bell skirt, which cannot help but suggest comfort. The coat in the centre is a single-breasted model of heavy Scotch material, with convertible collar, patch pockets and the half-belt at the back. That at the right is very similar in design, except that it is double-breasted instead of single, and comes in the plain colors.

In the next group are to be seen, from left to right: A muskrat lined kersey model with Persian collar, and cap of seal; a double-breasted cloth coat with patch pockets and belted back, and a wool lined genuine black Russian dog skin with cap to match. The last group presents the following: Wool lined marmot, with shawl collar and deep cuffs; wool lined Russian dog, with raccoon collar, and Worumbo chinchilla coat lined with plaid woolen.

On the opening page of this article is presented one of the Patrick-Duluth mackinaw robes for automobile use. What has been written regarding this material with respect to the coats applies with equal force to the robe. Light in weight and easily handled, its ability to resist cold and dampness makes it a valuable accessory for winter driving. In appearance, it is quite in keeping with all the appointments of a high grade car.

The Automobile Journal is indebted to Cherry & Webb, Providence, R. I., for the illustrations of women's wear shown herewith, and to Brown-

ing, King & Co., New York City, with branches in Chicago, St. Louis, Milwaukee, Cleveland, Cincinnati, Buffalo, Boston, Philadelphia, Providence, Kansas City, St. Paul, Minneapolis and Omaha, for those in which the men appear.

### TO PRODUCE WARREN CARS.

#### New Warren Motor Car Company to Be Organized for This Purpose.

According to information from Detroit, a new Warren Motor Car Company, a close corporation, will be organized to continue the production of Warren cars. A. D. Dunk, president of the Auto Parts Company, is said to be at the head of the new concern, which has purchased the stock of the old Warren company from the Rands Manufacturing Company, which bought it at the recent receiver's sale.

It is stated that the policy of the new company will be to continue the models along the same lines as before, but there will be fewer of them. This is taken to mean there will be but one four-cylinder chassis and one six. It is expected that contracts will be placed with agents this fall, although it is not anticipated that the output for 1914 will be as large as would have been the case had the old company remained a going concern.

The educational department of the Y. M. C. A. at Cleveland, O., has started an automobile class which is very practical in its scope. The course

**Marmot, Russian Dog and Worumbo Chinchilla Cloth.**

includes actual shop practise and individual road work, while written tests on shop and road work are also conducted.

### THE PARTIN-PALMER MODEL.

#### Held to Present a New Standard for Popular Priced Automobiles.

The Partin-Palmer "38", full details of which were presented in The Automobile Journal for Aug. 25, is held to set a new standard for popular priced cars, and to be the first automobile ever built of six-passenger capacity, with 115-inch wheelbase and 38 horsepower motor, to sell at less than \$1000. This is claimed to be possible on account of the complete standardization of parts and the small expense involved where a new company with no big overhead brings the parts together.

The credit for the designing and production of this machine is due to R. A. Palmer, who was the designer of the Cartercar and was general

enced by a new model. Mr. Crawford was accompanied on the trip by H. C Bradfield, field advertising manager; Lew Pettijohn, chief tester, and the Cole cub, a little black bear, which was picked up somewhere out on the Pacific Coast.

The party, minus the bear, left Indianapolis early in July, a few days after the departure of the members of the Indiana Automobile Manufacturers' Association, which took part in the Indiana-Pacific tour. The car arrived in San Francisco a few hours after the arrival of those tourists. Subsequently, the entire machine was dismantled and the result of the inspection was made public.

Then began a journey northward along the coast into Oregon, Washington and British Columbia. The return trip was made over the northern transcontinental route, conceded to be one of the most difficult sections of the country for automobiles. All told, the party entered 15 states, besides the Canadian points visited.

A large number of Cole owners formed a parade to act as escort for the test car upon its return to Indianapolis, and the photograph reproduced herewith was taken directly after the meeting on the road. The test car is shown in the foreground. Mr. Crawford is at the wheel. Beside him is Joseph Cole, son of President J. J. Cole, who has just been presented with the bear cub. Mr. Bradfield is in the tonneau and

Indianapolis Cole Owners Forming Escort Party to Welcome Home the Six-Cylinder Test Car.

manager of the Cartercar Company for a time. The sales are under the management of C. C. Darnall, general sales manager for the Partin Manufacturing Company, Detroit, and a man of long and successful experience in the automobile industry. The offices of the company are at 29 South La Salle street, Chicago.

### TEST TRIP IS ENDED.

#### Chief Engineer Crawford Returns to Indianapolis with Cole Six.

Having covered 8800 miles during the last three months, Chief Engineer Charles S. Crawford of the Cole Motor Car Company, Indianapolis, Ind., has returned to that city with the 1914 six-cylinder Cole car, which has been given one of the most severe road tests ever experi-

Mr. Pettijohn has one foot on the running board.

The Cole company will again completely dismantle the car, examining every component for wear, etc., and will publish the results of this inspection in book form. In addition, the volume will contain data concerning transcontinental touring from the automobile engineer's viewpoint. It will be distributed among all motor car owners who make application therefor. Incidentally, it may be added that the current number of the Cole Bulletin contains an interesting illustrated story concerning the trip.

The Bosch Magneto Company, New York City, learns that the six-cylinder Sunbeam car, which recently created new world's records from 200 to 1000 miles and from two to 12 hours on the Brooklands track, Weybridge, England, was fitted with Bosch ignition.

# THE COOLING SYSTEM IN COLD WEATHER.

## Suggestions for Preparing Its Components for the Use of Anti-Freezing Solutions, Value of the Mixtures, and How They Are Maintained.

**W**ATER is defined as a colorless, tasteless fluid, which is practically incompressible, boils at 212 degrees Fahrenheit, and freezes at 32 degrees Fahrenheit. Its expansion in passing to a solid state is about 8.55 per cent. The last sentence is of vital interest to the motorist whose motor is of the water-cooled type and who has not made provision to guard against the resultant damage of freezing temperatures.

While the expansion above referred to may appear small, it may be termed irresistible insofar as the components of the cooling system are concerned and the solidifying of the contents of the cooler, water jackets and piping system, will burst these members as easily as if they were constructed of egg shells.

The experienced motorist usually prepares for

at a slight cost, and a burst radiator and cracked cylinders are very expensive, it is obvious that it is economy to be on the safe side.

Before discussing the various ingredients employed, suggestions for preparing the radiator, etc., will be of value, for the use of some forms of anti-freezing solutions requires that the cooling system be perfectly tight.

### Cleaning the Radiator.

After the car has been in service for several months, and especially where the water has not been changed, it is recommended that the old fluid be removed and the components thoroughly cleaned. While the water may not indicate the presence of scale, etc., in the radiator, the use of a cleansing preparation generally shows the presence of foreign elements. Chemical prepara-

cold weather and accompanying freezing temperatures by utilizing an anti-freezing solution, of which there are several, but the new automobilist, who purchased his machine in the spring, and who has forgotten the paragraph incorporated in the instruction book dealing with cold weather, needs reminding of the importance of observing the recommendations offered by the car manufacturer.

Freezing temperatures have been recorded in October and those who store their machines in unheated garages or make week-end trips to the country, will do well to either drain the water from the cooling system or utilize a solution having a freezing point well below 32 degrees Fahrenheit, depending upon locality, etc. As an effective solution may be prepared or purchased

tions may be purchased or a simple solution of common washing soda may be prepared. The latter mixture is made by dissolving as many crystals as the fluid will absorb, using five gallons of water, for example, if the cooling system employs this amount. If, on draining off the old contents the water is badly discolored, it is advisable to operate motor for some little time with soda solution. After its use the system should be thoroughly flushed out with water and the process repeated until the fluid is clear.

### Soldering the Radiator.

While the cost of anti-freezing solutions is not large, it is obvious that any existing leaks in the radiator, connections, etc., should be repaired to avoid the trouble of renewing the mixture. No hard and fast

rule can be laid down for this work for the design and condition of radiators vary and will require different treatment. Sometimes a leak may be stopped easily by the application of a little solder. Then again, the character of the leak may be such that the services of an expert will be required. Unless one be familiar with soldering radiators the work is best left to the expert and in this respect the best is none too good. It is an easy matter to burn the metal.

There are several chemical preparations for repairing leaky radiators, these being poured into the water, and, blending with the fluid, find every opening in the circulating system. Upon coming
